

7. Environmental conditions of the study area

7–1. Height

Table 4.

The height above the chart datum of each quadrat (QD, see Fig. 1d) was measured in April 1986. For each quadrat, the height at the four corners (NE, north-east; SE, south-east; NW, north-west; SW, south-west) is shown. The point of one corner belongs to 1–4 quadrats, and thus the same value often appears in the rows of different quadrats (e.g., SW of A1, NW of A2, SE of B1, and NE of B2).

Table 4

QD	NE	SE	NW	SW	Mean		QD	NE	SE	NW	SW	Mean
A 1	141	121	166	150	145		E 1	225	147		155	176

7–2. Water flow

Table 5.

The intensity of water flow in each quadrat (QD, see Fig. 1d). Water flow was measured as the percentage loss of weight of a plaster lump (120–130 g) fixed at each corner of a quadrat (NE, north-east; SE, south-east; NW, north-west; SW, south-west) during 24 h in a spring tide (April 26–27, 2005). The point of one corner belongs to 1–4 quadrats and thus the same value often appears in the rows of different quadrats.

Table 5

7-4. Algal cover

Table 7.

Coverage with macroalgae and the dominant macroalgal taxa in each quadrat (QD; Fig. 1d) during April or May of 2005 to 2010. Coverage (CV) was estimated visually at low tide, and assigned to one of the following four classes: 1 (<25%), 2 (25–50%), 3 (50–75%), or 4 (>75%). The dominant taxa (DT) are shown using the following abbreviations: R (red algae, Rhodophyta), B (brown algae, Phaeophyta), and G (green algae, Chlorophyta). The order of coverage by these taxa was determined intuitively in the field, and is shown using >. When two or three groups were equally abundant, the alphabetical abbreviations were punctuated. –, no data.

Table 7-1

7–5. Climatic and oceanographic data

Table 8.

Summary of the oceanographic data from 1984 to 2010 around the study site. AT, the monthly mean air temperature based on the values measured daily at St. 1 (Fig. 1b). Typhoon, the number of typhoons that entered within 1000 km and 200 km (in brackets) circles of the study site during April to November each year. These data were obtained from the website of the Japan Meteorological Agency (<http://www.data.jma.go.jp>). Nearshore WT, monthly mean of the water temperature measured daily at St. 2 (Fig. 1b) by the Seto Marine Biological Laboratory of Kyoto University. Offshore WT, water temperature measured once a month at 50 m depth at 9 offshore stations (2–20km from the coast, cross marks in Fig. 1a). Sal, salinity at 10 m depth at St. 3 (Fig. 1b). The offshore temperature and salinity were measured once a month by the Fisheries Experimental Station of Wakayama Prefecture. Kuroshio, the annual mean distance of the Kuroshio Current from Cape Shionomisaki (Fig. 1a) reported by the Maritime Safety Agency of Japan. COD, SS, T–N (total nitrogen), and T–P (total phosphorous) were measured at the surface layer of six points around St 4 (Fig. 1b) once a year between July and September by the Shirahama Municipality Government, and the mean of the six values is shown for each parameter. –, no data.

Table 8

	AT(°C)	Typhoon	Nearshore WT(°C)	Offshore WT(°C)	Sal(gsu)	Kuroshio	COD	SS	T-N	T-P
