# Note on the space of algebraic loops on a toric variety

山口耕平 (Kohhei Yamaguchi) 電気通信大学 情報理工学研究科 (University of Electro-Communications)

#### Abstract

The homotopy type of the space of rational curves on a toric variety has been well studied by several authors since the work of Segal [27] appeared (cf. [9], [10], [12], [15], [18], [25]). In this note we shall consider the real analogue of these spaces. In particular, we report about the homotopy type of spaces of algebraic loops on a toric variety. This result is based on the joint works with A. Kozlowski given in [19].

## 1 Introduction

First we shall recall several basic definitions and facts about toric topology.

**Fans and toric varieties.** A convex rational polyhedral cone  $\sigma$  in  $\mathbb{R}^n$  is a subset of  $\mathbb{R}^n$  of the form

(1.1) 
$$\sigma = \operatorname{Cone}(S) = \operatorname{Cone}(\boldsymbol{m}_1, \cdots, \boldsymbol{m}_s) = \left\{ \sum_{k=1}^s \lambda_k \boldsymbol{m}_k : \lambda_k \ge 0 \text{ for any } k \right\}$$

for a finite set  $S = \{\boldsymbol{m}_k\}_{k=1}^s \subset \mathbb{Z}^{n,1}$  A convex rational polyhedral cone  $\sigma$  is called *strongly* convex if  $\sigma \cap (-\sigma) = \{\boldsymbol{0}_n\}$ , and its dimension dim  $\sigma$  is the dimension of the smallest subspace in  $\mathbb{R}^n$  which contains  $\sigma$ . A face  $\tau$  of  $\sigma$  is a subset  $\tau \subset \sigma$  of the form

(1.2) 
$$\tau = \sigma \cap \{ \boldsymbol{x} \in \mathbb{R}^n : L(\boldsymbol{x}) = 0 \}$$

for some linear form L on  $\mathbb{R}^n$ , such that  $L(\mathbf{x}) \geq 0$  for any  $\mathbf{x} \in \sigma$ . If  $\{k : L(\mathbf{m}_k) = 0, 1 \leq k \leq s\} = \{i_1, \dots, i_t\}$ , we easily see that  $\tau = \text{Cone}(\mathbf{m}_{i_1}, \dots, \mathbf{m}_{i_t})$ . Thus, a face  $\tau$  of  $\sigma$  is also a strongly convex rational polyhedral cone if  $\sigma$  is so.

A finite collection  $\Sigma$  of strongly convex rational polyhedral cones in  $\mathbb{R}^n$  is called *a fan* in  $\mathbb{R}^n$  if every face  $\tau$  of  $\sigma \in \Sigma$  belongs to  $\Sigma$  and the intersection of any two elements of  $\Sigma$  is a face of each.

<sup>&</sup>lt;sup>1</sup>When S is the emptyset  $\emptyset$ , we set  $\text{Cone}(\emptyset) = \{\mathbf{0}_n\}$  and we may also regard it as one of strongly convex rational polyhedral cones in  $\mathbb{R}^n$ , where we denote by  $\mathbf{0}_n$  the zero vector in  $\mathbb{R}^n$  defined by  $\mathbf{0}_n = (0, \dots, 0) \in \mathbb{R}^n$ .

An *n* dimensional irreducible normal variety *X* (over  $\mathbb{C}$ ) is called *a toric variety* if it has a Zariski open subset  $\mathbb{T}^n_{\mathbb{C}} = (\mathbb{C}^*)^n$  and the action of  $\mathbb{T}^n_{\mathbb{C}}$  on itself extends to an action of  $\mathbb{T}^n_{\mathbb{C}}$  on *X*. The most significant property of a toric variety is the fact that it is characterized up to isomorphism entirely by its associated fan  $\Sigma$ . We denote by  $X_{\Sigma}$  the toric variety associated to a fan  $\Sigma$ .

Since the fan of  $\mathbb{T}^n_{\mathbb{C}}$  is  $\{\mathbf{0}_n\}$  and this case is trivial, we always assume that any fan  $\Sigma$  in  $\mathbb{R}^n$  satisfies the condition  $\{\mathbf{0}_n\} \subsetneq \Sigma$ .

**Definition 1.1.** Let  $\Sigma$  be a fan in  $\mathbb{R}^n$  such that  $\{\mathbf{0}_n\} \subsetneqq \Sigma$  and let

(1.3) 
$$\Sigma(1) = \{\rho_1, \cdots, \rho_r\}$$

denote the set of all one dimensional cones in  $\Sigma$ . For each integer  $1 \leq k \leq r$ , we denote by  $\mathbf{n}_k \in \mathbb{Z}^n$  the primitive generator of  $\rho_k$ , such that

(1.4) 
$$\rho_k \cap \mathbb{Z}^n = \mathbb{Z}_{>0} \cdot \boldsymbol{n}_k$$

Note that  $\rho_k = \operatorname{Cone}(\boldsymbol{n}_k) = \mathbb{R}_{\geq 0} \cdot \boldsymbol{n}_k$  for each  $1 \leq k \leq r$ .

**Polyhedral products and homogenous coordinates.** Next, recall the definition of polyhedral products and homogenous coordinates of toric varieties.

**Definition 1.2.** Let K be a simplicial complex on the vertex set  $[r] = \{1, 2, \dots, r\}, ^2$  and let (X, A) be a pair of based spaces such that  $A \subset X$ .

(i) Let  $\mathcal{Z}_K(X, A)$  denote the polyhedral product of the pair (X, A) with respect to K given by the union

(1.5) 
$$\mathcal{Z}_K(X,A) = \bigcup_{\sigma \in K} (X,A)^{\sigma}$$

where we set  $(X, A)^{\sigma} = \{(x_1, \cdots, x_r) \in X^r : x_k \in A \text{ if } k \notin \sigma\}.$ 

When  $(X, A) = (D^2, S^1)$ , we write  $\mathcal{Z}_K = \mathcal{Z}_K(D^2, S^1)$  and it is called the moment-angle complex of K.

(ii) For a fan  $\Sigma$  in  $\mathbb{R}^n$ , let  $\mathcal{K}_{\Sigma}$  denote the underlying simplicial complex of  $\Sigma$  defined by

(1.6) 
$$\mathcal{K}_{\Sigma} = \left\{ \{i_1, \cdots, i_s\} \subset [r] : \operatorname{Cone}(\boldsymbol{n}_{i_1}, \boldsymbol{n}_{i_2}, \cdots, \boldsymbol{n}_{i_s}) \in \Sigma \right\}.$$

Note that  $\mathcal{K}_{\Sigma}$  is a simplicial complex on the vertex set [r].

(iii) Let  $G_{\Sigma} \subset \mathbb{T}_{\mathbb{C}}^r = (\mathbb{C}^*)^r$  denote the multiplicative subgroup of  $\mathbb{T}_{\mathbb{C}}^r$  defined by

(1.7) 
$$G_{\Sigma} = \{(\mu_1, \cdots, \mu_r) \in \mathbb{T}^r_{\mathbb{C}} : \prod_{k=1}^r (\mu_k)^{\langle \boldsymbol{n}_k, \boldsymbol{m} \rangle} = 1 \text{ for all } \boldsymbol{m} \in \mathbb{Z}^n \}.$$

<sup>&</sup>lt;sup>2</sup>Let K be some set of subsets of [r]. Then the set K is called an abstract simplicial complex on the vertex set [r] if the following condition holds: if  $\tau \subset \sigma$  and  $\sigma \in K$ , then  $\tau \in K$ . In this paper by a simplicial complex K we always mean an an abstract simplicial complex, and we always assume that a simplicial complex K contains the empty set  $\emptyset$ .

where  $\langle , \rangle$  denotes the standard inner product on  $\mathbb{R}^n$  given by  $\langle \boldsymbol{u}, \boldsymbol{v} \rangle = \sum_{k=1}^n u_k v_k$  for  $\boldsymbol{u} = (u_1, \cdots, u_n)$  and  $\boldsymbol{v} = (v_1, \cdots, v_n) \in \mathbb{R}^n$ .

(iv) Consider the natural  $G_{\Sigma}$ -action on  $\mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)$  given by coordinate-wise multiplication, i.e.  $\mu \cdot \boldsymbol{x} = (\mu_1 x_1, \cdots, \mu_r x_r)$  for  $(\mu, \boldsymbol{x}) = ((\mu_1, \cdots, \mu_r), (x_1, \cdots, x_r)) \in G_{\Sigma} \times \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)$ . We denote by  $\mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)/G_{\Sigma}$  the corresponding orbit space and let

(1.8) 
$$q_{\Sigma}: \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*) \to \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)/G_{\Sigma}$$

denote the canonical projection.

**Lemma 1.3** ([6], [7], [19]). Suppose that the set  $\{\mathbf{n}_k\}_{k=1}^r$  of all primitive generators spans  $\mathbb{R}^n$  (i.e.  $\sum_{k=1}^r \mathbb{R} \cdot \mathbf{n}_k = \mathbb{R}^n$ ).

(i) There is a natural isomorphism

(1.9) 
$$X_{\Sigma} \cong \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)/G_{\Sigma}$$

(ii) If  $f : \mathbb{C}P^m \to X_{\Sigma}$  is a holomorphic map, there exists an r-tuple  $D = (d_1, \dots, d_r) \in (\mathbb{Z}_{\geq 0})^r$  of non-negative integers satisfying the condition  $\sum_{k=1}^r d_k \mathbf{n}_k = \mathbf{0}$  and homogenous polynomials  $f_i \in \mathbb{C}[z_0, \dots, z_m]$  of degree  $d_i$   $(i = 1, 2, \dots, r)$  such that polynomials  $\{f_i\}_{i \in \sigma}$  have no common root except  $\mathbf{0} \in \mathbb{C}^{m+1}$  for each  $\sigma \in I(\mathcal{K}_{\Sigma})$  and that the diagram

is commutative, where  $\gamma_m : \mathbb{C}^{m+1} \setminus \{\mathbf{0}\} \to \mathbb{C}P^m$  denotes the canonical Hopf fibering and the map  $q_{\Sigma}$  is a canonical projection induced from the identification (1.9). In this case, we call this holomorphic map f as a holomorphic map of degree  $D = (d_1, \dots, d_r)$  and we represent it as

$$(1.11) f = [f_1, \cdots, f_r].$$

Moreover, if  $g_i \in \mathbb{C}[z_0, \dots, z_m]$  is a homogenous polynomial of degree  $d_i$   $(1 \leq i \leq r)$  such that  $f = [f_1, \dots, f_r] = [g_1, \dots, g_r]$ , there exists some element  $(\mu_1, \dots, \mu_r) \in G_{\Sigma}$  such that  $f_i = \mu_i \cdot g_i$  for each  $1 \leq i \leq r$ . Thus, such r-tuple  $(f_1, \dots, f_r)$  of homogenous polynomials representing the holomorphic map f is uniquely determined up to  $G_{\Sigma}$ -action.

(iii) Let  $h_k \in \mathbb{C}[z_0, \dots, z_m]$  be a homogenous polynomial of the degree  $d_k$  for each  $1 \leq k \leq r$  such that the polynomials  $\{h_k\}_{k \in \sigma}$  have no common real root except  $\mathbf{0}_{m+1} \in \mathbb{R}^{m+1}$  for each  $\sigma \in I(\mathcal{K}_{\Sigma})$ . Then there is a unique map  $h : \mathbb{R}P^m \to X_{\Sigma}$  such that the following diagram

(1.12) 
$$\begin{array}{ccc} \mathbb{R}^{m+1} \setminus \{\mathbf{0}\} & \xrightarrow{(h_1, \cdots, h_r)} & \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*) \\ & & & & & \\ \gamma_{m,\mathbb{R}} \downarrow & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ \mathbb{R}\mathrm{P}^m & \xrightarrow{h} & \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)/G_{\Sigma} = X_{\Sigma} \end{array}$$

is commutative if and only if  $\sum_{k=1}^{r} d_k \mathbf{n}_k = \mathbf{0}_n$ , where  $\gamma_{m,\mathbb{R}} : \mathbb{R}^{m+1} \setminus \{\mathbf{0}\} \to \mathbb{R}P^m$  denotes the canonical double covering.

**Remark 1.4.** We call the map h determined by an r-tuple  $(h_1, \dots, h_r)$  of homogenous polynomials given in (iii) of Lemma 1.3 as an algebraic map and we write  $h = [h_1, \dots, h_r]$ .

Note that two different such *r*-tuples of polynomials can determine the same maps. In fact, if we multiply all polynomials in such an *r*-tuple by the same polynomial which does not have any real roots except  $\mathbf{0}_m$ , we obtain the same algebraic map. For example, suppose that  $(h_1, \dots, h_r)$  is the *r*-tuple of homogenous polynomials in  $\mathbb{C}[z_0, \dots, z_m]$  of degree  $d_1, \dots, d_r$  satisfying the same condition as before. If  $(a_1, \dots, a_r) \in \mathbb{N}^r$  is the *r*-tuple of positive integers and it satisfies the condition  $\sum_{k=1}^r a_k \mathbf{n}_k = \mathbf{0}_n$ , we can easily see that  $h = [h_1, \dots, h_r] = [(g_1)^{a_1}h_1, \dots, (g_1)^{a_r}h_r] = [(g_2)^{a_1}h_1, \dots, (g_2)^{a_r}h_r]$  for  $g_1 = \sum_{k=0}^m z_k^2$  and  $g_2 = (z_0 + z_1)^2 + \sum_{k=2}^m z_k^2$ .

**Assumptions.** Let  $\Sigma$  be a fan in  $\mathbb{R}^n$  satisfying the condition (1.3) as in Definition 1.1. From now on, we assume that the following two conditions hold.

- (1.9.1) There is an *r*-tuple  $D_* = (d_1^*, \cdots, d_r^*) \in \mathbb{N}^r$  of positive integers such that  $\sum_{k=1}^r d_k^* \mathbf{n}_k = \mathbf{0}_n$ .
- (1.9.2) The set  $\{\boldsymbol{n}_k\}_{k=1}^r$  of primitive generators spans  $\mathbb{Z}^n$  over  $\mathbb{Z}$ .

**Remark 1.5.** Note that  $X_{\Sigma}$  is a compact iff  $\bigcup_{\sigma \in \Sigma} \sigma = \mathbb{R}^n$ . Note also that  $X_{\Sigma}$  is simply connected if and only if  $\sum_{k=1}^r \mathbb{Z} \cdot \mathbf{n}_k = \mathbb{Z}^n$ . Hence, the condition (1.9.2) always holds if  $X_{\Sigma}$  is compact or simply connected. On the other hand, if the condition (1.9.2) holds, one can easily see that the set  $\{\mathbf{n}_k\}_{k=1}^r$  spans  $\mathbb{R}^n$  over  $\mathbb{R}$ , and there is an isomorphism (1.9) for the space  $X_{\Sigma}$ . Moreover, we know that the condition (1.9.1) holds if  $X_{\Sigma}$  is compact and non-singular [7, Theorem 3.1].

**Remark 1.6.** Let  $\Sigma$  denote the fan in  $\mathbb{R}^2$  given by  $\Sigma = \{\{\mathbf{0}_2\}, \operatorname{Cone}(\mathbf{e}_1), \operatorname{Cone}(\mathbf{e}_2)\}$  for the standard basis  $\mathbf{e}_1 = (1,0), \mathbf{e}_2 = (0,1)$ . Then the toric variety  $X_{\Sigma}$  of  $\Sigma$  is  $\mathbb{C}^2$  which has trivial homogenous coordinates. It is clearly a (simply connected) smooth toric variety, and the condition (1.9.1) also holds. However, in this case,  $\sum_{k=1}^2 d_k \mathbf{n}_k = \mathbf{0}_2$  iff  $(d_1, d_2) = (0, 0)$ . Hence, it follows from Lemma 1.3 that there are no algebraic maps  $\mathbb{RP}^m \to X_{\Sigma} = \mathbb{C}^2$ other than the constant maps. Assuming the condition (1.9.1) guarantees the existence of non-trivial algebraic maps  $\mathbb{RP}^m \to X_{\Sigma}$ . Of course, it would be sufficient to assume that  $D = (d_1, \ldots, d_r) \neq (0, \ldots, 0)$  but if  $d_i = 0$  for some i, then the number  $d(D, \Sigma)$  (defined in (2.2)) is not a positive integer and our assertion (Theorem 2.2 below) is vacuous. For this reason, we will assume the condition  $d_k^* \geq 1$  for each  $1 \leq k \leq r$  in (1.9.1).

Let  $X_{\Sigma}$  be a non-singular toric variety and make the identification

(1.13) 
$$X_{\Sigma} = \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*) / G_{\Sigma}.$$

Let  $z_0, \dots, z_m$  be variables. Now we consider the space of all tuples of polynomials which define based algebraic maps.

**Definition 1.7.** (i) For each  $d, m \in \mathbb{N}$ , let  $\mathcal{H}_m^d(\mathbb{C})$  denote the space of all homogenous polynomials  $f(z_0, \dots, z_m) \in \mathbb{C}[z_0, \dots, z_m]$  of degree d.

(ii) For each r-tuple  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$ , let  $\operatorname{Pol}_D^*(\mathbb{R}P^m, X_{\Sigma})$  denote the space of r-tuples  $f = (f_1(z_0, \dots, z_m), \dots, f_r(z_0, \dots, z_m)) \in \mathcal{H}_m^{d_1}(\mathbb{C}) \times \dots \times \mathcal{H}_m^{d_r}(\mathbb{C})$  of homogenous polynomials satisfying the following two conditions:

(1.14.1) 
$$f(\boldsymbol{x}) = (f_1(\boldsymbol{x}), \cdots, f_r(\boldsymbol{x})) \in U(\mathcal{K}_{\Sigma})$$
 for any point  $\boldsymbol{x} = (x_0, \cdots, x_m) \in \mathbb{R}^{m+1} \setminus \{\mathbf{0}_{m+1}\}.$ 

(1.14.2)  $f(\boldsymbol{e}_1) = (f_1(\boldsymbol{e}_1), \cdots, f_r(\boldsymbol{e}_1)) = (1, 1, \cdots, 1)$ , where  $\boldsymbol{e}_1 = (1, 0, \cdots, 0) \in \mathbb{R}^{m+1}$ .

**Definition 1.8.** We always assume the identification  $X_{\Sigma} = U(\mathcal{K}_{\Sigma})/G_{\Sigma}$ , and denote by  $[y_1, \dots, y_r]$  the point in  $X_{\Sigma}$  represented by  $(y_1, \dots, y_r) \in U(\mathcal{K}_{\Sigma})$ . Moreover, we choose the two points  $[1:0:\dots:0] \in \mathbb{R}P^m$  and  $* = [1,\dots,1] \in X_{\Sigma}$  as the base-points of  $\mathbb{R}P^m$  and  $X_{\Sigma}$  respectively.

Let  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$  be an *r*-tuple of positive integers such that  $\sum_{k=1}^r d_k \mathbf{n}_k = \mathbf{0}_n$ . Then by using Lemma 1.3, for each *r*-tuple

$$f = (f_1(z_0, \cdots, z_m), \cdots, f_r(z_0, \cdots, z_m)) \in \operatorname{Pol}_D^*(\mathbb{R}P^m, X_{\Sigma})$$

one can define based algebraic map

(1.14) 
$$[f] = [f_1, \cdots, f_r] : (\mathbb{R}P^m, [\boldsymbol{e}_1]) \to (X_{\Sigma}, *) \quad \text{by}$$

(1.15) 
$$[f]([\mathbf{x}]) = [f_1(\mathbf{x}), \cdots, f_r(\mathbf{x})]$$

for  $[\boldsymbol{x}] = [x_0 : \cdots : x_m] \in \mathbb{R}P^m$ , where  $\boldsymbol{x} = (x_0, \cdots, x_m) \in \mathbb{R}^{m+1} \setminus \{\boldsymbol{0}_{m+1}\}$ . Hence, we denote by  $\operatorname{Map}_D^*(\mathbb{R}P^m, X_{\Sigma})$  the path-component of  $\operatorname{Map}^*(\mathbb{R}P^m, X_{\Sigma})$  which contains all algebraic maps of degree D, and we obtain the natural map

(1.16) 
$$i_{D,m} : \operatorname{Pol}_D^*(\mathbb{R}P^m, X_{\Sigma}) \to \operatorname{Map}_D^*(\mathbb{R}P^m, X_{\Sigma})$$

given by

(1.17) 
$$i_{D,m}(f) = [f] = [f_1, \cdots, f_r]$$

for  $f = (f_1(z_0, \cdots, z_m), \cdots, f_r(z_0, \cdots, z_m)) \in \operatorname{Pol}_D^*(\mathbb{R}P^m, X_{\Sigma}),$ 

When m = 1, we make the identification  $\mathbb{RP}^1 = S^1 = \mathbb{R} \cup \infty$  and choose the points  $\infty$  as the base-point of  $\mathbb{RP}^1$ . Then, by setting  $z = \frac{z_0}{z_1}$ , we can view a homogenous polynomial  $f(z_0, z_1) \in \mathbb{C}[z_0, z_1]$  of degree d as a monic polynomial  $f_k(z) \in \mathbb{C}[z]$  of degree d. Thus, when m = 1, one can redefine the space  $\mathrm{Pol}_D^n(S^1, X_{\Sigma})$  as follows.

**Definition 1.9.** (i) Let  $P^d$  denote the space of all monic polynomials  $f(z) = z^d + a_1 z^{d-1} + \cdots + a_{d-1} z + a_d \in \mathbb{C}[z]$  of degree d, and let

(1.18) 
$$\mathbf{P}^D = \mathbf{P}^{d_1} \times \mathbf{P}^{d_2} \times \dots \times \mathbf{P}^{d_r}.$$

Note that there is a homeomorphism  $\phi : \mathbb{P}^d \cong \mathbb{C}^d$  given by  $\phi(z^d + \sum_{k=1}^d a_k z^{d-k}) = (a_1, \cdots, a_d) \in \mathbb{C}^d$ .

(ii) For any r-tuple  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$ , let  $\operatorname{Pol}_D^*(S^1, X_{\Sigma})$  denote the space of all r-tuples  $(f_1(z), \dots, f_r(z)) \in \mathbb{P}^D$  of monic polynomials satisfying the following condition  $(\dagger)$ :

(†) The polynomials  $f_{i_1}(z), \dots, f_{i_s}(z)$  have no common real root for any  $\sigma = \{i_1, \dots, i_s\} \in I(\mathcal{K}_{\Sigma})$ , i.e.  $(f_{i_1}(\alpha), \dots, f_{i_s}(\alpha)) \neq \mathbf{0}_s$  for any  $\alpha \in \mathbb{R}$ .

When the condition  $\sum_{k=1}^{r} d_k \mathbf{n}_k = \mathbf{0}_n$  holds, by identifying  $X_{\Sigma} = \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*)/G_{\Sigma}$  and  $\mathbb{R}\mathrm{P}^1 = S^1 = \mathbb{R} \cup \infty$ , one can define a natural map

(1.19) 
$$i_D = i_{D,1} : \operatorname{Pol}^*_D(S^1, X_{\Sigma}) \to \operatorname{Map}^*(S^1, X_{\Sigma}) = \Omega X_{\Sigma} \quad \text{by}$$

(1.20) 
$$i_D(f_1(z), \cdots, f_r(z))(\alpha) = \begin{cases} [f_1(\alpha), \cdots, f_r(\alpha)] & \text{if } \alpha \in \mathbb{R} \\ [1, 1, \cdots, 1] & \text{if } \alpha = \infty \end{cases}$$

for  $(f_1(z), \dots, f_r(z)) \in \operatorname{Pol}_D^*(S^1, X_{\Sigma})$  and  $\alpha \in S^1 = \mathbb{R} \cup \infty$ , where we choose the points  $\infty$  and  $[1, 1, \dots, 1]$  as the base-points of  $S^1$  and  $X_{\Sigma}$ .

Note that  $\operatorname{Pol}_D^*(S^1, X_{\Sigma})$  is simply connected and that the map  $\Omega q_{\Sigma} : \Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*) \to \Omega X_{\Sigma}$  is a universal covering. Thus, when  $\sum_{k=1}^r d_k \mathbf{n}_k = \mathbf{0}_n$ , the map  $i_D$  lifts to the space  $\Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}(\mathbb{C}, \mathbb{C}^*) \simeq \Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}$  and there is a map

(1.21) 
$$j_D : \operatorname{Pol}_D^*(S^1, X_{\Sigma}) \to \Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}$$

such that

(1.22) 
$$\Omega q_{\Sigma} \circ j_D = i_D.$$

**Remark 1.10.** Even if  $\sum_{k=1}^{r} d_k n_k \neq 0_n$  we can define the two maps

$$i_D : \operatorname{Pol}^*_D(S^1, X_{\Sigma}) \to \Omega X_{\Sigma}, \ j_D : \operatorname{Pol}^*_D(S^1, X_{\Sigma}) \to \Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}$$

by using stabilization maps. The detail is given in [19].

Now we need to define the numbers  $r_{\min}(\Sigma)$  and  $d(D, \Sigma)$ .

**Definition 1.11.** Let  $\Sigma$  be a fan in  $\mathbb{R}^n$  as in Definition 1.1.

(i) We say that a set  $S = \{ \boldsymbol{n}_{i_1}, \cdots, \boldsymbol{n}_{i_s} \}$  is primitive in  $\Sigma$  if  $\text{Cone}(S) \notin \Sigma$  but  $\text{Cone}(T) \in \Sigma$  for any proper subset  $T \subsetneqq S$ .

(ii) For  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$  define integers  $r_{\min}(\Sigma)$  and  $d(D, \Sigma; m)$  by

(1.23) 
$$\begin{cases} r_{\min}(\Sigma) &= \min\{s \in \mathbb{N} : \{\boldsymbol{n}_{i_1}, \cdots, \boldsymbol{n}_{i_s}\} \text{ is primitive in } \Sigma\},\\ d(D, \Sigma; m) &= (2r_{\min}(\Sigma) - m - 1)d_{\min} - 2, \text{ where } d_{\min} = \min\{d_1, \cdots, d_r\}. \end{cases}$$

**Definition 1.12.** Recall that a map  $g: V \to W$  is called a homology (resp. homotopy) equivalence through dimension N if the induced homomorphism  $g_*: H_k(V; \mathbb{Z}) \to H_k(W; \mathbb{Z})$ (resp.  $g_*: \pi_k(V) \to \pi_k(W)$ ) is an isomorphism for all  $k \leq N$ .

Now recall the following result.

**Theorem 1.13** ([13]). Let  $m \ge 2$  be a positive integer,  $X_{\Sigma}$  be a compact smooth toric variety and  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$  be an *r*-tuple of positive integers such that  $\sum_{k=1}^r d_k \mathbf{n}_k = \mathbf{0}_n$ . Then the natural map  $i_{D,m} : \operatorname{Pol}_D^*(\mathbb{R}P^m, X_{\Sigma}) \to \operatorname{Map}_D^*(\mathbb{R}P^m, X_{\Sigma})$  is a homology equivalence through dimension  $d(D, \Sigma; m)$ .

Note that the above result does not hold for the case m = 1. For example, this can be seen in [11] for the case  $X_{\Sigma} = \mathbb{C}\mathbb{P}^n$ . In fact, the main purpose of this paper is to investigate the result corresponding to this theorem for the case m = 1.

## 2 Main results

**Previous results.** First, recall the following result concerning to the homotopy type of space of rational curves one a toric variety.

**Theorem 2.1** ([18]). Let  $X_{\Sigma}$  be a simply connected non-singular toric variety associated to the fan  $\Sigma$  such that the condition (1.9.1) is satisfied. Then if  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$  and  $\sum_{k=1}^r d_k \mathbf{n}_k = \mathbf{0}_n$ , the inclusion map

$$i_{D,hol}: \operatorname{Hol}_D^*(S^2, X_{\Sigma}) \xrightarrow{\subset} \Omega_D^2 X_{\Sigma}$$

is a homotopy equivalence through dimension  $d_*(D, \Sigma)$  if  $r_{\min}(\Sigma) \geq 3$  and a homology equivalence through dimension  $d_*(D, \Sigma) = d_{\min} - 2$  if  $r_{\min}(\Sigma) = 2$ .

Here,  $\Omega_D^2 X_{\Sigma}$  (resp.  $\operatorname{Hol}_D^*(S^2, X_{\Sigma})$ ) denotes the space of based continuous (resp. based holomorphic) maps from  $S^2$  to  $X_{\Sigma}$  of degree D, and  $d_*(D, \Sigma)$  is the number given by

(2.1) 
$$d_*(D, \Sigma) = (2r_{\min}(\Sigma) - 3)d_{\min} - 2, \text{ where } d_{\min} = \min\{d_1, \cdots, d_r\}.$$

The main results of this note. The main result of this paper is to consider the real analogue of the above result and this is stated as follows.

**Theorem 2.2** ([19]). Let  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$  be an r-tuple of positive integers and let  $X_{\Sigma}$  be a simply connected non-singular toric variety such that the condition (1.9.1) holds. Then there is map

$$j_D: \operatorname{Pol}^*_D(S^1, X_\Sigma) \to \Omega \mathcal{Z}_{\mathcal{K}_\Sigma}$$

which is a homotopy equivalence through dimension  $d(D, \Sigma)$ , where the number  $d(D, \Sigma)$  is given by

(2.2) 
$$d(D, \Sigma) = d(D, \Sigma; 1) = (2r_{\min}(\Sigma) - 2)d_{\min} - 2.$$

**Corollary 2.3** ([19]). Under the same assumption as in Theorem 2.2, there is the map  $i_D : \operatorname{Pol}_D^*(S^1, X_{\Sigma}) \to \Omega X_{\Sigma}$  induces an isomorphism

$$(i_D)_* : \pi_k(\operatorname{Pol}_D^*(S^1, X_\Sigma)) \xrightarrow{\cong} \pi_k(\Omega X_\Sigma) \cong \pi_{k+1}(X_\Sigma)$$

for any  $2 \leq k \leq d(D, \Sigma)$ .

**Corollary 2.4** ([19]). Let  $D = (d_1, \dots, d_r) \in \mathbb{N}^r$  be an *r*-tuple of positive integers satisfying the condition  $\sum_{k=1}^r d_k \mathbf{n}_k = \mathbf{0}_n$ , and let  $X_{\Sigma}$  be a simply connected compact non-singular toric variety. Let  $\Sigma(1)$  denote the set of all one dimensional cones in  $\Sigma$ , and  $\Sigma_1$  any fan in  $\mathbb{R}^n$ such that  $\Sigma(1) \subset \Sigma_1 \subsetneq \Sigma$ .

(i) Then  $X_{\Sigma_1}$  is a non-singular open toric subvariety of  $X_{\Sigma}$  and there is the map

$$j_D: \operatorname{Pol}_D^*(S^1, X_{\Sigma_1}) \to \Omega \mathcal{Z}_{\Sigma_1}$$

which is a homotopy equivalence through dimension  $d(D, \Sigma_1)$ .

(ii) Moreover, there is the map  $i_D : \operatorname{Pol}_D^*(S^1, X_{\Sigma_1}) \to \Omega X_{\Sigma_1}$  which induces the isomorphism

$$(i_D)_* : \pi_k(\operatorname{Pol}_D^*(S^1, X_{\Sigma_1})) \xrightarrow{\cong} \pi_k(\Omega X_{\Sigma_1}) \cong \pi_{k+1}(X_{\Sigma_1})$$

for any  $2 \leq k \leq d(D, \Sigma_1)$ .

**Examples.** Finally consider the example of the main results. Since the case  $X_{\Sigma} = \mathbb{CP}^n$  was already well known, we consider the case that  $X_{\Sigma}$  is the Hirzerbruch surface H(k).

**Definition 2.5.** For an integer  $k \in \mathbb{Z}$ , let H(k) be the Hirzerbruch surface defined by

 $H(k) = \left\{ ([x_0 : x_1 : x_2], [y_1 : y_2]) \in \mathbb{C}\mathrm{P}^2 \times \mathbb{C}\mathrm{P}^1 : x_1 y_1^k = x_2 y_2^k \right\} \subset \mathbb{C}\mathrm{P}^2 \times \mathbb{C}\mathrm{P}^1.$ 

Since there are isomorphisms  $H(-k) \cong H(k)$  for  $k \neq 0$  and  $H(0) \cong \mathbb{CP}^1 \times \mathbb{CP}^1$ , without loss of generality we can assume that  $k \geq 1$ . Let  $\Sigma_k$  denote the fan in  $\mathbb{R}^2$  given by

$$\Sigma_k = \big\{ \operatorname{Cone}(\mathbf{n}_i, \mathbf{n}_{i+1}) \ (1 \le i \le 3), \operatorname{Cone}(\mathbf{n}_4, \mathbf{n}_1), \operatorname{Cone}(\mathbf{n}_j) \ (1 \le j \le 4), \ \{\mathbf{0}\} \big\},\$$

where we set  $\mathbf{n}_1 = (1, 0), \ \mathbf{n}_2 = (0, 1), \ \mathbf{n}_3 = (-1, k), \ \mathbf{n}_4 = (0, -1).$ 

It is easy to see that  $\Sigma_k$  is the fan of H(k) and that H(k) is a compact non-singular toric variety. Note that  $\Sigma_k(1) = \{\text{Cone}(\mathbf{n}_i) : 1 \le i \le 4\}$ . Since  $\{\mathbf{n}_1, \mathbf{n}_3\}$  and  $\{\mathbf{n}_2, \mathbf{n}_4\}$  are only primitive in  $\Sigma_k$ ,  $r_{\min}(\Sigma_k) = 2$ .

Moreover, for  $D = (d_1, d_2, d_3, d_4) \in \mathbb{N}^4$  the equality  $\sum_{k=1}^4 d_k \mathbf{n}_k = \mathbf{0}_2$  holds iff  $(d_3, d_4) = (d_1, kd_1 + d_2)$ . Thus, if  $\sum_{k=1}^4 d_k \mathbf{n}_k = \mathbf{0}_2$ , we have  $d_{\min} = \min\{d_1, d_2, d_3, d_4\} = \min\{d_1, d_2\}$ .

**Example 2.6.** Let  $D = (d_1, d_2, d_3, d_4) \in \mathbb{N}^4$ ,  $k \in \mathbb{N}$ , and  $\Sigma$  be a fan in  $\mathbb{R}^2$  such that  $\Sigma_k(1) = \{\text{Cone}(\boldsymbol{n}_i) : 1 \leq i \leq 4\} \subset \Sigma \subset \Sigma_k$  as in Definition 2.5.

(i)  $X_{\Sigma}$  is a non-singular open toric subvariety of H(k) if  $\Sigma \subsetneq \Sigma_k$ .

(ii) If  $\sum_{k=1}^{4} d_k \mathbf{n}_k = \mathbf{0}_2$ , the equality  $(d_3, d_4) = (d_1, kd_1 + d_2)$  holds and the map  $j_D$ :  $\operatorname{Pol}_D^*(S^1, X_{\Sigma}) \to \Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}$  is a homotopy equivalence through dimension  $2\min\{d_1, d_2\} - 2$ . Moreover, the map  $i_D : \operatorname{Pol}_D^*(S^1, X_{\Sigma}) \to \Omega X_{\Sigma}$  induces an isomorphism

$$(i_D)_* : \pi_k(\operatorname{Pol}_D^*(S^1, X_\Sigma)) \xrightarrow{\cong} \pi_k(\Omega X_\Sigma) \cong \pi_{k+1}(X_\Sigma)$$

for any  $2 \le k \le 2 \min\{d_1, d_2\} - 2$ .

(iii) If  $\sum_{k=1}^{4} d_k \mathbf{n}_k \neq \mathbf{0}_2$ , there is a map  $j_D : \operatorname{Pol}_D^*(S^1, X_{\Sigma}) \to \Omega \mathcal{Z}_{\mathcal{K}_{\Sigma}}$  which is a homotopy equivalence through dimension  $2\min\{d_1, d_2, d_3, d_4\} - 2$ , and there is a map  $i_D : \operatorname{Pol}_D^*(S^1, X_{\Sigma}) \to \Omega X_{\Sigma}$  which induces an isomorphism

$$(i_D)_* : \pi_k(\operatorname{Pol}_D^*(S^1, X_\Sigma)) \xrightarrow{\cong} \pi_k(\Omega X_\Sigma) \cong \pi_{k+1}(X_\Sigma)$$

for any  $2 \le k \le 2 \min\{d_1, d_2, d_3, d_4\} - 2$ .

**Remark 2.7.** As we considered as above, the space  $\operatorname{Pol}_D^*(S^1, X_{\Sigma})$  can be regarded as one of real analogues of the space  $\operatorname{Hol}_D^*(S^2, X_{\Sigma})$ . In our previous paper [17], we investigate the homotopy type of the space  $\operatorname{Poly}_n^{d,m}(\mathbb{C})$  of resultants of bounded multiplicity. We can also consider the real analogues of it, and we shall investigate the homotopy types of them in the subsequent papers ([20], [21]).
