1. 研究成果の概要

1. はじめに

オーストラリア、Northern Territory の中心都市である Darwin の沖に Tiwi Islands と呼ばれる、狭い海峡をはさんだ二つの島(Buthurst, Melville)があり、この上空に孤立型の巨大積乱雲が現れる(現地では Hector と呼ばれている)。2001 年 10-12 月に Darwin 周辺で、積乱雲による大気波動励起に関する国際協同観測キャンペーンが行われ、多くの観測装置が投入された。京大 RASC は豪州気象庁(BOM; Bureau of Meteorology)、Monash 大、Adelaide 大と共同で 5 日間のラジオゾンデ観測を Darwin 周辺の 3 点で 3 回にわたって実施した。初期解析の結果、対流圏界面のすぐ上層(15-20km)で周期が約 84 時間の変動が認められた。また、鉛直スケールが 3km以下の温度・風速変動の分散値から推定した大気重力波のエネルギーは、高度 20-25km でやや弱く、その上下の層(15-20km、25-30km)で増大しており、背景の東西風の大きさと相関が見られた。これらの波動特性は 3 期間で共通して認められた。

図1 DAWEX の気球観測点。(A) Pirlangimpi (Garden Point) (緯度 11.4S、経度 130.3E、慣性 周期 61 hr)、(B) Darwin 空港気象ステーション (12.4S, 130.9E, 56 hr, A からの距離 130 km)、(C) Katherine 空港 (14.5S, 132.5E, 48 hr, 同 400km)。

2. 観測状況

DAWEX では対流圏から中層大気さらに熱圏下部に至る広い高度領域で波動特性を観測するために、多くの観測装置が導入された。まず、対流圏では Darwin 郊外で定常的に運用されている 50MHz の Windprofiler と 915MHz の境界層レーダーに加えて、新たに Tiwi Island に 50MHZ

の小型境界層レーダーが設置された。C帯の 2 重偏波ドップラーレーダー (C-Pol) については、 Darwin 空港での定常観測に加えて、それから約 20km 北東に離れた Gun Point で、研究用の C-Pol レーダーが 11 月と 12 月のキャンペーン期間中に運用された。

成層圏観測のために 5 日間のラジオゾンデキャンペーンを乾季(Pre-Monsoon)に 1 回、Hector 季から Monsoon-onset 季に 2 回実施した(後述)。なお、Darwin では定常観測が行われている(風速は 1 日に 4 回、そのうち 2 回は温湿度等も測定)。さらに、中間圏・下部熱では MF レーダーおよび各種の CCD イメージャが稼動した。

気球観測は、Hector からの波動伝播を調べるために、Tiwi Island から南東方向にほぼ直線的に並んだ3つの球観測点で行った。つまり、 (A)Tiwi Island 上の Pirlangimpi (Garden Point)、(B) Darwin 測候所、および(C)Katherine 空港の3点である。モンスーンオンセット(10 月末)以降 12 月頃までの時期に Hector が現れると期待される。

Hector の有無による大気波動励起の相違を比較することを目指し、乾季である 10 月中旬 (10 月 13-18 日) に観測を行い、次いで Hector 季である 11 月後半 (11 月 15-20 日) と 12 月中旬 (12 月 11-16 日) に、5 日間にわたり、3 ケ所から 3 時間毎に 40 回、ラジオゾンデを放球した。なお、CCD イメージャ観測を考慮して、観測期間を新月前後にしている。

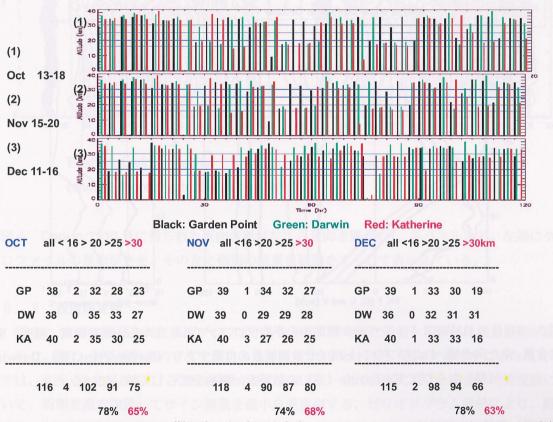

図 2 DAWEX キャンペーン期間中の気球到達高度。(1) 10 月 13-18 日、(2)11 月 15-20 日、(3)12 月 11-16 日の結果であり、横軸は 120 時間に対応する。下表の統計は気球破裂高度が 16km 以下、高度 20, 25, 30km を越えた数を各キャンペーン期間毎に示す。

図2に気球到達高度の統計を示すが、3/4以上が高度 25km に達し、さらに約 2/3 が 30km を越えたことが分かる。BOM が定常観測に用いている 350g の気球では 20km 程度しか上がらないため、800g の気球を用いた(TX-800)。しかし、11 月の観測では一日周期で最高高度が変動している。熱帯域では、対流圏界面付近で大変低温になるため、太陽放射で暖められない夜間に、気球が割れやすくなることによる。10 月にその傾向が見られなかったのは、対流圏界面温度がさほど低温でなかったことと、対流圏内が乾燥していたためと考えられる(水分の結露・凍結が重要らしい)。12 月では観測開始の 2 日後から、通称「油漬け」と呼ばれる事前処理をしたために、この問題がある程度解決した。つまり、ケロシンで気球表面を 1-2 分洗い、その後 15 分間程度乾燥した後に放球した結果、夜間でも高度 30km 付近まで到達した。しかし、気球のゴムがふやけたようになり、充填するガス量は2割程度増加した。

3. 解析結果

観測データを整理したばかりであり、詳細なデータ解析を進めている段階であるが、以下に 背景の大気状態、長周期の変動および短周期変動(大気重力波)の特性について、クイック ルックを紹介する。

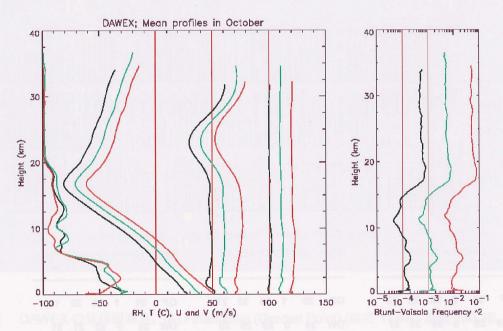

図3 10月のDAWEXキャンペーン期間中の平均プロファイル。左から、相対湿度、温度、東向き風、来た向き風、およびブラントバイサラ周波数の自乗であり、Garden Point (黒)、Darwin (緑) ならびに Katherine (赤) の結果を、横軸をずらして描いている。

3.1 背景の大気状態

図3に10月のキャンペーン時に観測された5日間平均のプロファイルを示す。モンスーン開始前なので、湿度は比較的低く、対流圏中層・上層は乾燥している。温度構造も熱帯域の特徴的

な高度プロファイルを示し、対流圏界面付近の温度は-80度 C 以下になっている。大気安定度は、15-17km でほぼ高度に線形に上昇しており、その上下の層でほぼ一定の値を示している。東西風には高度 20-25km 付近に QBO の影響による東風が見られる。一方、南北風は全高度でほぼ 0 であった。11 月と 12 月の平均プロファイルは、基本的にはでは図 3 と同様であるが、モンスーンの進行に伴い湿度が急増している。また、QBOI による東風の中心高度が若干降下していた。

Wind Velocity Profiles at Darwin during October 13-18, 2001

Eastward wind velocity (shifted according to the launch time)

230 260 290

80 110 140 170 u-East component (m/s)

Northward wind velocity

90 120 150 160 v-North component (m/s) 240

図4 Darwin で 10 月に得られた東向き風(左)と北向き風(右)。各パネルとも、左端に全プロファイルの重ねがきを、その左に個別の結果を横軸をずらして表示している。

-30

3. 2 長周期変動

-10 20

図4に10月に観測された風速プロファイルを示す。平均風に重畳して多くの風速振動が認められる。特に、対流圏界面のすぐ上部にあたる高度15-20km付近(図4で枠でかこった高度層)では、東西・南北風ともに、大きな振動が認められる。一定の高度における風速の時間変動について、周期を適宜調節してサイン関数を最小自乗近似する、ピリオドグラム解析により、高度15-20kmの風速振動の卓越周期が84時間であることが明らかになった。3つの観測点の間でほとんど位相差がないことから、空間スケールが大きな波動であろうと推測される。同様の長周期変動は11月および12月にも認められた。

Profiles of wind velocity variance and potential energy [(m/s)2, J/kg] for waves with vertical scales < 3.1 km in October

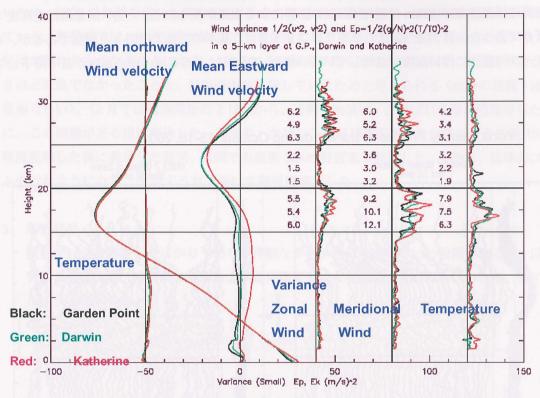

図5 10月の観測から得られた平均場と重力波エネルギーの高度プロファイル。 左から、南北風、温度、東西風、さらに高度スケールが 3.1km 以下の南北風・東西風擾乱 の分散、ならびに温度分散から推定した Potential Energy。

3. 3 短周期変動(大気重力波)

図4の左端の重ね描きプロファイルでは、線の広がり幅が変動成分の大きさに関係している。 高度 15-20km では上記の長周期変動により幅が大きく広がっている(なお、後述するように、 長周期成分を除いても変動分は大きい)。そして、高度 20-25km 付近で変動幅が一旦減少し、高度 25-30km で増大している。

この特性をより詳しく調べるために、個々の風速・温度プロファイルから背景場を差し引き、さらに高度方向にカットオフが 3.1km のハイパスフィルターを施して、小さな高度スケールの変動成分のみを抽出した。これの自乗値(分散)から求めた波動エネルギーを図5に示す。明らかに、高度 20-25km で重力波エネルギーが減少しており、しかも平均東西風と良く相関していることが分かる。この大気重力波が東西方向に伝搬しているならば、Critical level における相互作用、あるいは背景風によるドップラー効果の影響が考えられるが、ホドグラフを調べたところ、多くの波動が南北方向に伝播していた。 今後、さらに詳細なデータ解析を継続する必要がある。

DAWEX実験

2001年10-12月に Australia、Northern Territory の中心都市である Darwin 周辺で、巨大孤立型積乱雲(Hector)による大気波動励起に関する国際協同観測キャンペーンが行わ、多くの観測装置が投入された。

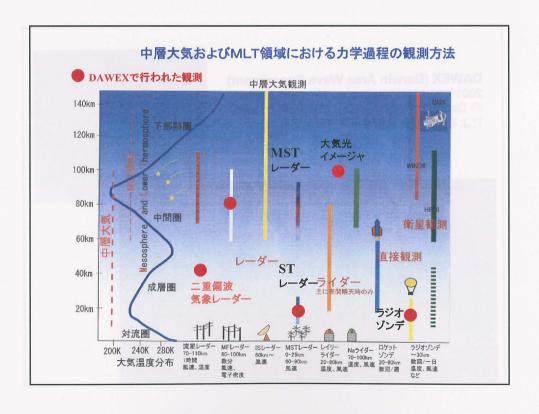

観測装置

対流圏: 50MHz Windprofiler(Darwin郊外)、915MHz BLR(同), 2重偏波ドップラーレーダー(同) 50MHZ BLR(Tiwi Island)

成層圏: 5日間のラジオゾンデキャンペーン 乾季(10月)に1回、Hector季(11-12月)に2回実施 Darwinではルーチン観測も継続されている。

中間圏: MFレーダー、CCDイメージャ各種

京大RASCは気球観測(ラジオゾンデ)を担当した。 協力機関: 豪州気象庁(BOM: Bureau of Meteorology) Adelaide 大学、Monash 大学

Darwin沖に Tiwi Islands と呼ばれる、狭い海峡をはさんだ二つの島 (Buthurst, Melville)があり、この上空に Hector が現れる。

気球観測サイト: 3点

Hectorからの波動伝播を調べるために、Tiwi Islandから南東方向に、 ほぼ直線的に並んだ3つの観測点を選んだ。

- (A) Tiwi Island上のPirlangimpi (Garden Point)
- (B) Darwin 空港のBOM測候所 (Hector から50-100km)
- (C) Katherine 空港 (Hector から約300km)

小型気球搭載ラジオゾンデ観測

モンスーンオンセット(10月末)以降12月頃まで、ほぼ規則的に Hectorが現れると期待される。

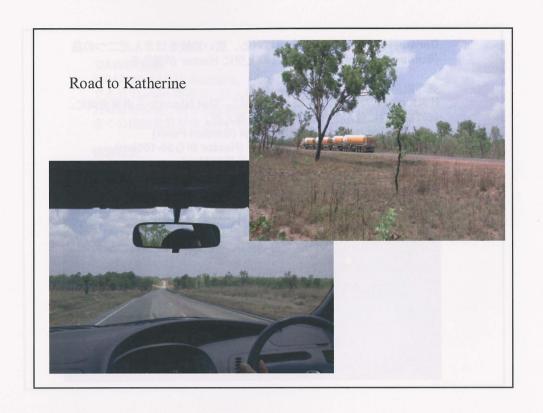

Hectorの有無による大気波動励起の相違を比較する。 Hector のない乾季(10月中旬)の観測結果を Hector季である11月後半と12月中旬の観測と比較する。

CCDイメージャ観測を考慮して、観測期間を新月前後に行う。

- (1)10月13-18日(新月: 10/17 20:59 LT at 135E)
- (2) 11月15-20日 (新月: 11/16 9:43 LT at 135E)
- (3) 12月11-16日 (新月: 12/15 22:27 LT at 135E)

5日間 (120時間) にわたり3 時間毎にラジオゾンデを放球し、 温度・風速を高度約30kmまで高精度測定する。 期間中の初日 (10/13) の14:45 時から 最終日 (10/18) の11:45 まで40回の放球を行う。

装置: レーダートラッキング (Darwin) GPSゾンデ (Garden Point and Katherine)

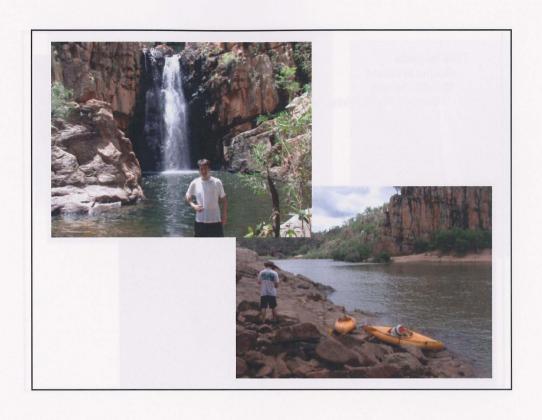

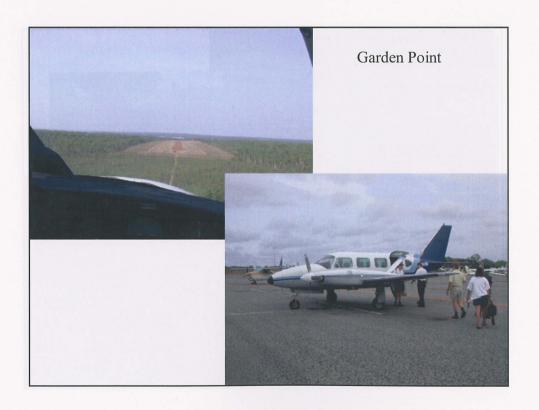

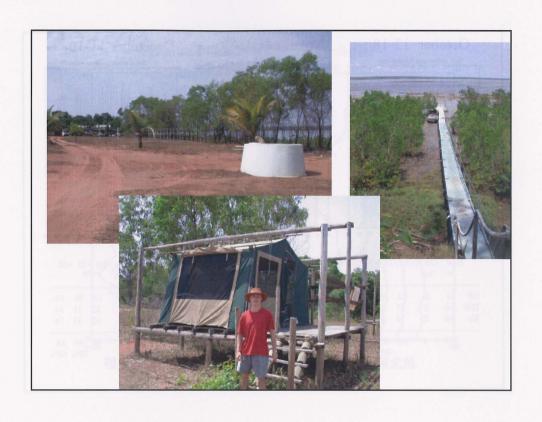

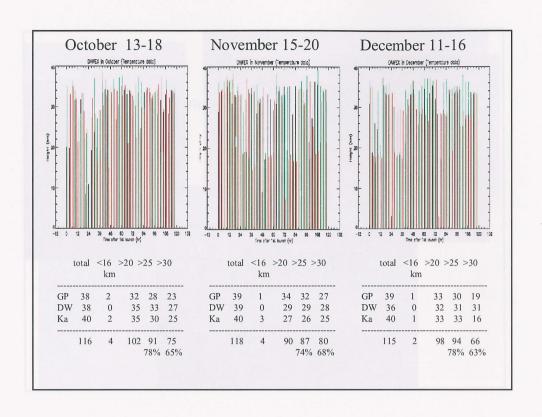

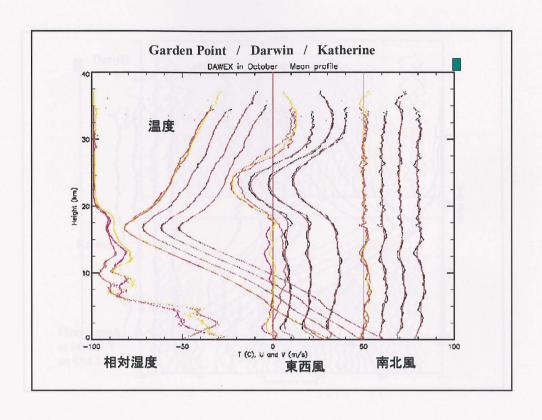

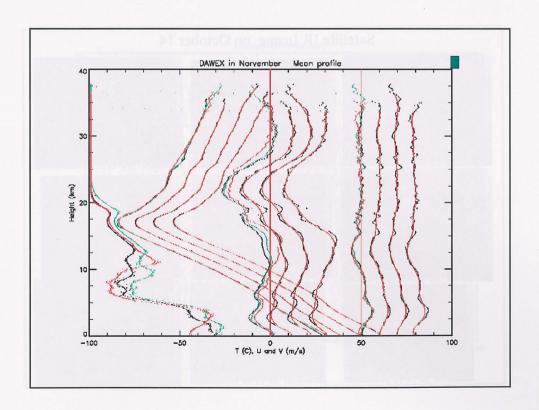

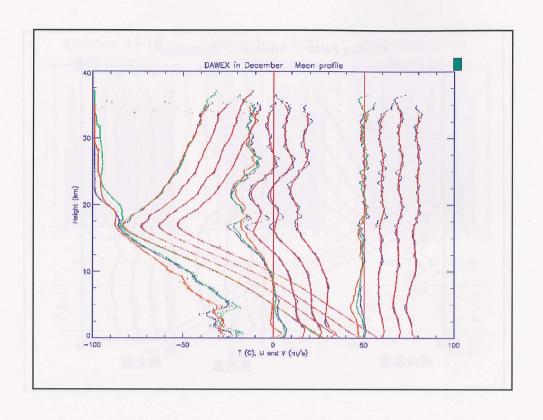

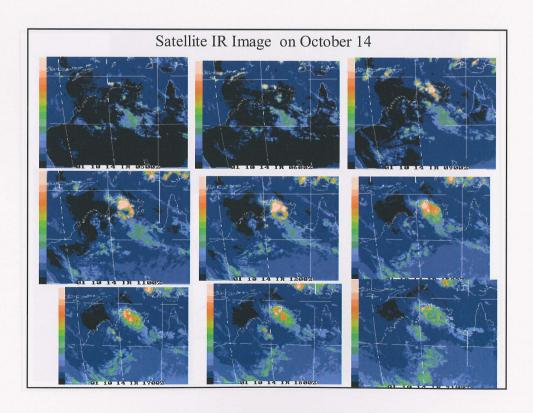

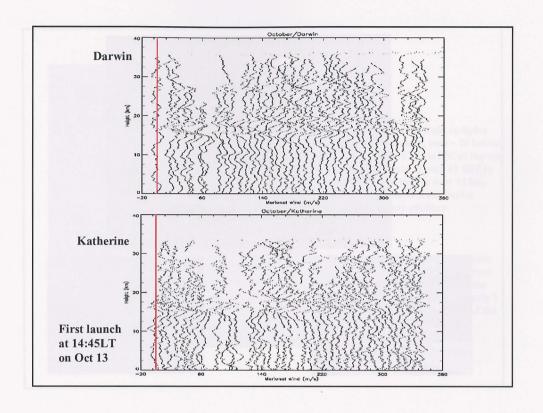

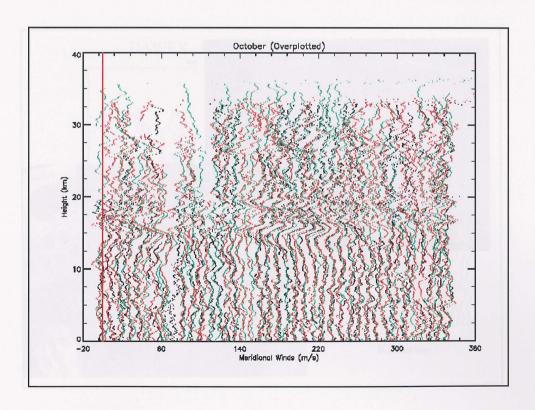

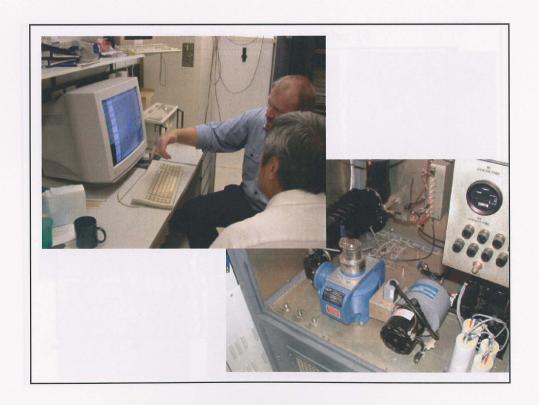

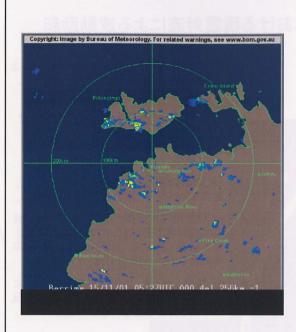

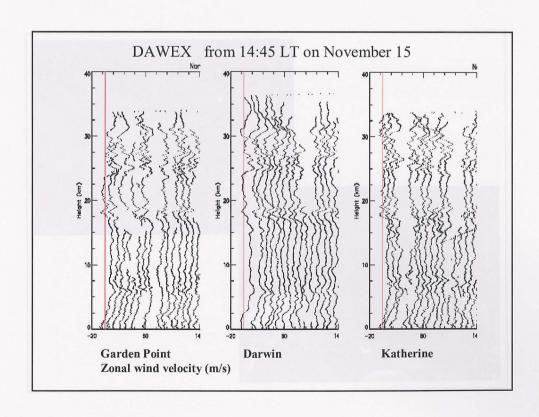

November 15

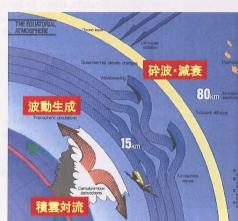

539 Tops to 20 km in main complex near Aplsley Straight, tops ~ 18 km on Cape Fourcroy Cells to SW of Darwin also developingnicely with 45 dBZ to over 10 km and tops to over 18 km. Gust front outflows from Hector visible a long way offshore.

559

Make that tops to 20 km over Tiwis. Also a spectacular anvil visible from Gunn Point as upper flow takes the anvil towards us and unfortuneately I don't have a camera, easily one of the best I have seen.

赤道域における積雲対流による波動励起

・赤道域では強い太陽放射エネルギーにより、対流圏で積雲対流が活発に励起されている。

・積雲対流により、さらに各種の大気波動が生成される。

(赤道波: ケルビン波、混合ロスビー波、 大気潮汐波、大気重力波)

大気波動が中層大気中を伝搬する際に、 力学エネルギー・運動量を上方輸送する。

・大気波動は背景風と相互作用し、赤道域では成層圏下部において東西風に準2年 周期振動(QBO)を、成層圏上部では半年 周期振動(SAO)を作り出している。

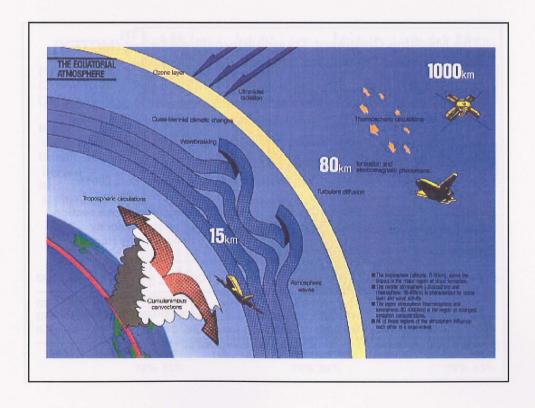

・中間圏に至ると、大気波動の振幅が増大 し、不安定現象を起こしやすくなり、背景風 へ与える影響も顕著になってくる。

Preliminary analysis

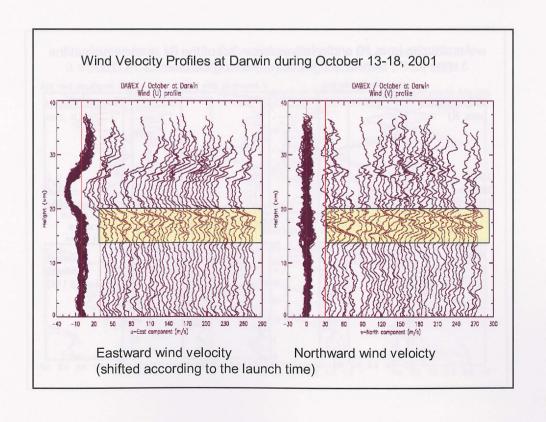

- Background conditions
- Long period oscillations near the tropopause
- Profiles of gravity wave energy in the stratosphere
- Latitude variation of wave energy in comparison to GPS occultation data obtained by CHAMP

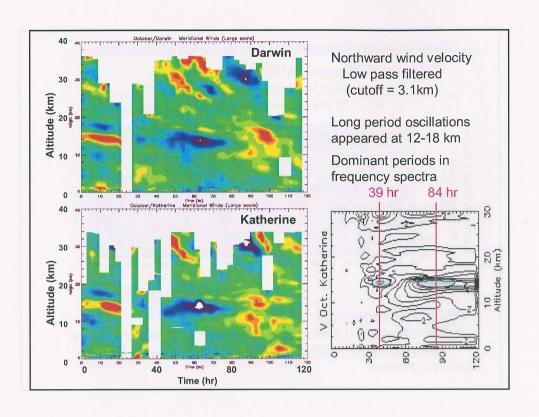

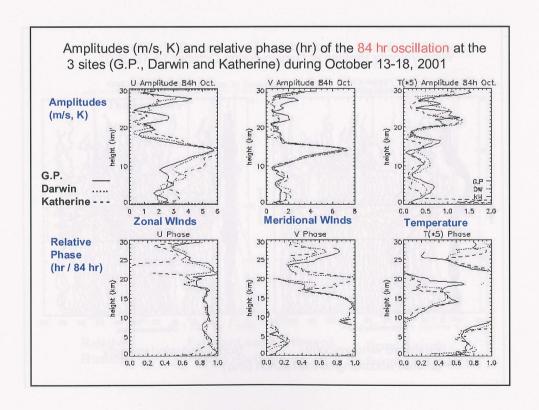

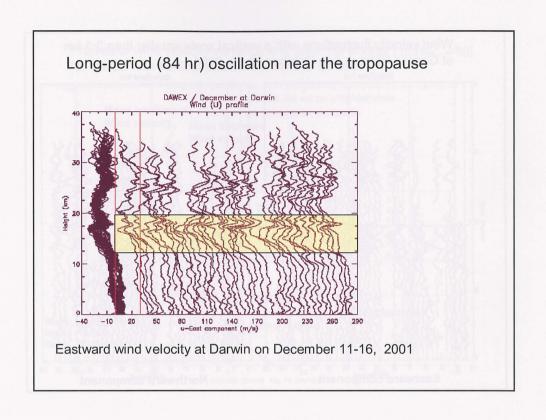

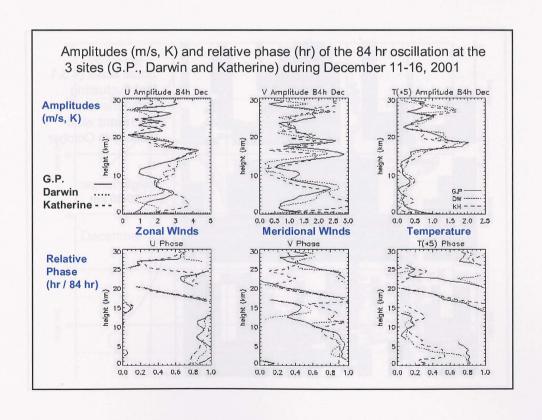

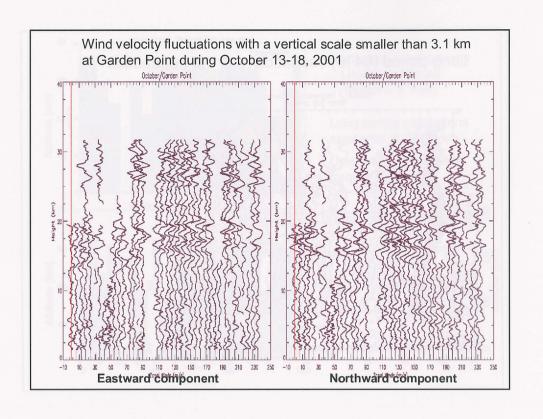

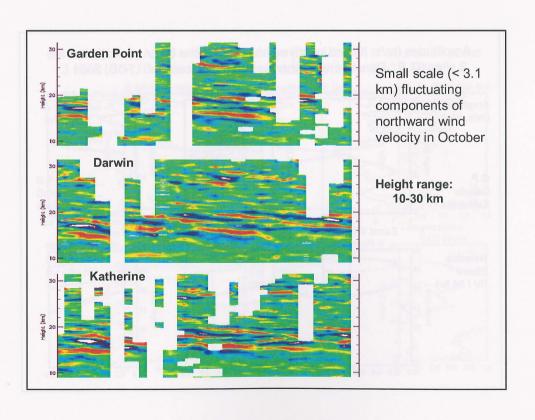

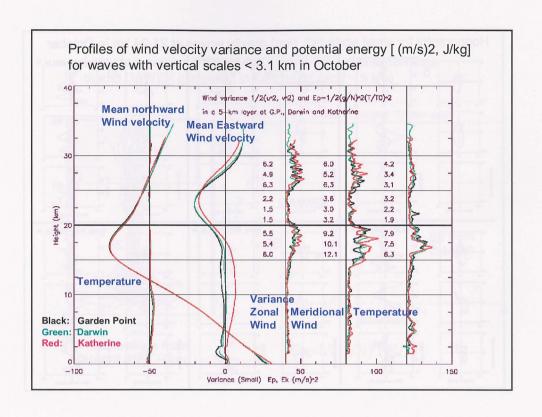

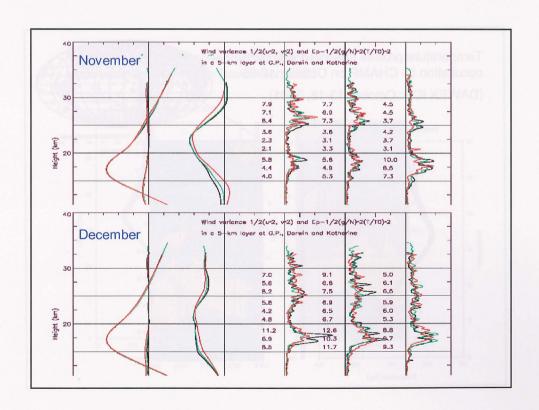

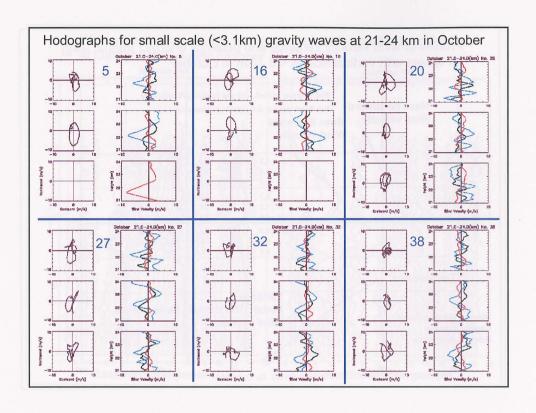

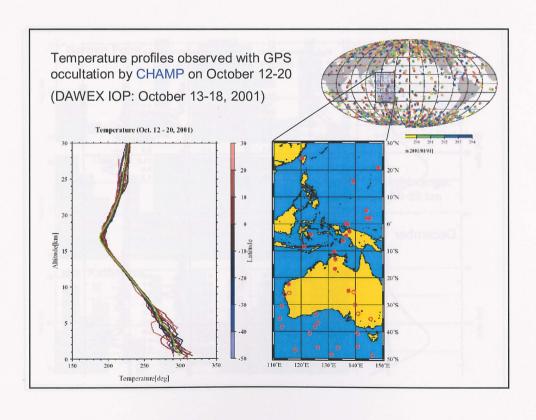

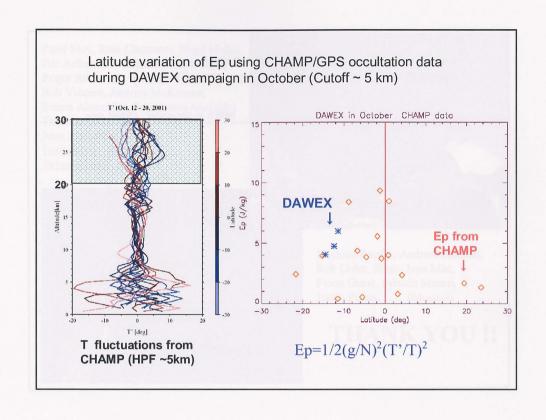

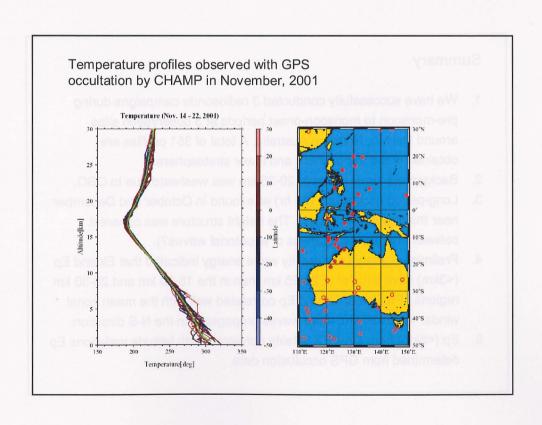

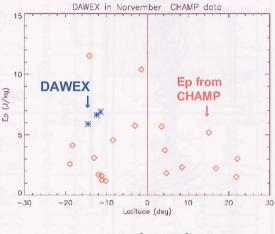

Latitude variation of Ep using CHAMP/GPS occultation data during DAWEX campaign in November (Cutoff ~ 5 km)

 $Ep=1/2(g/N)^2(T'/T)^2$

Summary

- We have successfully conducted 3 radiosonde campaigns during pre-monsoon to monsoon-onset periods at 3 observation sites around Darwin, Northern Australia. A total of 351 profiles are obtained in the troposphere and lower stratosphere.
- 2. Background zonal winds at 20-25 km was westward due to QBO.
- 3. Long-period oscillations (84 hr) was found in October and December near the tropopause region. The height structure was coherent between the 3 sites. (Effects of equatorial waves?).
- 4. Preliminary analysis of gravity wave energy indicated that Ek and Ep (<3km) were smaller at 20-25 km than in the 15-20 km and 25-30 km regions. Profiles of Ek and Ep correlated well with the mean zonal winds. At 20-25 km, more waves propagated in the N-S direction.</p>
- 5. Ep (<5km) from DAWEX is fairly consistent with latitude variations Ep determined from GPS occultation data.

1. INTRODUCTION

An intense convection known as Hector appears over the Tiwi islands (Buthurst, Melville Islands) in the Northern Territory, Australia during the build-up to the monsoon periods. Hector is normally associated with very strong thunderstorms, whose cloud-top sometimes reaches 20 km, penetrating into the lower stratosphere. The Maritime Continent Thunderstorm Experiment (MCTEX) was conducted from November 11 to December 8, 1995 in order to study characteristics of island-initiated meso-scale convective system [Keenan et al., , Bull., Am. Meteorol. Soc., 2433-, 2000]. By referring to radiosonde results during MCTEX, modeling of gravity wave generation by Hector was studied [e.g., Lane and Reeder, Q. J. R. Meteorol., 2705-, 2001].

As one of the international observation campaign of SPARC, DAWEX (Darwin Area Wave Experiment) was conducted in October-December, 2001 to observe characteristics of atmospheric gravity waves excited by Hector. A number of ground-based measurements were coordinated in DAWEX, such as radiosondes, dual-polarized C-band radars, VHF wind profilers, a medium frequency (MF) radar and CCD airglow imagers, aiming at describing wave phenomena in a wide height range covering the boundary layer, troposphere, middle atmosphere and lower thermosphere.

This paper is concerned with preliminary results from intensive radiosonde observations during DAWEX. Radiosonde campaigns with a duration of 120 hours were carried out 3 times on October 13-18, November 15-20 and December 11-16, 2001, which were selected just before a new moon so as to collaborate with CCD imager observations.

2. EXPERIMENTAL SET-UP

During IOP of DAWEX, we launched radiosondes every 3 hours from 3 sites. We obtained a total of about 360 profiles of temperature, humidity and wind velocity with a height resolution of 100 m. Almost all balloons (97%) reached the tropopause, and 78% and 63% ascended up to 25 and 30 km, respectively.

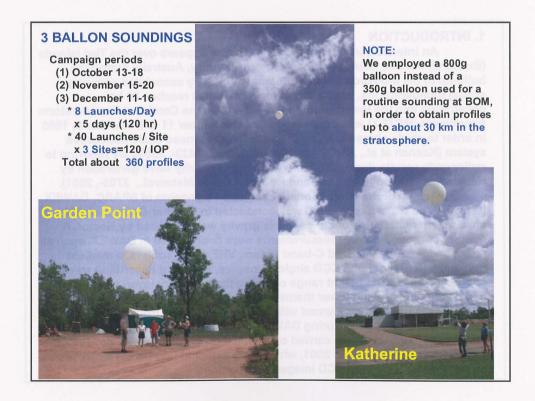

DAWEX Radiosonde Sites:

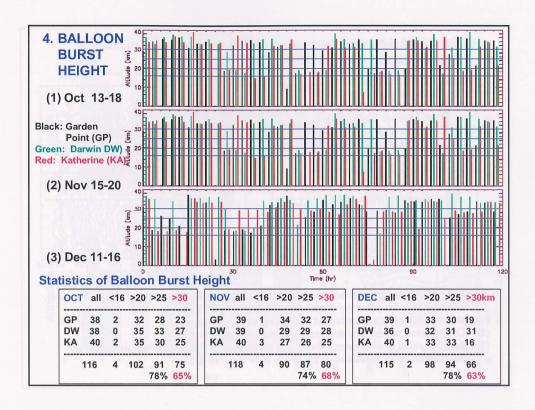

- (A) Pirlangimpi (Garden Point)
- (B) Darwin BOM weather station
- (C) Katherine civilian airport

Lat, Lon Distance Inertia period

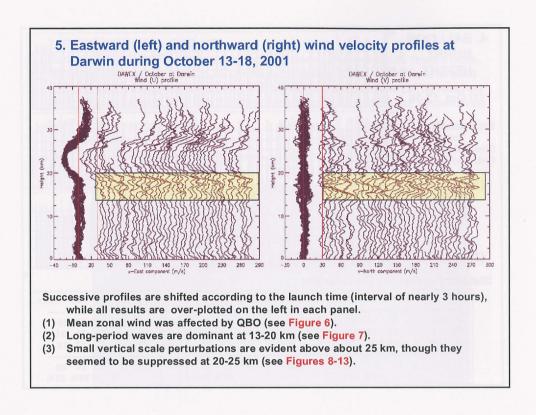

- 11.4S, 130.3E 0 61 hr
- 12.4S, 130.9E, 130 km 56 hr
- 14.5S, 132.5E, 400 km 48 hr

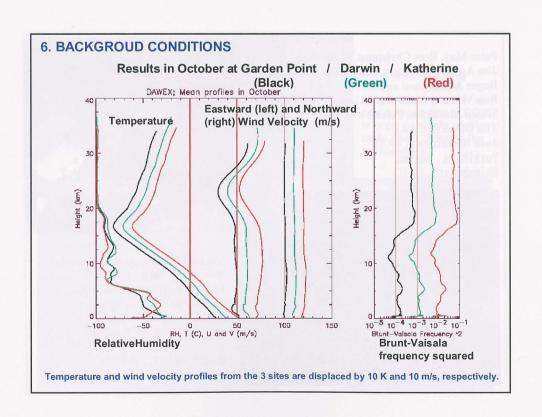

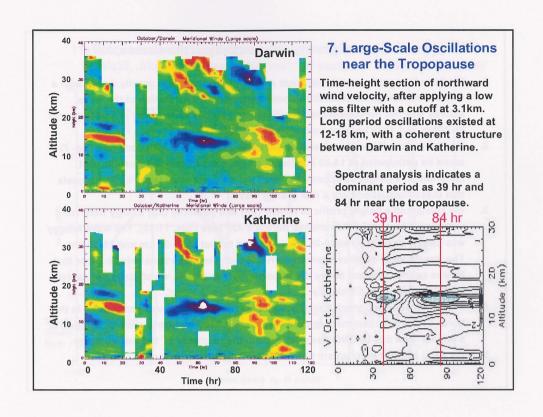

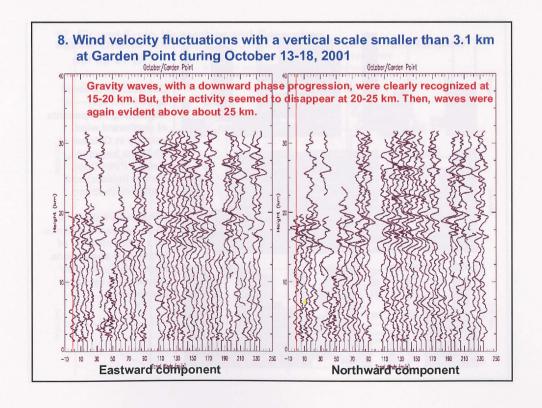

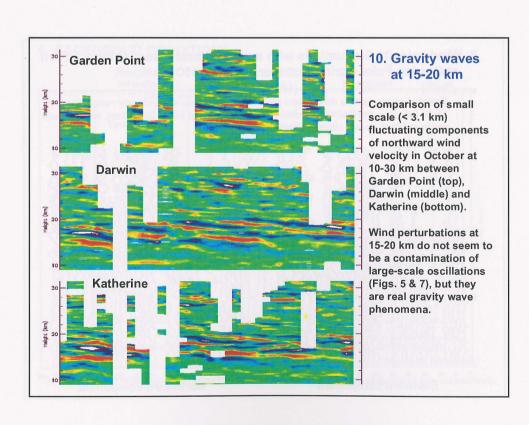

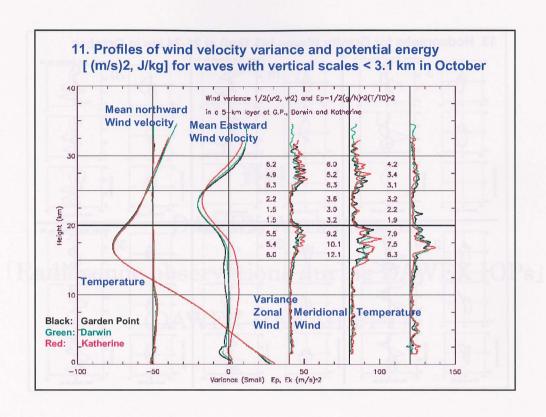

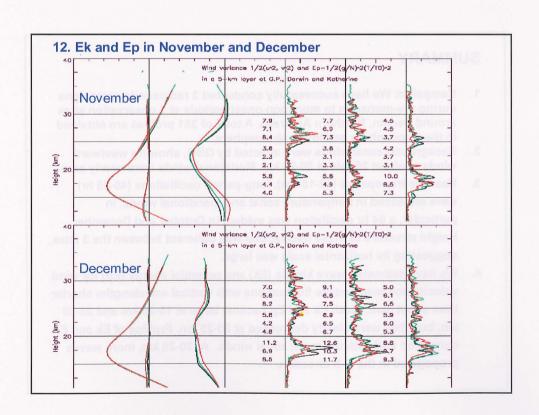

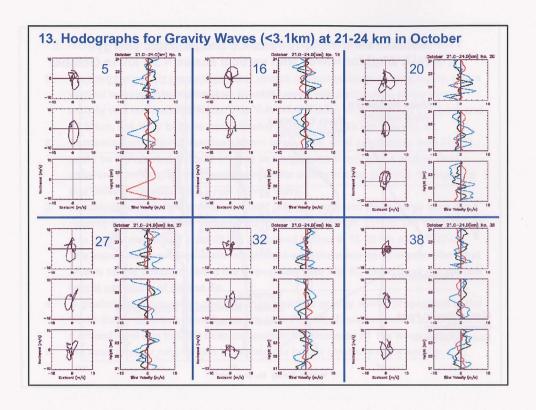

9. Height variations of gravity wave activity in the stratosphere

- We have frequently recognized clear events of stratospheric gravity waves with a vertical wavelength smaller than about 3 km. Height distribution of the wave activity was not homogeneous. The wave amplitudes were larger at 15-20 km and 25-30km, but, they became considerably smaller at 20-25 km (see Fig. 8).
- Contamination (filtered residuals) from large-scale wind oscillations (see Fig. 7) could be anticipated at 15-20 km due to a high-pass filtering of a profile. But, coherent time-height structures between the different sites (see Fig. 9) suggests that these fluctuations are a real gravity wave.
- 3. We calculated a height profile of kinetic (Ek) and potential (Ep) energy from wind velocity and temperature variance during 3 IOP (see Figs. 11-12). The wave energy was clearly depressed at 20-25 km compared to that at 15-20 km and 25-30 km. The wave energy profiles seem to correlate with the mean zonal winds. Note that N² was nearly constant above the tropopause (see Fig. 6), which does not explain height variations of Ek and Ep.
- A preliminary hodograph analysis indicates that gravity waves propagated in the North-South direction more frequently (see Fig. 13). Therefore, wave absorption at a critical level due to QBO does not explain the decrease of the wave activity.
- 5. We need another mechanism to explain the height structure of Ek and Ep.

SUMMARY

- Campaign: We have successfully conducted 3 radiosonde campaigns during pre-monsoon to monsoon-onset periods at 3 observation sites around Darwin, Northern Australia. A total of 351 profiles are obtained in the troposphere and lower stratosphere.
- 2. Background zonal winds were affected by QBO, showing westward winds of about 20 m/s at 20-25 km. Meridional winds were nearly zero.
- Near the tropopause (12-18 km), long-period oscillations (40-85 hr)
 were enhanced in temperature zonal and meridional winds. In
 particular, a 84 hr oscillation was evident in October and December.
 Height structure of these oscillations was coherent between the 3 sites,
 suggesting its horizontal scale was large.
- 4. We have estimated wave kinetic (Ek) and potential energy (Ep) for wind velocity and temperature fluctuations with vertical wavelengths shorter than about 3km. Both Ek and Ep became large at 15-20 km and 25-30 km, but, they were clearly depressed at 20-25 km. Profiles of Ek and Ep correlated well with the mean zonal winds. At 20-25 km, more waves propagated in the N-S direction.

Characteristics of island-initiated meso-scale convective system

Modeling of gravity wave generation by Hector

T. Lane and M. Reeder (Q. J. R. Meteorol., 2001; J. Atmos. Sci., 2001)

Meridional cross section of vertical velocity generated by Hector

 $\lambda x \sim 15-20 \text{ km}$ $\lambda z \sim 4-6 \text{ km}$ No preferential direction for horizontal propagation

Figure 4. (a) Zonal cross-section of vertical velocity through $y=100~\mathrm{km}$ for Domain 1. (b) Meridional cross-section of vertical velocity through $x=100~\mathrm{km}$ for Domain 1. Vertical velocity is contoured at 0.1 m s⁻¹ intervals, with the negative values dashed. Both plots are valid at 1300 LST. Note that (b) has a different horizontal scale

2. EXPERIMENTAL SET-UP

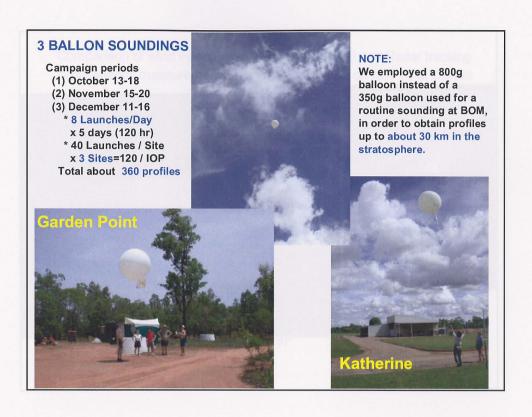

During IOP of DAWEX, we launched radiosondes every 3 hours from 3 sites. We obtained a total of about 360 profiles of temperature, humidity and wind velocity with a height resolution of 100 m. Almost all balloons (97%) reached the tropopause, and 78% and 63% ascended up to 25 and 30 km, respectively.

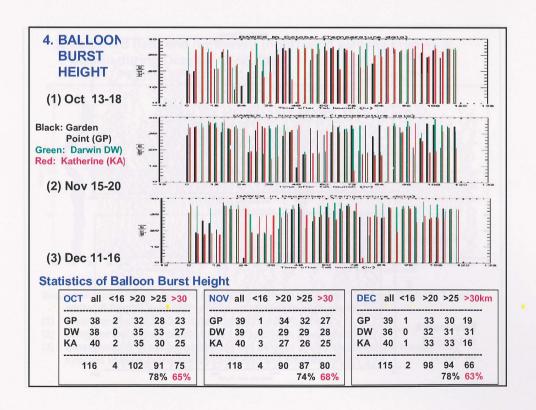

DAWEX Radiosonde Sites:

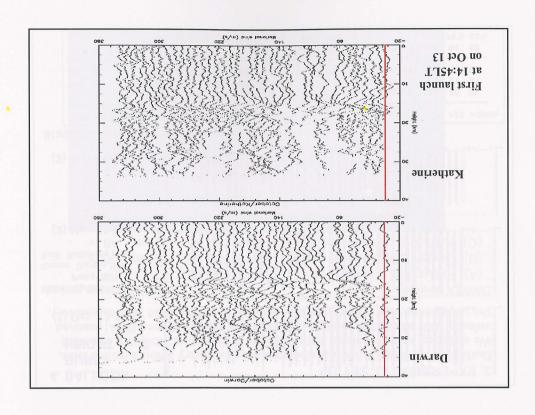

Distance Inertia period Lat, Lon

- (A) Pirlangimpi (Garden Point)
- 11.4S, 130.3E 61 hr 0
- (B) Darwin BOM weather station
- 12.4S, 130.9E, 130 km 56 hr
- (C) Katherine civilian airport
- 14.5S, 132.5E, 400 km 48 hr

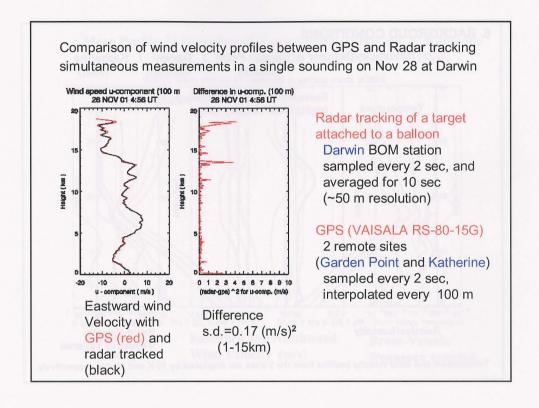

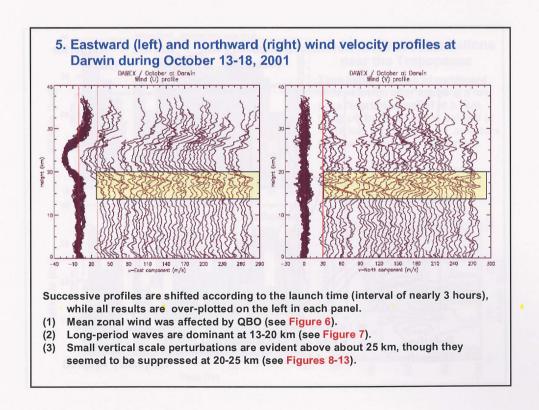

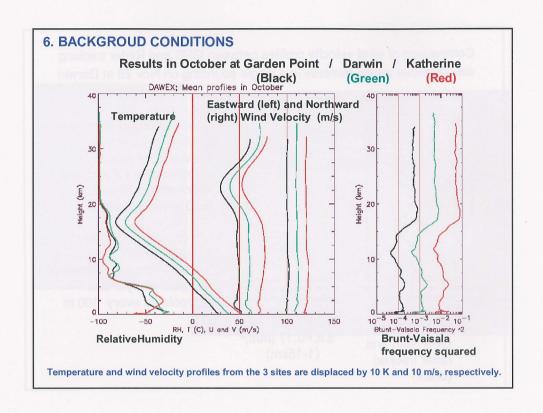

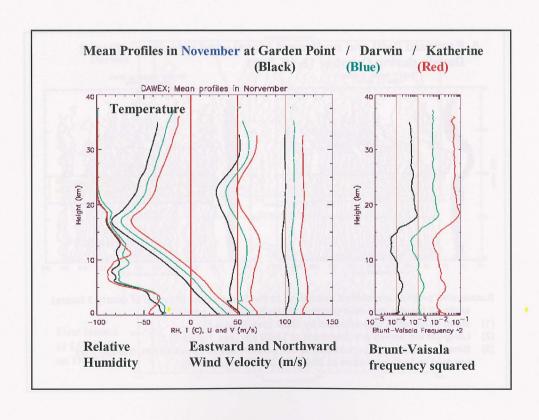

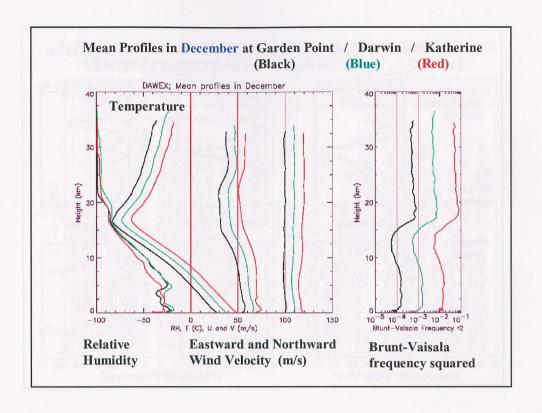

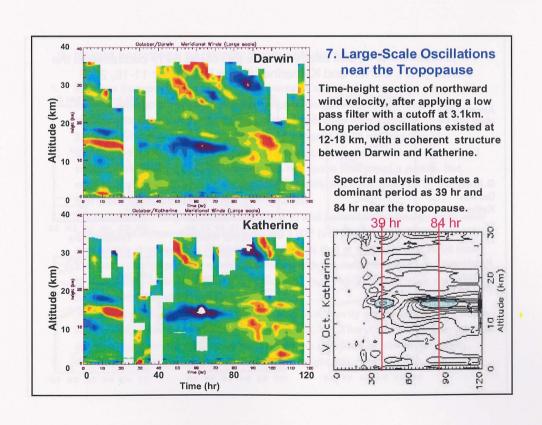

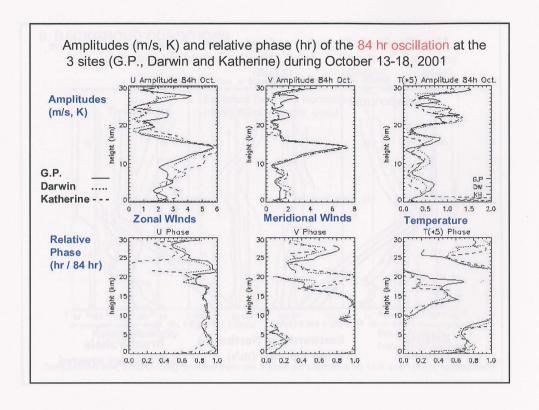

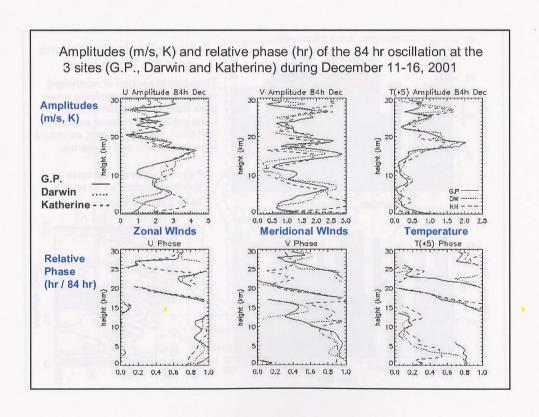

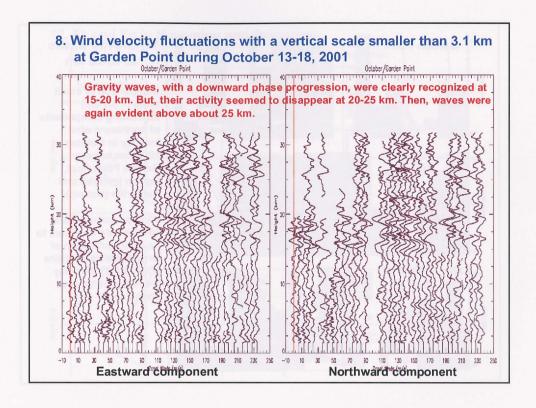

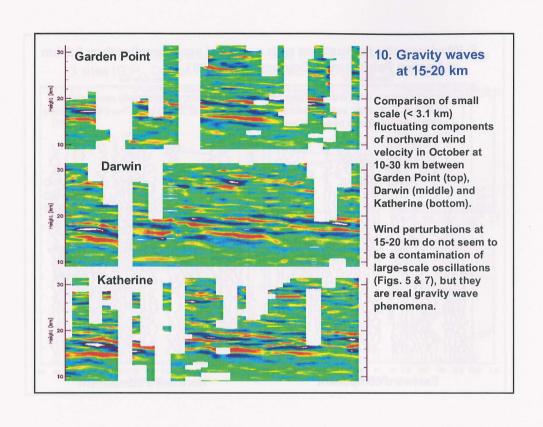

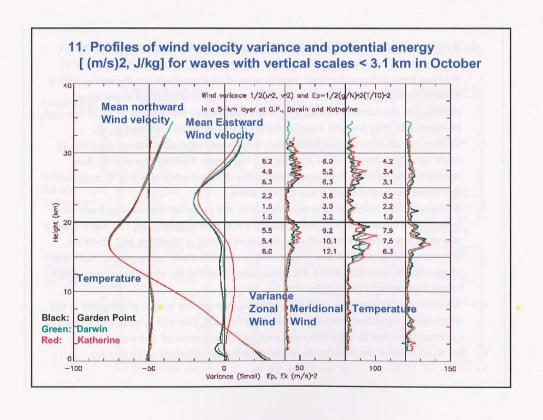

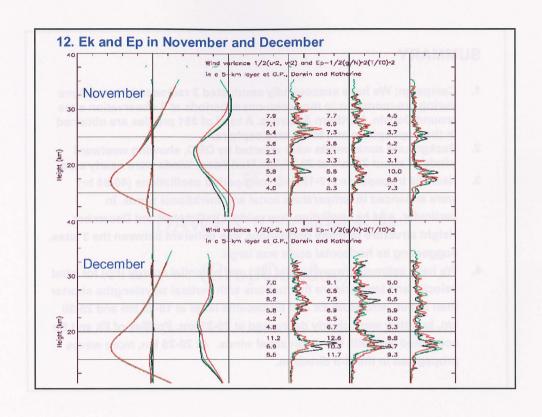

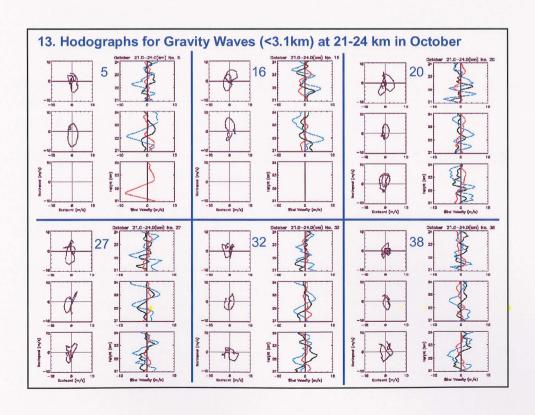

9. Height variations of gravity wave activity in the stratosphere

- We have frequently recognized clear events of stratospheric gravity waves with a vertical wavelength smaller than about 3 km. Height distribution of the wave activity was not homogeneous. The wave amplitudes were larger at 15-20 km and 25-30km, but, they became considerably smaller at 20-25 km (see Fig. 8).
- Contamination (filtered residuals) from large-scale wind oscillations (see Fig. 7) could be anticipated at 15-20 km due to a high-pass filtering of a profile. But, coherent time-height structures between the different sites (see Fig. 9) suggests that these fluctuations are a real gravity wave.
- 3. We calculated a height profile of kinetic (Ek) and potential (Ep) energy from wind velocity and temperature variance during 3 IOP (see Figs. 11-12). The wave energy was clearly depressed at 20-25 km compared to that at 15-20 km and 25-30 km. The wave energy profiles seem to correlate with the mean zonal winds. Note that N² was nearly constant above the tropopause (see Fig. 6), which does not explain height variations of Ek and Ep.
- 4. A preliminary hodograph analysis indicates that gravity waves propagated in the North-South direction more frequently (see Fig. 13). Therefore, wave absorption at a critical level due to QBO does not explain the decrease of the wave activity.
- 5. We need another mechanism to explain the height structure of Ek and Ep.

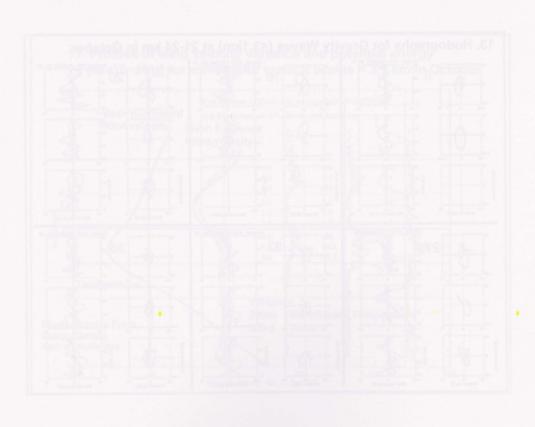

SUMMARY

- 1. Campaign: We have successfully conducted 3 radiosonde campaigns during pre-monsoon to monsoon-onset periods at 3 observation sites around Darwin, Northern Australia. A total of 351 profiles are obtained in the troposphere and lower stratosphere.
- 2. Background zonal winds were affected by QBO, showing westward winds of about 20 m/s at 20-25 km. Meridional winds were nearly zero.
- Near the tropopause (12-18 km), long-period oscillations (40-85 hr)
 were enhanced in temperature zonal and meridional winds. In
 particular, a 84 hr oscillation was evident in October and December.
 Height structure of these oscillations was coherent between the 3 sites,
 suggesting its horizontal scale was large.
- 4. We have estimated wave kinetic (Ek) and potential energy (Ep) for wind velocity and temperature fluctuations with vertical wavelengths shorter than about 3km. Both Ek and Ep became large at 15-20 km and 25-30 km, but, they were clearly depressed at 20-25 km. Profiles of Ek and Ep correlated well with the mean zonal winds. At 20-25 km, more waves propagated in the N-S direction.

Radiosonde Sounding for DAWEX experiment

August 15, 2001

Toshitaka Tsuda (RASC, Kyoto Univeristy) tsuda@kurasc.kyoto-u.ac.jp **Peter T. May** (BMRC, Bureau of Meteorology) p.may@bom.gov.au

Hector over Darwin (Taken from BOM home page)

1. Chief participants

Toshitaka Tsuda (Kyoyo University)
Peter May (BMRC, BOM)
Mike Reeder (Monash University)
Robert A. Vincent, Andrew McKinnon (Adelaide University)

2. Observation periods: **Three core periods** with a duration of **5 days**. One IOP in a **dry season (middle of October)** and two during **a Hector period (end of November and middle of December)**.

See Appendix 1 by Kevin Hamilton

IOP should be selected considering statistics and MLTCX results. See Appendix 3 by Joan Alexander

3. Launch sites: **3 sites** are proposed, provided budget, man/womam-power and receivers are available.

See Appendix 2 from Kevin

site A: Darwin weather station of BOM (50-100 km from Hector)

site B: Civillian airport in Katherine (about 300 km from Hector)

site C: **Tiwi island** (0 km from Hector) See Appendix 8 from Bob Vincent

4. Observation periods

(1) October 13-18 (New moon at 20:59 LT on Oct 17 at 135E)

(2) **November 15-20** (New moon at 9:43 LT on 11/16 at 135E)

(3) **December 11-16** (New moon at 22:27 LT on 12/15 at 135E)

Observation periods are selected just before a new moon, except (2), so as to coordinate with CCD imager observations. We will start launching at 15LT on the first day, and finishes at 12 LT on the last day. Two and one extra days should be reserved for set-up and clearing, respectively. Therefore, the entire period will be (1) October 11-19, (2) November 13-21, and (3) December 9-17, respectively.

- 5. Daily launch schedule (tentative)
 - Routine soundings at Darwin (site A only)
 - (a) 350 gram balloons with **sondes and radar targets** at **8.45am CST** (2315 Z) and **8.45pm CST** (1115 Z)
 - (b) 100 gram balloons with radar targets (no sonde) at 2.00pm CST (0430 Z) and 2.00am CST (1630 Z).
 - Campaign: 3 hourly, i.e. 8 launches per day, for 5 days from the 3 sites See Appendix 1 from Kevin

Note: 800 gr balloon will be used at site A (see item 5).

Question by Joan about periods, sites and receivers (see Appendix 7)

- 6. Radiosondes and Receivers
 - site A: VAISALA RS80-15(PTU only) + radar reflector

Number: $40 \times 2 \text{ IOP} = 80$

PTU and radar tracked winds

See Appendix 3 from Joan, and response by Peter in Appendix 4

site B, C: VAISALA RS80-15G (PTU+GPS wind)

Number: 40 x 2 sites x 2 IOP = 160

PTU and GPS winds by Digicora (MARWIN)

Monash: See Appendx 5 from David Karoly

Bureau: See Appendix 6 from Peter May

For estimates of the costs, see Appendix 10.

- 7. Balloon and gas
 - 800 g (TOTEX TX-800) balloon is preferable for a sounding up to 30km.

800g balloon at sute A for a regular sonde

Hydrogen is generated at site A.

800g balloon at sutes B and C for a GPS sonde

Helium gas must be used at remote sites.

- 8. Operator
 - site A: **BOM staff**. Overtime wage is necessary.

See Appendix 11 for labor.

site B, C: 2 persons/team x 2-3 teams at each site

8-10 students from Monash and Adelaide

need a training

travel expenses and per diem for 8-9 days.

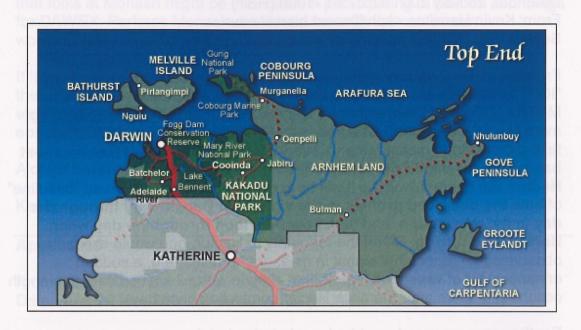

Airfare: ~\$1000 to Darwin, + to Katherine/Pirlangimpi

See Appendix 9 from David

- 9. Visit by scientists
 - (1) October: T. Tsuda and 1-2 students from Kyoto
 - (2) November: Joan Alexander and friends from NCAR
 - (3) December: T. Tsuda and 1-2 students from Kyoto

10. Logistics:

Need a survey for Katherine and Tiwi island.

Appendix 1

Date: Sat, 26 May 2001 17:07:01 -1000 (HST) From: Kevin Hamilton <kph@soest.hawaii.edu> Subject: Re: DAWEX meeting at Innsbruck

From the point-of-view of gravity wave generation, I would encourage the "IOP" for DAWEX to start before the Hector "season" begins. So while the MCTEX IOP was 13 November-10 December, I would advocate something more like 15 October-15 December for DAWEX, even if that means not taking radiosonde measurements every day. My reasoning is that the most basic goal for DAWEX is to clearly observe the waves generated by Hector. For the radiosondes it will be good to have a well-observed "baseline" of how the observed profiles in the vicinity of Darwin vary through the day in the dry season, and then how they look throughthe day when Hector is occurring. Given the regularity of Hector, one would expect to observe some repeatable signal in measured profiles (e.g. a sudden enhancement of variations near 22 km altitude with ~2 km vertical wavelength occurring 3 hours after the peak Hector convection each day).

For the same reasons I would advocate trying to take measurements as frequently as possible during each 24 hour period, even if that means covering fewer days in total. I guess the other factor may be a tradeoff between how frequently the balloons are launched and how high each one can be tracked (before switching the receiver to the next balloon). So I would advocate 3-hourly (or even more frequent) if this gives reasonable height coverage in the lower stratosphere.

Anyways these are just my ideas. There may be other scientific considerations that I have not thought about and also practical limitations that I am not aware of. You should be able to discuss this in person with Bob and Joan next month at CEDAR and then with Bob and myself at IAMAS.

Aloha.

Kevin

Appendix 2

Date: Mon, 28 May 2001 10:53:24 -1000 (HST) From: Kevin Hamilton < kph@soest.hawaii.edu>

I think some very interesting results could be obtained with ~150 soundings. Again from a DAWEX-science point-of-view I think it would be best to deploy them with the goal of characterizing the diurnal cycle of wave activity as completely as possible on selected days spaced over the mid-October to mid-December time frame. If at all possible, it would be great to get observations from more than one location within ~200 km of Hector on at least some days. Peter and Bob can let you know how practical that might be.

I have copied this message to David Karoly who had at one point indicated that folks at Monash might be interested in participating in balloon soundings for DAWEX. Perhaps Monash could help out with the manpower/ womanpower issue for your sondes.

If it turns out not to be practical to space out the sondes over two months, then I would advocate picking a more compressed period near the expected onset of the Hector season to have the best chance to sample some dry days and some well-developed Hector days.

Aloha.

Kevin

Appendix 3

From: Joan Alexander <alexand@colorado-research.com>

Date: Tue, 29 May 2001 09:16:40 -0600 (MDT)

I just wanted to bring up the importance of also having very regular twice-daily soundings at high z resolution during this campaign. The reason is that we already know the primary signal in radiosonde observations like these is associated with short vertical wavelength low-frequency inertia-gravity waves. Characterizing these will be crucial to interpreting the shorter-term IOP data. If we can characterize the low frequency waves from other routine soundings in the area, perhaps that will do. If not, I think it would be a mistake to eliminate the regular low-frequency sampling in favor of only sporadic IOPs. Some compromise may be needed.

Joan

Appendix 4

Date: Fri, 01 Jun 2001 13:42:43 +1000 From: Peter May <p.may@bom.gov.au>

the Bureau archives the 10 s sounding data routinely. The winds at **Darwin are radar tracked**, but at high temporal resolution so we have a vertical res of a few 10's of m there as well.

The other soundings would be GPS sondes and the raw data could be stored,

peter

Ross.

as we discussed, we are interested in using the GPS capable digicora for 2 periods of about 5 days in Darwin. (actually either on the Tiwi's or down at Katherine). The dates are yet to be confirmed, but we are looking at mid August and late November.

Peter

Appendix 6

Date: Wed, 30 May 2001 11:20:30 +1000

From: David Karoly <David.Karoly@sci.monash.edu.au>

Hi,

Thanks for copying your messages to me. We have some students that are likely to be interested in participating in this field program. I am not sure how many we could provide but I think that it will be 2-4 students. We are interested in being involved in the experiment. However, we do not have funding to support the travel and per diem expenses of the students involved. Hence, we would need funds from somewhere if our students are to participate.

In addition, we have a portable GPS Marwinsonde system that could be made available for the sonde launches during the experiment. We would need to know whether this is likely to be needed or not, so that it can be reserved.

Best wishes, David

Appendix 7

From: Joan Alexander <alexand@colorado-research.com>

Date: Fri, 1 Jun 2001 08:20:39 -0600 (MDT)

.

Can you forsee any **problems mixing the radar tracked with the GPS sonde data?** It sounds like there should be "no worries".

.

The plan looks good to me. What latitude is Katherine? I am thinking about the possibility that the seasonal change in the winds at Katherine from Oct to late Nov might be substantial enough to have a first-order effect on the waves in the stratosphere over and above the changes in the convection.

The only other possible issue is that the plan gives us **only one shot at each dry and Hector situation**. Do you have confidence in your selected October

and November periods regarding storm statistics, or do we need more research there before setting dates?

Joan

Appendix 8

Appendix 9

Date: Tue, 12 Jun 2001 16:07:42 +1000

From: David Karoly <David.Karoly@sci.monash.edu.au>

Hi Peter,

Our Marwin system is the same as the Bureau's, with GPS wind finding. It is portable (reasonably) but we don't have many (any??) trained students at this time.

I was going to reply to Tsuda today about costs and other arrangements for Darwex. I think that it would be best to get information about the likely costs and arrangements for using the Marwinsonde and **Monash grad students from Michael Reeder**, as he has more recent experience than me with field work in Northern Australia and I am buried under a heap of admin work.

It is likely that Monash could provide a few graduate students to help run Marwin soundings for Darwex and that the Monash Marwinsonde system could be used but we would need funds to support the students and to transport the equipment and students to Darwin. I don't know how much that would cost. Michael may have some information on air fare and other costs.

Sorry that I can't help more, David

Peter May wrote:

>

Appendix 10

Date: Tue, 12 Jun 2001 14:17:41 +1000 From: Peter May <p.may@bom.gov.au>

Cc: r.canterford@bom.gov.au

The required funds for the sondes etc are given below.

Total for 160 RS80GPS and 80 RS80 standard is \$AUD 45,000.00

We have also obtained some **freight quotes**, and included the **MARWIN**: To Darwin (sondes and MARWIN): \$AUD 3,218.00 and from Darwin MARWIN): \$AUD 930.00

This price is the total cost for sondes, balloons etc. We are providing in-kind support to the project through the partial supplementation from our operations, in order to reduce costs overall as far as possible.

Do you want me to chase up the cost of He for the remote sites? There will also be some shipping to get equipment, gas, sondes etc from Darwin onto the Tiwis and down to Katherine.

regards,

Peter

Appendix 11

Cost for extra radiosondes from Darwin airport (BOM)

e-mail from: Jim Arthur J.Arthur@Bom.Gov.Au cc: p.dutton@bom./gov.au, b.kittler@Bom.Gov.Au

: Cathai<mark>n ga staic</mark> - nachaigealean ach: - Gàtha an maric

Current Programme

Currently, we release (a) 350 gram balloons with sondes and radar targets at 8.45am CST (2315 Z) and 8.45pm CST (1115 Z) (b) 100 gram balloons with radar targets (no sonde) at 2.00pm CST (0430 Z) and 2.00am CST (1630 Z).

Additional Programme (Scenario 1)

If DAWEX only wants (a) a sonde hung off the 2.00am and 2pm flights, upgraded to 350gm balloons (b) an additional 350 gm flight (sonde only, no radar tracking) approximately ½ way between each of these four programmed flights (so, flight times are about 2315Z, 0200Z, 0430Z, 0800Z, 1115Z, 1400Z, 1630Z, 2000Z) rather than exactly every three hours as requested, then the additional labour costs would be as follows:

For each day Monday to Thursday

Total labour cost would be: \$708.40

For each Friday/Saturday

Total labour cost would be: \$790.90

For each Sunday

Total labour cost would be: \$880.10

Additional Programme (Scenario 2)

If you want the sondes at exactly 3 hour intervals, (as would be required if using 800gm balloons) but without wind observations on the additional flights, then an additional 2 hours of rostered time would be required each day bringing the labour costs to:

For each day Monday to Thursday: \$ 911.90 For each Friday and Saturday: \$1010.90 For each Sunday: \$1100.00

Additional Programme (Scenario 3)

Sondes at exactly 3 hourly intervals (using 800gm balloons) with wind observations on all additional flights.

For each day Monday to Thursday: \$1,107.70
For each Friday and Saturday: \$1,450.90
For each Sunday \$1,540.10

Consumable costs/day

(a) For 350gm balloons programme with wind observations

6 X \$13.38 = \$80.28 for balloons 4 X \$ 3.99 = \$15.96 for targets 6 X \$98.38 = \$590.28 for radiosondes 3 X \$ 1.24 = \$ 3.72 for torch/batteries

Total addition consumable costs for programme using 350gm balloons =

\$690.24 per day

(b) For 800gm Balloons programme with wind observations 8 X \$39.40 = \$315.20 for balloons other costs as per 350gm programme

Total additional consumable costs for programme using 800gm balloons = \$925.16 per day

資料 7 キャンペーンの企画書(10 月) (Oct13.doc)

Radiosonde Sounding for DAWEX experiment

October Campaign

1. Observation periods: October 13-18

The observation period is selected just before a new moon (new moon at 20:59 LT on Oct 17 at 135E) so as to coordinate with CCD imager observations. We will start launching at 14:45 LT (5:15 Z) on the first day (October 13), and finish the last launch at 11:45 LT (2:15 Z) on the last day (October 18).

- 2. Launch sites: 3 sites
 - site A: Darwin weather station of BOM (50-100 km from Hector)
 - site B: Civillian airport in Katherine (about 300 km from Hector)
 - site C: Tiwi island (0 km from Hector)

Open field near a fishing lodge at Garden Point

- 3. Schedule
 - October 10 Initial inspection and briefing at BOM workshop (Ross Christmas and Phil Dutton)
 - October 11 Training of a radiosonde launch at the wind profiler site
 - October 12 Move to the remote launch sites

To Katherine: vehicle by Ross Christmas and a rent-a-car

To Garden Point; a charter flight or RPT

Set-up radiosonde equipment

October 13 System check at Katherine by Ross Christmas,

at GP by Neil Mules

First launch at 14:45 CST (5:15 Z)

October 14-17 Continue 8 launches/day every 3 hours (see Launch Schedule)

October 18 Last launch at 11:45 LT (2:15 Z)

Clean-up the sites, and return to Darwin

- 4. Equipment
 - (1) Receiver: VAISALA digiCola (Marwin) from Monash and BOM
 - (2) Radiosonde: RS80-15G (PTU + GPS winds) x 40 at GP and Katherine
 - (3) Balloon: TX-800 (800 gram) x 40 at each site
 - (4) Helium gas and regulator

- (5) Ground-check: VAISLA kit and a barometer
- (6) tents (wind shelter)

5. Launch schedule

Considering a routine launch schedule (* in the table) at the Darwin meteorological station, we will launch 8 balloons/day every 3 hours at 2:45 LT, 5:45 LT, 8:45 LT, 11:45 LT, 14:45 LT, 17:45 LT, 20:45 LT and 23:45 LT.

			Oct					
LT	UT	Date	13	14	15	16	17	18
2:45	17:15			5	13	21	29	37

DAWEX (Darwin Wave Experiment)

Radiosonde Sounding in November

40th launch at 11:45 on October 18, 2001, at Garden Point, by Justin, Fiona, Simon, Stewart and Andrew

1. General Information

Please visit the following Home Pages.

- (A) DAWEX http://www.aig.asn.au/gravity waves.htm
- (B) SPARC (Stratospheric processes and their role in climate)

http://www.aero.jussieu.fr/~sparc/

Click SPARC initiatives, and look for Gravity waves

- (C) Photos from October campaign (by Takayuki Yoshihara)

 http://www.kurasc.kyoto-u.ac.jp/radar-group/members/dawex/index.html
- (D) Photos from October campaign (by Robert Goler)
 http://www.maths.monash.edu.au/~robert/Weather/Dawex/Day1/today.html

2. Observation periods: November 15-20, 2001

The observation period is selected around a new moon (9:43 LT on November 16 at Darwin) so as to coordinate with CCD imager observations. We will start launching at 14:45 LT (5:15 Z) on the first day (November 15), and finish the last launch at 11:45 LT (2:15 Z) on the last day (November 20).

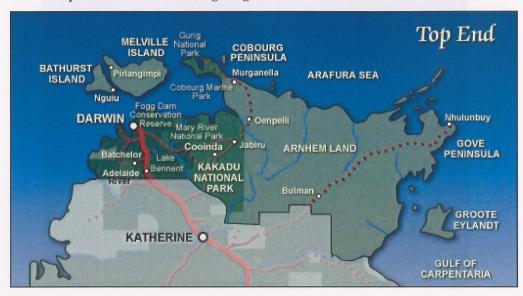

3. Launch sites

site A: BOM weather station at Darwin airport (about 50 km from Hector)

site B: Civillian airport in Katherine (about 300 km from Hector)

site C: Garden Point (Pirlangimpi) on Tiwi islands (0 km from Hector)

Open field near a fishing lodge

4. Schedule

November 12

To arrive Darwin from Melbourne/Adelaide

Briefing at BOM by Ross Christmas and Nigel Mules

November 13

Training of a radiosonde sounding the BoM Darwin Airport Radar office

Balloon (see Home page (C))

MARWIN and PC

Construction of a tent (see Home page (C))

November 14 Move to the remote launch sites

To Katherine: vehicle by Ross Christmas and a rent-a-car

To Garden Point; a flight by Wimray leaving at 8:00 AM

Set-up radiosonde equipment

NOTE: Joan Alexander will arrive Darwin at 10:40 by QF673 from Adelaide, and will take a Wimray flight leaving at 16:00 for GP.

November 15 **System check** at Katherine and GP by Ross Christmas and Nigel Mules, respectively.

First launch at 14:45 CST (5:15 Z)

November 16-19 Continue 8 launches/day every 3 hours (see Launch Schedule) November 20 Last launch at 11:45 LT (2:15 Z)

Clean-up the sites, and return to Darwin

From Garden Point; a flight leaving at 5:00 PM

NOTE: Please check the followings before leaving the sites.

- 1. Number of radiosondes, balloons and parachutes
- 2. Number of Helium gas bottles

Summary Meeting at Tim's on the bay from 7:30 PM

5. Equipment

- (1) Receiver: VAISALA digiCola (Marwin) from Monash and BOM
- (2) Radiosonde: RS80-15G (PTU + GPS winds) \times 40 at GP and Katherine RS80 (PTU) with a radar winds \times 40 at Darwin
- (3) Balloon: TX-800 (800 gram) x 40 at each site
- (4) Helium gas at remote sites
- (5) Parachutes (Radar reflector was used in October.)
- (6) Ground-check: VAISLA kit and a barometer
- (7) tents (wind shelter)
- (8) Mobile Phones: 2 mobile phones are available at Katherine. One should be kept at the launch site. (408)-578-287 (409)-383-485

6. Launch schedule

Considering a routine launch schedule (* in the table) at the Darwin meteorological station, we will launch 8 balloons/day every 3 hours at 2:45 LT, 5:45 LT, 8:45 LT, 11:45 LT, 14:45 LT, 17:45 LT, 20:45 LT and 23:45 LT.

·								***************************************
LT	UT	Date	15	16	17	18	19	20
2:45	17:15			5	13	21	29	37
5:45	20:15			6	14	22	30	38
8:45	23:15	*		7	15	23	31	39
11:45	2:15			8	16	24	32	40
14:45	5:15		1	9	17	25	33	
17:45	8:15		2	10	18	26	34	
20:45	11:15	*	3	11	19	27	35	
23:45	14:15		4	12	20	28	36	

We assume that 6 persons at each site will be separated into 3 sub-groups, then, each

group will work on 2-4 successive soundings. Rotating of a shift should be discussed.

Note: Call Tidal airport (8973 6740) before launching a balloon between 9AM and 6 PM.

7. Frequency allocation

Frequency range permitted: 400.15 - 403.00 MHz

	1st preference	2nd preference	
Darwin	401.0 MHz	400.5MHz	
Katherine	$402.0 \ \mathrm{MHz}$	$401.5\mathrm{MHz}$	
Garden Pt	$403.0 \ \mathrm{MHz}$	$402.5~\mathrm{MHz}$	

VAISALA radiosonde is tuned at 403 MHz.

^(*) Joan will leave Darwin by QF829 at 00:15 on November 21.

(B) Transportation

Rent-a-car (Delta): Minibus (7 seats) Reservation # DWBJJ4

(Note that we are on a waiting list for Toyota Tarago with 8 seats.)

Pick up at Darwin airport at 12:00 on Nov 12, and drop at 12:00 on Nov 21.

Booking is guaranteed by Tsuda's VISA card.

NOTE: Take a taxi to downtown Darwin, if necessary, and keep a receipt for reimbursement. Contact Ross for details.

Wimray flights between Darwin and Garden Point.

Booking is made by Ross with Tsuda's VISA card.

Nov 14: Lv. Darwin at 8:00 (6 persons, including Nigel)

Nov 14: Lv. Darwin at 16:00 (Joan Alexander)

Nov 20: Lv. GP at 17:00 (6 persons)

(C) Support and reward

- (1) Room charge for a hotel in Darwin, Ketherine and GP for 9 nights during November 12-20 will be charged to Tsuda's credit card.
- (2) As meals are not included at a hotel in Darwin (November 12-13 and 20) and Ketherine (November 14-19), \$50/day will be provided. While, at the fishing lodge at GP (November 14-19) three meals will be served.
- (3) We would like to offer \$50/day for 9 days as a reward for assisting experiments during November 12-20.

For example, those who are going to GP and Katherine will receive (2) 50x3 + (3) 50x9 = 600, and (2) 50x9 + (3) 50x9 = 900, respectively.

11. Notes by Nigel Mules

Garden Point is a small aboriginal community with a few facilities which I have found out from the fishing lodge include:

- a bakery for morning tea if you get hungry.
- a Post Office.
- a Commonwealth Bank eftpos facility that costs \$5 per transaction.
- a shop that sells small supplies such as soap, tinned food etc.

Garden point is a 'dry' community but the fishing lodge has a permit for alcohol to be consumed on their premises. So if you enjoy wine or beer with your meals you can bring it with you but it must have the name "Mark's Barra Safaris" written on it so Airnorth know it is to be consumed there. Beer can be purchased at the lodge but is about \$74 a carton (that is not a typo). For those operating at Katherine you will be accommodated at a tourist resort Knotts Crossing which has all facilities, swimming pool, bistro. bar etc. The observation site is located at the civilian airport about 16 km south of Katherine so some travel will be involved. The weather will be hot and humid during the day and cooling down to low 20's at night so a few things to consider packing include:

- Hat, light clothes, long sleeve shirts if you burn easily.
- Sunscreen
- Insect repellent
- Torch
- Personal toiletries
- Water bottle

Suggest for both sites if possible to organize a clock radio, to provide a means of checking the time (important) and to keep in touch with the rest of the world when working.

(contact for use of shed at launching site)

- (D) Photos from October campaign (by Robert Goler)
 http://www.maths.monash.edu.au/~robert/Weather/Dawex/Day1/today.html

2. Observation periods: December 11-16, 2001

The observation period is selected around a new moon (22:27 LT on December 15) so as to coordinate with CCD imager observations. We will start launching at 14:45 LT (5:15 Z) on the first day (December 11), and finish the last launch at 11:45 LT (2:15 Z) on the last day (December 16).

3. Launch sites

site A: BOM weather station at Darwin airport (about 50-100 km from Hector)

site B: Civillian airport in Katherine (about 300 km from Hector)

site C: Garden Point (Pirlangimpi) on Tiwi islands (0 km from Hector)

Open field near a fishing lodge

4. Schedule

December 8

Kyoto team (Toshitaka Tsuda, Yuichi Aoyama and Takayuki Yoshihara) arrives Darwin at 12:35 by QF824

December 9

Adelaide group (Robert Vincent, Andrew MacKinnon, Simon Alexander and Peter Love) also arrive at 10:35.

7 (Tsuda, Aoyama, Yoshihara, m, Simon, Andrew and Stewart), 2 (Bob and Andrew) and Ross go to Katherine.

Tim Barnes arrives at 19:03 on December 9.

December 10

6 (Bob, Andrew, Peter, Tim, Rob and Sylvain) goes to Garden Point; by Wimray leaving at $8:00\,\mathrm{AM}$

Set-up radiosonde equipment

December 11 System check

First launch at 14:45 CST (5:15 Z)

December 12-15 Continue 8 launches/day every 3 hours (see Launch Schedule)

December 16 Last launch at 11:45 LT (2:15 Z)

Clean-up the sites, and return to Darwin

From Garden Point; a flight leaving at 5:00 PM

NOTE: Mark will arrange a barge.

Summary Meeting at Tim's on the bay from 7:30 PM

5. Equipment

- (1) Receiver: VAISALA digiCola (Marwin) from Monash and BOM
- (2) Radiosonde: **RS80-15G (PTU + GPS winds)** x 40 at GP and Katherine **RS80 (PTU) with a radar winds** x 40 at Darwin
- (3) Balloon: **TX-800** (800 gram) x 40 at each site
- (4) Helium gas at remote sites
- (5) Parachutes (Radar reflector was used in October.)
- (6) Ground-check: VAISLA kit and a barometer
- (7) tents (wind shelter)
- (8) Mobile Phones: 2 mobile phones are available at Katherine. One should be kept at the launch site. (408)-578-287 (409)-383-485

6. Launch schedule

Considering a routine launch schedule (* in the table) at the Darwin meteorological station, we will launch 8 balloons/day every 3 hours at 2:45 LT, 5:45 LT, 8:45 LT, 11:45 LT, 14:45 LT, 17:45 LT, 20:45 LT and 23:45 LT.
