

DEGENERACY OF HOLOMORPHIC MAPS OMITTING HYPERSURFACES

Fumio Sakai

Let  $W$  be a projective algebraic manifold of dimension  $n$  and  $D$  a hypersurface on  $W$ . Let  $f: \mathbb{C}^n \rightarrow W-D$  be a holomorphic map. We say that  $f$  is degenerate if the Jacobian of  $f$  vanishes identically. In this note, we shall deal with the influence of the singularity of  $D$  on degeneracy theorems of  $f$ .

1. Notations

A hypersurface  $D$  on  $W$  is said to have simple normal crossings if each irreducible component of  $D$  is non-singular and  $D$  has normal crossings, i.e.,  $D$  is locally given by  $w_1 \cdots w_j = 0$ , where  $(w_1, \dots, w_n)$  are local coordinates of  $W$ .

Let  $L$  be a line bundle on  $W$ . Let  $h^i(L) = \dim H^i(W, \mathcal{O}(L))$ . The  $L$ -dimension  $\kappa(L, W)$  of  $W$  is roughly the polynomial order of  $h^0(mL)$  as a function of positive integers  $m$ . Note that  $\kappa(L, W)$  takes one of the values  $-\infty, 0, 1, \dots, n$ . Here we need the following fact:  $\kappa(L, W) = n$  if and only if

$$\limsup_{m \rightarrow +\infty} m^{-n} h^0(mL) > 0.$$

If  $c_1(L) > 0$ , then  $\kappa(L, W) = n$ . For a divisor  $D$ , we denote by  $[D]$  the associated line bundle. We write  $\kappa(D, W) = \kappa([D], W)$ .

2. Degeneracy theorem

Picard's theorem states that any holomorphic map  $f: \mathbb{C} \rightarrow \mathbb{P}_1$

omitting three points is a constant map. We begin with the following generalization of this theorem.

Theorem 1 ([15], see also [2],[10]). Let  $W$  be a projective algebraic manifold of dimension  $n$  and  $D$  a hypersurface on  $W$ .

Suppose that

- (i)  $\kappa(K_W + D, W) = n$ , where  $K_W$  is the canonical bundle of  $W$ ,
- (ii)  $D$  has simple normal crossings.

Then any holomorphic map  $f: \mathbb{C}^n \longrightarrow W - D$  is degenerate.

Remark. In case  $W = \mathbb{P}_n$  and  $D =$  a hypersurface of degree  $d$ , the hypothesis (i) is satisfied if and only if  $d \geq n+2$ .

The following example shows that we cannot remove the hypothesis (ii).

Example 1. Let  $W = \mathbb{P}_2$  and  $D = \{w_0^{d-1}w_2 - w_1^d = 0\}$ , where  $[w_0:w_1:w_2]$  are homogeneous coordinates of  $\mathbb{P}_2$ . By the above remark, if  $d \geq 4$ , the hypothesis (i) is satisfied.  $D$  has only one singularity at  $[0:0:1]$ . Define a holomorphic map  $f: \mathbb{C}^2 = (z_1, z_2) \longrightarrow \mathbb{P}_2$  by  $f(z_1, z_2) = [1:z_1:z_1^d + e^{z_2}]$ . Then  $f$  omits  $D$  and the Jacobian of  $f$  is

$$J_f = \begin{vmatrix} 1 & 0 \\ dz_1^{d-1} & e^{z_2} \end{vmatrix} = e^{z_2} \neq 0.$$

In what follows, we shall consider the question: what happens when  $D$  has worse singularities than simple normal crossings in Theorem 1?

### 3. Resolution of singularities

Let  $W$  be a projective algebraic manifold of dimension  $n$  and

D a hypersurface on W. If D does not satisfy the hypothesis (ii) in Theorem 1, by desingularizing D, we can find W\* and D\* satisfying the following conditions:

- (i)  $\pi:W^* \longrightarrow W$  is a composite of monoidal transformations,
- (ii)  $\pi:W^*-D^* \longrightarrow W-D$  is biholomorphic,
- (iii)  $D^* =$  the support of  $\pi^*D$ ,
- (iv) D has simple normal crossings.

From Theorem 1, it follows

Theorem 2. If  $\kappa(K_{W^*+D^*}, W^*) = n$ , then any holomorphic map  $f:\mathbb{C}^n \longrightarrow W-D$  is degenerate.

Proof. It suffices to consider f as a holomorphic map to  $W^*-D^*$ , q.e.d.

To calculate  $\kappa(K_{W^*+D^*}, W^*)$ , we study the process of the desingularization, in which we have a sequence of monoidal transformations  $\pi_i:W_{i+1} \longrightarrow W_i$  with non-singular centers  $C_i$  such that

- |   |  |
|---|--|
| <ul style="list-style-type: none"> <li>(i) <math>W_0=W, W_\ell=W^*</math>,</li> <li>(ii) <math>D_i =</math> the support of <math>\pi_{i-1}^*D_{i-1}</math>,</li> <li>(iii) <math>D_\ell=D^*</math>, which has simple normal crossings.</li> </ul> | $  \begin{array}{ccc}  W^*=W_\ell & \supset & D_\ell=D^* \\  \downarrow & & \downarrow \\  \vdots & & \vdots \\  \downarrow & & \downarrow \\  W_1 & \supset & D_1 \\  \downarrow \pi_0 & & \downarrow \pi_0 \\  W=W_0 & \supset & D_0=D  \end{array}  $ |
|---|--|

Define

- $\bar{D}_i =$  the strict transform of  $D_{i-1}$  by  $\pi_{i-1}$ ,
- $E_i =$  the exceptional locus of  $\pi_{i-1}$ , i.e.,  $\pi_{i-1}^{-1}(C_{i-1})$ ,
- $\delta_i =$  the codimension of  $C_i$  in  $W_i$ ,

$v_i$  = the multiplicity of the singular locus of  $D_i$  at  $C_i$ .

Then we have

$$(1) \quad \begin{aligned} D_i &= \bar{D}_i + E_i, \quad \pi_{i-1}^* D_{i-1} = \bar{D}_i + v_{i-1} E_i, \quad K_{W_i} = \pi_{i-1}^* K_{W_{i-1}} + [(\delta_{i-1} - 1) E_i], \\ K_{W_i} + [D_i] &= \pi_{i-1}^* (K_{W_{i-1}} + [D_{i-1}]) + [(\delta_{i-1} - v_{i-1}) E_i]. \end{aligned}$$

Example 2. We examine the cusp  $D = \{y^2 = x^3\}$ .

Proposition 1.  $\kappa(K_{W^*} + D^*, W^*) \leq \kappa(K_W + D, W)$ .

This follows from properties (1), and further if  $D$  has simple normal crossings, the equality holds. Moreover we have the following

Proposition 2. Let  $f: V' \rightarrow V$  be a birational morphism, where  $V', V$  are projective algebraic manifolds. Let  $D$  be a hyper-surface on  $V$  and put  $D'$  = the support of  $f^*D$ . Then

$$\kappa(K_{V'} + D', V') \leq \kappa(K_V + D, V).$$

Remark.  $\kappa(K_{W^*} + D^*, W^*)$  is independent of the desingularization  $W^*, D^*$ . In fact let  $W_1, D_1$  be another desingularization of  $D$ . There exists a desingularization  $W^{**}, D^{**}$ , which is obtained by a sequence of monoidal transformations of  $W^*$ , with centers over  $D^*$ , such that there is a birational morphism  $\phi: W^{**} \rightarrow W_1$ . The assertion follows from the above propositions.

Definition. We say that  $D$  has quasi-negligible singularities if  $v_i \leq \delta_i$  holds for  $i=0, \dots, l-1$ .

Proposition 3 ([15]). If  $D$  has quasi-negligible singularities, then  $\kappa(K_{W^*+D^*}, W^*) = \kappa(K_W+D, W)$ .

Proof. By (1), we have

$$\kappa(K_{W_i+D_i}, W_i) \geq \kappa(\pi_{i-1}^*(K_{W_{i-1}+D_{i-1}}), W_i) = \kappa(K_{W_{i-1}+D_{i-1}}, W_{i-1}).$$

Hence we have  $\kappa(K_{W^*+D^*}, W^*) \geq \kappa(K_W+D, W)$ , which proves Proposition 3.

Thus the hypothesis (ii) in Theorem 1 can be weakened as:

(ii)\*  $D$  has quasi-negligible singularities.

#### Examples of quasi-negligible singularities

- (i) normal crossing is quasi-negligible,
- (ii) a curve has quasi-negligible singularities if and only if its singularities are ordinary double points,
- (iii) the isolated singularity  $w_1^d + \dots + w_n^d = 0$  is quasi-negligible if  $d \leq n$  (this type appeared in Carlson [1]),
- (iv) on surfaces the singularity defined by  $w_1^2 + w_2^2 + w_3^{k+1} = 0$  (type  $A_k$ ) is quasi-negligible.

Proposition 4 ([15]). If the Kodaira dimension  $\kappa(W) = \kappa(K_W, W) \geq 0$ , then we have  $\kappa(K_{W^*+D^*}, W^*) = \kappa(K_W+D, W)$ .

Therefore in case  $\kappa(W) \geq 0$ , the hypothesis (ii) can be removed. This leads us to study the case  $\kappa(W) < 0$ . Note that  $\kappa(W) < 0$  if and only if  $h^0(mK_W) = 0$ , for every positive integer  $m$ .

In case  $n=2$ , a surface  $S$  with  $\kappa(S) < 0$  is birationally equivalent to  $\mathbb{P}_1 \times C$ , where  $C$  is a curve (ruled surface). We have

Proposition 5. Let  $S$  be an algebraic surface and  $D$  a curve on  $S$ . If  $(K_S + D)^2 - (v_0 - 2)^2 - \dots - (v_{\ell-1} - 2)^2 > 0$ , then  $\kappa(K_S + D, S) = 2$  implies  $\kappa(K_{S^*} + D^*, S^*) = 2$ .

Proof. By (1), putting  $\delta_i = 2$ , we get

$$\begin{aligned} (K_{S_i} + D_i)^2 &= (\pi_{i-1}^* (K_{S_{i-1}} + D_{i-1}) + (2 - v_{i-1}) E_i)^2 \\ &= (K_{S_{i-1}} + D_{i-1})^2 - (v_{i-1} - 2)^2. \end{aligned}$$

Hence we obtain

$$(K_{S^*} + D^*)^2 = (K_S + D)^2 - (v_0 - 2)^2 - \dots - (v_{\ell-1} - 2)^2 > 0.$$

Let  $\Gamma = K_S + [D]$ ,  $\Gamma^* = K_{S^*} + [D^*]$ . Using this notations we have  $\Gamma^* \cdot \Gamma > 0$ .

We infer from the Riemann-Roch theorem that

$$h^0(m\Gamma^*) + h^2(m\Gamma^*) \geq \frac{1}{2} m\Gamma^* (m\Gamma^* - K_{S^*}) + p_a(S^*).$$

Note that  $h^2(m\Gamma^*) = h^0(K_{S^*} - m\Gamma^*) \leq h^0(-(m-1)\Gamma^*)$ . Thus the above inequality shows that either  $h^0(m\Gamma^*) > 0$ , or  $h^0(-(m-1)\Gamma^*) > 0$ , for large  $m$ . By (1),  $\Gamma^* = \pi^*(\Gamma) - [\mathcal{E}]$ ,  $\mathcal{E}$  is an exceptional divisor of  $\pi$ . If  $h^0(-(m-1)\Gamma^*) > 0$ , then  $h^0(-(m-1)(\Gamma^* + [\mathcal{E}])) = h^0(-(m-1)\Gamma) > 0$ , which is a contradiction. Hence  $h^0(m\Gamma^*) \geq \frac{1}{2} (\Gamma^*)^2 m^2 + \dots$ , which proves  $\kappa(\Gamma^*, S^*) = 2$ , q.e.d.

Example 3. Let  $S = \mathbb{P}_2$  and  $D =$  a hypersurface of degree  $d$ . The hypothesis in the above proposition is

$$(d-3)^2 - (v_0 - 2)^2 - \dots - (v_{\ell-1} - 2)^2 > 0.$$

Let  $\kappa^* = \kappa(\Gamma^*, S^*)$ . We give some examples:

(i) four lines meeting at one point,

$$\Gamma^*^2 = -1, \quad \kappa^* = -\infty,$$

(ii) a conic and two lines meeting at one point,

$$\Gamma^*^2 = 0, \quad \kappa^* = 1,$$

(iii) a quintic with two cusps,

$$\Gamma^*^2 = 2, \quad \kappa^* = 2,$$

(iv) the curve in Example 1,

$$\Gamma^*^2 < 0, \quad \kappa^* = -\infty.$$

Remark. Let  $V', V$  be projective algebraic manifold of dimension  $n$  and let  $f: V' \rightarrow V$  be a finite morphism. For a hypersurface  $D$  on  $V$ , let  $D'$  = the support of  $f^*D$ . Then it is easily seen that  $\kappa(K_{V'} + D', V') \geq \kappa(K_V + D, V)$ . Let  $V'^*, D'^*$  and  $V^*, D^*$  be desingularizations of  $V', D'$  and  $V, D$ , respectively. Is it true that

$$\kappa(K_{V'^*} + D'^*, V'^*) \geq \kappa(K_{V^*} + D^*, V^*) ?$$

#### 4. Concluding Remarks

Let  $M$  be a complex manifold of dimension  $n$ . We define the following properties of  $M$ .

(ED)<sub>k</sub> Every holomorphic map  $f: \mathbb{C}^k \times \mathbb{D}^{n-k} \rightarrow M$  is degenerate, where  $\mathbb{D}$  is the unit disk  $\{z \mid |z| < 1\}$ ,

(HD)<sub>k</sub> Every holomorphic map  $f: \mathbb{C}^k \rightarrow M$  is degenerate in the sense that the rank of the Jacobian matrix of  $f$  is not maximal anywhere.

(AD)<sub>k</sub> Every holomorphic map  $f: \mathbb{C}^k \rightarrow M$  is algebraically degenerate, i.e., the image  $f(\mathbb{C}^k)$  is contained in a proper subvariety of  $M$ .

Obviously we have the following relations:

$$\begin{array}{ccc}
 (\text{HD})_k & \longrightarrow & (\text{ED})_k \\
 \downarrow & & \downarrow \\
 (\text{HD})_{k+1} & \longrightarrow & (\text{ED})_{k+1}
 \end{array}
 \qquad (\text{HD})_n = (\text{ED})_n$$

The proof of Theorem 1 ([15]) implies the following stronger form of Theorem 1. (The conclusion of Theorem 1 is  $(\text{ED})_n$ .)

Theorem 4. Under the same assumptions on  $W$  and  $D$  as in Theorem 1,  $M=W-D$  satisfies property  $(\text{ED})_1$ .

Proof.\*) Let  $D_r = \{z \mid |z| < r\}$ . Replacing  $B[r]$  in [15] by  $D_r^n$ , we have the following Schottky-Landau theorem.

Theorem ([15]). Assume the same assumptions on  $W$  and  $D$  as in Theorem 1. Let  $f: D_r^n \rightarrow W-D$  be a holomorphic map with  $J_f(0) \neq 0$ . Then  $r^{2n} < C |J_f(0)|^{-2}$ , where  $C$  is a constant depending only on  $f(0)$ .

We proceed to the proof of Theorem 4. Assume that there exists a non-degenerate holomorphic map  $f: \mathbb{C} \times D^{n-1} \rightarrow W-D$ . By a translation of coordinates, we may assume that there exists a holomorphic map  $f: \mathbb{C} \times D_{r_0}^{n-1} \rightarrow W-D$ , with  $r_0 < 1$ ,  $J_f(0) \neq 0$ . Define a holomorphic map  $\psi: D_r^n \rightarrow \mathbb{C} \times D_{r_0}^{n-1}$  by

\*) This type of argument is due to I.Nakamura.

$$\psi : (z_1, \dots, z_n) \longrightarrow \left( \left( \frac{r}{r} \right)^{n-1} \frac{z_1}{a}, \frac{r}{r} z_2, \dots, \frac{r}{r} z_n \right),$$

where  $a = |J_f(0)|$ . Let  $g = f \circ \psi$ . Since  $|J_g(0)| = |J_f(\psi(0))| |J_\psi(0)| = 1$ , we obtain a holomorphic map  $g: \mathbb{D}_r^n \longrightarrow W-D$ , with  $|J_g(0)| = 1$  for arbitrary  $r$ , which contradicts the above theorem, q.e.d.

Several degeneracy theorems are known.

Theorem (Fujimoto [4], Green [6]). Let  $H_1, \dots, H_{n+k}$  be hyperplanes in general position in  $\mathbb{P}_n$ . Let  $M = \mathbb{P}_n - H_1 \cup \dots \cup H_{n+k}$ . Then any holomorphic map  $\mathbb{C}^i \longrightarrow M$  is contained in a linear subspace of dimension  $\lfloor \frac{n}{k} \rfloor$ .

Corollary. If  $k \geq n+1$ , then  $M$  satisfies property  $(HD)_1$ .

Corollary (Green [6]). Let  $H_1, \dots, H_d$  be hyperplanes in  $\mathbb{P}_n$  in arbitrary position. Then  $M = \mathbb{P}_n - H_1 \cup \dots \cup H_d$  satisfies properties  $(AD)_1$  and  $(ED)_n$  if  $d \geq n+2$ .

Corollary (Green [6], p.39). Let  $W$  be a complex manifold of dimension  $n$  and let  $D_1, \dots, D_k$  be hypersurfaces on  $W$  such that each  $D_i \in |L|$ , for a fixed line bundle  $L$ . Let  $s_i$  be the section defining  $D_i$ . If the algebraic dimension  $a$  of  $(s_1, \dots, s_k) \leq k-2$ , then  $M = W - D_1 \cup \dots \cup D_k$  satisfies properties  $(AD)_1$  and  $(ED)_{n-a+1}$ .

Theorem (Green [6], cf. Fujimoto [5]). Let  $D$  be a Fermat variety  $w_0^d + \dots + w_n^d = 0$ , in  $\mathbb{P}_n$ , where  $[w_0 : \dots : w_n]$  are homogeneous coordinates of  $\mathbb{P}_n$ . If  $d > n(n+1)$ , then  $\mathbb{P}_n - D$  satisfies properties  $(AD)_1$  and  $(ED)_1$  ( $(ED)_1$  is a consequence of Theorem 4).

Theorem(Green [8]). Let  $D$  be a non-singular curve of degree  $d$  in  $\mathbb{P}_2$ . Let  $D^*$  be the dual curve of  $D$  in the dual projective space  $\mathbb{P}_2^*$ . If  $d \geq 3$ , then  $\mathbb{P}_2^* - D^*$  satisfies property  $(HD)_1$ .

Theorem( [15]). Let  $A$  be an abelian variety of dimension  $n$  and  $D$  an arbitrary hypersurface on  $A$ . Then  $A - D$  satisfies property  $(ED)_n$ .

Example 4. Let  $X_a = \{z_1^{a_1} + \dots + z_n^{a_n} = 0\}$  in  $\mathbb{C}^n$ . If  $\sum_{i=1}^n \frac{1}{a_i} < 1$ , then  $\mathbb{C}^n - X_a$  satisfies property  $(ED)_2$ .

Proof. Let  $U_a = \{z_1^{a_1} + \dots + z_n^{a_n} = 1\}$ . Then  $\mathbb{C} \times U_a$  is an unramified covering of  $\mathbb{C}^n - X_a$ . By the assumption,  $U_a$  satisfies property  $(ED)_1$  (see [15]). So  $\mathbb{C} \times U_a$  and  $\mathbb{C}^n - X_a$  satisfy property  $(ED)_2$ .
