(A Note on Isolated Singularity)

Isao NARUKI

0. Notation

(X, x) : pair of analytic space and $x \in X$ such that $X \setminus x$ smooth.

$\iota: X \setminus x \hookrightarrow X$ (inclusion).

Ω_X^p : sheaf of (analytic) p -forms on X ($\mathcal{O}_X = \Omega_X^0$).

1. Duality

$$\text{Lemma 1. } R^q \iota_* \iota^* \Omega_X^p \xleftarrow{\text{dual}} R^{n-q-1} \iota_* \iota^* \Omega_X^{n-p}.$$

($1 \leq q \leq n-2$, $n = \dim X$).

Proof. Andreotti-Grauert [1].

2. Coherence of Local Cohomology

Lemma 2. S : coherent \mathcal{O}_X -Modele, $S|_{X \setminus x}$: locally free
 $\Rightarrow H_x^q(S)$: coherent for $q < \dim X$

Proof. Siu [7].

3. Condition (L), Poincaré Lemma

Definition. (X, x) satisfies (L) $\Leftrightarrow H_x^q(\Omega_X^p) = 0$ if $p+q < \dim X$.

Lemma 3. (Partial Poincaré Lemma). (X, x) satisfies (L)
 $\Rightarrow H_x^p(\Omega_{X, x}^{\cdot}) = 0$ ($0 < p < \dim X$).

Proof. Bloom-Herrera [2].

4. Nice Function, Hypersurfacesection

analytic

Definition. $f: X \xrightarrow{\text{analytic}} \mathbb{C}$ is nice on (X, x)

$$\Leftrightarrow f(x)=0, \quad df_z \neq 0 \quad (\forall z \in X \setminus x).$$

(Y, y) : hypersurfacesection of (X, x)

$$\Leftrightarrow \exists f: \text{nice on } (X, x) \text{ such that } (Y, y) \xrightarrow{\text{iso.}} (f^{-1}(0), x).$$

Lemma 4 (de Rham Lemma). $f: \text{nice on } (X, x)$, (X, x) satisfies
 $(L) \Rightarrow 0 \rightarrow \Omega_X^0 \xrightarrow{df} \Omega_X^1 \rightarrow \dots \rightarrow \Omega_X^{\dim X} \text{ exact.}$

5. Conservation of (L) .

Let (Y, y) : hypersurface section of (X, x)

Theorem 1. (X, x) satisfies (L)

$$\Leftrightarrow \begin{cases} \text{i) } (Y, y) \text{ satisfies } (L) \\ \text{ii) } \dim \mathcal{H}_y^0(\Omega_Y^n) = \dim \mathcal{H}_y^1(\Omega_Y^n) \end{cases}$$

$$(n = \dim Y \geq 2)$$

Corollary. (X, x) : a complete intersection of hypersurfaces

$$\Rightarrow (X, x) \text{ satisfies } (L)$$

Proof. Hamm [4].

6. Milnor Fibering

Let $f: \text{nice on } (X, x)$, (Y, y) : hypersurface section defined by f . We can assume by Milnor [6]

- a) $(Y, y) \hookrightarrow (X, x) \xrightarrow{\text{closed}} (B, 0)$ (B : open ball in $\mathbb{C}^N : (z_1, z_2, \dots, z_N)$)
- b) $r|_{X \setminus x}, r|_{Y \setminus y}$ have no critical point ($r(z) = \sum_{i=1}^N |z_i|^2$)

Theorem 2. Under the above assumption, $\exists S$: a neighborhood of 0 in C such that i) $R^p f_*(\Omega_f^\cdot)|S$ are coherent \mathcal{O}_S -Modules
ii) $H^p(\Omega_{f,x}^\cdot) \cong R^p f_*(\Omega_f^\cdot)_0$

where we have set $\Omega_f^p = \Omega_X^p / df \wedge \Omega_X^{p-1}$ ($p=0,1,2,\dots$).

Proof. Brieskorn [3] and Kiehl-Verdier [5].

7. Main Theorem

Theorem 3. (X,x) , f , (Y,y) , Ω_f^\cdot as in §6, (X,x) satisfies (L)

⇒

- i) $H^p(\Omega_{f,x}^\cdot) = 0 \quad 1 \leq p \leq n-1 \quad (n = \dim Y).$
- ii) $H^n(\Omega_{f,x}^\cdot)$: free $\mathcal{O}_{C,0}$ -module of finite rank.
- iii) $\mu = \text{rank}_{\mathcal{O}_{C,0}} H^n(\Omega_{f,x}^\cdot) = \dim_{\mathcal{O}} H^n(''\Omega_{Y,y}^\cdot)$
 $(''\Omega_Y^\cdot = 0 \rightarrow \Omega_Y^0 \xrightarrow{d} \Omega_Y^1 \xrightarrow{d} \cdots \xrightarrow{d} \Omega_Y^n \rightarrow 0).$
- iv) $\mu = \dim R^1 i_* i^* \Omega_Y^{n-1} + \dim H^n(i_* i^* \Omega_Y^\cdot) - \dim H^{n-1}(i_* i^* \Omega_p^\cdot)$
- v) In case (X,x) is smooth, there are isomorphisms i

$$\mathcal{H}_y^0(\Omega_Y^{n+1}) \xrightarrow{i} \mathcal{H}_y^1(\Omega_Y^n) \xrightarrow{i} \cdots \xrightarrow{i} \mathcal{H}_y^{n-1}(\Omega_Y^2)$$

$$\mathcal{H}_y^1(\Omega_Y^{n-1}) \xrightarrow{i} \mathcal{H}_y^2(\Omega_Y^{n-2}) \xrightarrow{i} \cdots \xrightarrow{i} \mathcal{H}_y^{n-1}(\Omega_Y^1).$$
