

Parametrices for Degenerate Operators  
of Grushin's Type

CHISATO TSUTSUMI

Department of Mathematics, Osaka University

Introduction. Grushin studied the hypoellipticity of an degenerate operator  $A$  of the form given in §1. In his paper [2] he used operator valued pseudo-differential operators essentially.

In this note we construct a left parametrix  $Q$  for the operator  $A$  as a pseudo-differential operator by symbol calculus instead of his method. For the construction of  $Q$ , we use the fundamental solution of parabolic equation studied in [4] and [5]. Also we discuss estimates for  $A$ .

We give main theorems and several examples in §1. In §2 and §3 the method of construction of  $Q$  will be shown. We devote §4 for proves of Theorem B and Theorem C.

§1. Main theorems and examples.

In this note we treat operators defined in  $R^3$  for simplicity. Consider an operator

$$(1) \quad A(x_1, y, D_{x_1}, D_{x_2}, D_y) = \sum_{\substack{|\alpha| \leq m \\ (\tau, \gamma) \geq (\tau, \alpha) - m}} a_{\alpha, \gamma} x_1^{\gamma_1} y^{\gamma_3} D_{x_1}^{\alpha_1} D_{x_2}^{\alpha_2} D_y^{\alpha_3}$$

where  $a_{\alpha, \gamma}$  are constants,  $D_j = \partial/\partial(x_j)$ ,  $\alpha = (\alpha_1, \alpha_2, \alpha_3)$ ,  $\tau = (\tau_1, \tau_2, 1)$ ,

$\tau_j \geq 1$  ( $j=1, 2$ ),  $\gamma = (\gamma_1, 0, \gamma_3)$ ,  $\sigma = (\sigma_1, 0, 1)$ ,  $\min(\tau_1, \tau_2) > \sigma_1 > 0$

$$\text{and } (\tau, \alpha) = \sum_{j=1}^3 \tau_j \alpha_j$$

Let  $A_0$  be the principal part of  $A$  in a sense, that is,

$$(2) \quad A = A(x_1, y, D_{x_1}, D_{x_2}, D_{x_3}) = \sum_{\substack{|\alpha| \leq m \\ (\tau, \gamma) = (\tau, \alpha) - m}} a_{\alpha, \gamma} x_1^{\gamma_1} y^{\gamma_3} D_{x_1}^{\alpha_1} D_{x_2}^{\alpha_2} D_y^{\alpha_3}$$

We denote by  $A(x_1, y, \xi, \eta)$  the differential polynomial correspond to  $A_0$ .

Condition 1.  $A_0(x_1, y, D_{x_1}, D_{x_2}, D_y)$  is elliptic for  $|x_1| + |y| \neq 0$   
i.e.

$$A_0(x_1, y, \xi, \eta) \neq 0$$

for  $|x_1| + |y| \neq 0$ ,  $\xi \in \mathbb{R}^2$ ,  $\eta \in \mathbb{R}^1$ , and  $|\xi| + |\eta| \neq 0$ .

Condition 2. For all  $x_1 \in \mathbb{R}^1$  and for all nonzero vector  $\xi \in \mathbb{R}^2$   
the equation  $A_0(x_1, y, \xi, D_y)v(y)=0$  has no nonzero solution in  $\mathcal{J}(\mathbb{R}^1)$ .

We get main theorems as follows.

Theorem A. Under condition 1 and condition 2, there exist a neighbourhood  $\Omega$  of  $x_1=y=0$  and a left parametrix  $Q$  for  $A$  in a class of pseudo-differential operators;

$QA = I + W$  in  $\Omega$ , where  $W$  is a smoothing operator.

By the construction of  $Q$  we get estimates for  $A$  and  $A_0$ .

$$(3)_s \quad \|u\|_{m+s} \leq c_K (\|A_0 u\|_s + \|u\|_s) \quad \forall u \in C_0^\infty(K),$$

$$(4)_s \quad \|u\|_{m+s} \leq c (\|Au\|_{(s)} + \|u\|_{(s)}) \quad \forall u \in C_0^\infty(\Omega),$$

where  $\|\cdot\|_m$  is the usual Sobolev norm,  $K$  is any compact set of such that  $K \cap \{0, x_2, 0\} = \emptyset$ ,  $\|u\|_{(m)} = \|\Lambda_{\tau}^m u\|_0$  and  $\Lambda_{\tau}$  is a pseudo-differential operator with symbol  $\sum_{j=1}^2 |\zeta_j|^{\frac{1}{\tau_j}} + |\eta|^{+1}$ .

Moreover we get the following statement.

If  $Au \in H_{loc}^s(\Omega)$  and  $u \in \mathcal{D}'(\Omega)$ , then  $u \in H_{loc}^{s+m/\bar{\tau}}(\Omega)$

where  $\bar{\tau} = \max(\tau_1, \tau_2)$ .

Remark. If  $\bar{\tau} = 1$ , then condition 1 means that  $A$  is elliptic in case  $|x_1| + |y|$  is sufficient small.

We may assume  $\bar{\tau} > 1$  by the above remark.

Theorem B. If  $(4)_o$  hold, then we obtain the following estimate for all  $x_1 \in \mathbb{R}^1$  and nonzero  $\xi \in \mathbb{R}^2$ .

$$\|v\| \leq c \|A_o(x_1, y, \xi, D_y)v\| \quad \forall v \in \mathcal{J}(\mathbb{R}_y^1)$$

where  $\|\cdot\|$  is the norm in  $L_2(\mathbb{R}_y^1)$ .

Owing to the above theorem we get:

Theorem C. Assume that A satisfies  $(3)_o$  and  $(4)_o$ . Then, A holds condition 1 and condition 2.

Now let us give some examples

Example 1.  $A = A_o = (-\Delta_y)^\ell + y^{2k}(-\Delta_{x_2})^\ell$  in  $\mathbb{R}^2$ ,

where  $\ell$  and  $k$  are positive integers. We can take  $\tau = (1+k/\ell, 1)$ ,

$\sigma = (0, 1)$  and  $m=2$ . In this case condition 1 and condition 2 hold.

Example 2. (Grushin [2]).  $A = A_o = \frac{\partial^2}{\partial y^2} + (y^2 + x_1^2)(\frac{\partial^2}{\partial x_1^2} + \frac{\partial^2}{\partial x_2^2})$

$+ i\lambda \frac{\partial}{\partial x_2}$ . In this case we can choose  $\tau = (2, 2, 1)$ ,  $\sigma = (1, 0, 1)$  and  $m=2$ .

Condition 1 holds. Condition 2 holds if  $|\lambda| < 1$  or  $\text{Im}\lambda \neq 0$ .

Example 3.  $A = A_o = (\frac{\partial}{\partial y} - iay^k \frac{\partial}{\partial x_2})(\frac{\partial}{\partial y} - iby^k \frac{\partial}{\partial x_2}) + icy^{k-1} \frac{\partial}{\partial x_2}$

in  $\mathbb{R}^2$ , where  $k$  is a odd integer,  $a, b$  and  $c$  are real constants such that  $ab < 0$ . In this case  $\tau = (k+1, 1)$ ,  $\sigma = (0, 1)$  and  $m=2$ . Condition 1

always holds. Condition 2 holds if and only if

$$\frac{c}{a-b} \not\equiv 0, 1 \pmod{k+1}.$$

This result is due to Gilioli and Treves [1].

## § 2. Notations and theorems for pseudo-differential operators

For a pair of real vectors  $\beta = (\beta_1, \beta_2, \dots, \beta_n)$  and  $\delta = (\delta_1, \delta_2, \dots, \delta_n)$  we say  $\beta > \delta$  if  $\beta_j > \delta_j$  for all  $j$ . In this section we fix  $\beta$  and  $\delta$  such that  $\beta > \delta \geq 0$ .

**Definition** (cf. [5]). We say that a  $C^\infty$ -function  $\lambda(x, \xi)$  defined in  $R_x^n \times R_\xi^n$  is a basic weight function when  $\lambda(x, \xi)$  satisfies the conditions below:

$$(5) \quad |\lambda_{(\beta)}^{(\alpha)}(x, \xi)| \leq c_{\alpha, \beta} \lambda(x, \xi)^{1-(\beta, \alpha) + (\delta, \beta)}$$

$$(6) \quad 1 \leq \lambda(x+y, \xi) \leq A \langle y \rangle^{-\tau} \lambda(x, \xi) \quad (\tau \geq 0),$$

where  $\lambda_{(\beta)}^{(\alpha)}(x, \xi) = (\partial/\partial \xi_1)^{\beta_1} \dots (\partial/\partial \xi_n)^{\beta_n} (-i\partial/\partial x_1)^{\alpha_1} \dots (-i\partial/\partial x_n)^{\alpha_n}$ ,  $\lambda(x, \xi)$  and  $\langle y \rangle = (|y|^2 + 1)^{1/2}$ .

We denote by  $S_{\lambda, \beta, \delta}^m$  ( $-\infty < m < \infty$ ) the set of all  $C^\infty$ -functions  $p(x, \xi)$  defined in  $R_x^n \times R_\xi^n$  which satisfies for any  $\alpha$  and  $\beta$

$$|p_{(\beta)}^{(\alpha)}(x, \xi)| \leq c_{\alpha, \beta} \lambda(x, \xi)^{m-(\beta, \alpha) + (\delta, \beta)}$$

for some constants  $c_{\alpha, \beta}$ . For a symbol  $p(x, \xi) \in S_{\lambda, \beta, \delta}^m$  we define

a pseudo-differential operator by

$$Pu(x) = p(x, D_x)u(x) = \int e^{ix \cdot \xi} p(x, \xi) \hat{u}(\xi) d\xi,$$

where  $d\xi = (2\pi)^{-n} d\xi$  and  $\hat{u}(\xi)$  denote the Fourier transform of  $u(x)$

in  $\mathcal{S}$  defined by

$$\hat{u}(\xi) = \int e^{-ix \cdot \xi} u(x) dx.$$

We call a pseudo-differential operator a smoothing operator when its symbol belongs to  $S^m_{\langle \xi \rangle, \rho, \delta}$  for any  $m$ .

Now consider a pseudo-differential operator of parabolic type.

$$L = \frac{\partial}{\partial t} + p(x, D_x)$$

We call an operator  $E(t)$  a fundamental solution for  $L$  when  $E(t)$  satisfies

$$\begin{cases} L E(t) = 0 & \text{in } 0 < t < \infty, \\ E(0) = I \end{cases}$$

By [5], we get the next theorem

Theorem 1. Assume that  $p(x, \xi) \in S^{\ell}_{\lambda, \rho}$ , satisfies

$$\operatorname{Re} p(x, \xi) + c \geq c_0 \lambda(x, \xi)^{\ell}$$

for positive constants  $c$  and  $c_0$ . Then, there exists a fundamental solution  $E(t)$  which belongs to  $S^0_{\lambda, \rho, \delta}$  with parameter  $t$  and whose

symbol  $e(t; x, \xi)$  has the following expansion

$$e(t; x, \xi) = \sum_{j=0}^{N-1} e_j(t; x, \xi) + r_N(t; x, \xi)$$

where  $e_j(t; x, \xi) \in S_{\alpha, \beta, \delta}^{-\omega j}$ ,  $r_N(t; x, \xi) \in S_{\alpha, \beta, \delta}^{\ell - \omega N}$ ,  $\omega = \min(\beta_j - \delta_j)$  and

$N$  is any number such that  $\omega N \geq \ell$ . Moreover we get  $e_0(t; x, \xi)$

$$= \exp \{ -tp(x, \xi) \} \text{ and}$$

$$e_j(\alpha, \beta)(t; x, \xi) = a_{j, \alpha, \beta}(t; x, \xi) e_0(t; x, \xi) \quad (j \geq 1),$$

where  $a_{j, \alpha, \beta}(t; x, \xi)$  satisfy

$$\left| a_{j, \alpha, \beta}(t; x, \xi) \right| \leq c_{j, \alpha, \beta} \lambda(x, \xi)^{-\omega j - (\beta, \alpha) + (\delta, \beta)}$$

$$\times \prod_{k=2}^{|j|+|\beta|-2} \left\{ t \operatorname{Rep}(x, \xi) \right\}^k$$

About the behavior of  $e(t; x, \xi)$  for large  $t$ , we get.

Theorem 2 (Tsutsumi [5]). Let  $p(x, \xi)$  satisfy the assumption of theorem 1 and

$$\operatorname{Re}(p(x, D_x)u, u) \geq c_1 \|u\|^2 \quad u \in \mathcal{S}(\mathbb{R}^n)$$

with a positive constant  $c_1$ . Moreover let  $\ell > 0$  and  $\lambda(x, \xi)$  satisfy

$$\lambda(x, \xi) \geq a(|\xi| + |x| + 1)^a$$

for some positive constant  $a$ . Then the symbol  $e(t; x, \xi)$  constructed in theorem 1 holds the following estimate for any integers  $j$  and  $k$  and positive constant  $\varepsilon$

$$\lambda(x, \xi)^j \left| \frac{\partial^k}{\partial t^k} p_{\beta}^{(\alpha)}(t+\varepsilon; x, \xi) \right| \leq c(j, k, \alpha, \beta, \varepsilon) \exp(-c_2 t) \quad (t \geq 0)$$

for any  $\alpha$  and  $\beta$ ,

where  $c_2$  is any constant less than  $c_1$  and  $c(j, k, \alpha, \beta, \varepsilon)$  is independent of  $t$ .

Now assume that the basic weight function  $\lambda(x, \xi)$  is independent of  $x$  and  $b^{-1} |\xi|^{k_1} \leq \lambda(\xi) \leq b |\xi|^{k_2} \quad (k_1, k_2 > 0)$ .

We denote the Sobolev norm  $\| \cdot \|_{m, \lambda}$  by

$$\|u\|_{m, \lambda} = \|\lambda(D_x^m u)\|$$

where  $\| \cdot \|$  is the norm in  $L^2(\mathbb{R}^n)$ .

Let  $\Omega$  be an open set in  $\mathbb{R}^n$  and let  $p(x, \xi)$  hold the estimate below

$$(7) \quad \left| p_{\beta}^{(\alpha)}(x, \xi) \right| \leq c_{K, \alpha, \beta} \lambda(\xi)^{M-(\beta, \alpha)+(\delta, \beta)} \quad \forall x \in K$$

for any compact set  $K$  in  $\Omega$ .

Theorem 3 (Tsutsumi [6]). Let  $P = p(x, D_x)$  satisfy (7) and

$$\|u\|_{m, \lambda}^2 \leq c_K (\|Pu\| + \|u\|_{m, \lambda}) \quad u \in C_0^\infty(K).$$

where  $M \geq m \geq 0$ ,  $m > m'$  and  $K$  is any compact set in  $\Omega$ . Then, for every  $K$  and every integer  $N$  one can find  $C$  so that when  $x \in K$  and  $\xi \in \mathbb{R}^n$

$$\lambda(\xi)^{2m} \|\psi\|^2 \leq C \int \left| \sum_{|\alpha+\beta| \leq N} p_{\{\beta\}}^{(\alpha)}(x, \xi) \lambda(\xi)^{(\alpha, \alpha-\beta)} y^{\beta} D_y^{\alpha} \psi / \alpha! \beta! \right|^2 dy \\ + \lambda(\xi)^{2M-2\varepsilon_0 N+d_1} \left( \sum_{\substack{\alpha, \beta, \gamma \in \mathbb{N}^d \\ |\alpha| \leq M, |\beta| \leq N, |\gamma| \leq d_2}} \left( \int |y^{\beta} D_y^{\alpha} \psi|^2 dy \right) \right), \quad \psi \in C_0^\infty(\mathbb{R}^n)$$

Here  $\Theta = (\theta_1, \theta_2, \dots, \theta_n)$  is chosen such that  $\varepsilon_0 = \min(\delta_j - \theta_j, \theta_j - \delta_j, \theta_j) > 0$  and both  $d_1$  and  $d_2$  are constants independant of  $N$ .

### § 3. Outline of construction of a left parametrix $Q$ .

We introduce some notations.

$$h = h(x_1, y) = (|x_1|^{\frac{1}{\alpha_1}} + |y|) \\ \nu = \nu(x_1, y, \xi, \eta) = \sum_{j=1}^3 h(x_1, y)^{\frac{1}{\alpha_j}} |\xi_j| + |\eta| \\ \mu = \mu(\xi) = \sum_{j=1}^3 |\xi_j|^{1/\alpha_j} + 1 \\ \chi = \chi(\xi, \eta) = \sum_{j=1}^3 |\xi_j| + |\eta| + 1$$

We denote by  $S^m(\nu, \mu, \chi)$  ( $-\infty < m < \infty$ ) the set of all  $C^\infty$ -functions

$p(x_1, y, \xi, \eta)$  defined in  $\mathbb{R}_{x_1}^1 \times \mathbb{R}_y^1 \times \mathbb{R}_\xi^2 \times \mathbb{R}_\eta^1$  which satisfy

$$(8) \quad \left| p_{\{\beta\}}^{(\alpha)}(x_1, y, \xi, \eta) \right| \leq C_{\alpha, \beta} (\nu + \mu)^{m - |\beta|} \mu^{|\beta| + \alpha_1 |\beta|} \chi^{-|\alpha_1| - |\alpha_2|}$$

for any  $\alpha = (\alpha_1, \alpha_2, \alpha_3)$ ,  $\beta = (\beta_1, 0, \beta_3)$ . We define a psuedo-differential operator  $Pu(x_1, x_2, y)$  with a symbol  $\sigma(P) = p(x_1, y, \xi, \eta) \in S^m(\nu, \mu, \chi)$  by

$$Pu(x_1, x_2, y) = \int e^{i(x_1 \xi_1 + x_2 \xi_2 + y \eta)} p(x_1, y, \xi, \eta) \hat{u}(\xi, \eta) d\xi d\eta$$

for  $u \in \mathcal{S}(\mathbb{R}^3)$ .

We get the following lemma for operators of this class.

Lemma 1. (Tsutsumi [6]) (i) If  $P_j$  belongs to  $S^m(\nu, \mu, \chi)$  ( $j=1, 2$ ) then  $P_1 P_2$  belongs to  $S^{-\delta_0 + m}(\nu, \mu, \chi)$  and

$$\sigma(P_1 P_2)(x_1, y, \xi, \eta) = \sigma(p_1(x_1, y, \xi, D_y) p_2(x_1, y, \xi, D_y))$$

belongs to  $S^{-\delta_0}(\nu, \mu, \chi)$ , where  $\delta_0 = \min(\ell_1, \ell_2) - \sigma_1$ .

(ii) If  $P$  belongs to  $S^0(\nu, \mu, \chi)$ , then  $P$  is a bounded operator in  $L^2(\mathbb{R}^3)$

(iii)  $P \in S^m(\nu, \mu, \chi)$  has pseudo-local property, i.e. For any  $\varphi, \psi \in C^\infty(\mathbb{R}^3)$

$P$  is a smoothing operator when  $\text{supp } \varphi \cap \text{supp } \psi = \emptyset$ .

The main result of this section is the proposition below.

Proposition 1. Under condition 1 and condition 2 there exist a neighbourhood  $\Omega' \subset \mathbb{R}^2$  of  $x_1 = y = 0$  and  $\tilde{A}(x_1, y, \xi, \eta) \in S^m(\nu, \mu, \chi)$  which satisfy the following properties.

(i) We can construct a left parametrix  $Q \in S^{-m}(\nu, \mu, \chi)$  for  $\tilde{A}$ , i.e.

$$Q \tilde{A} = I + W, \quad \text{where } W \text{ is a smoothing operator.}$$

$$(ii) (\tilde{A} - Q)(x_1, y, \xi, \eta) = 0 \quad \text{if } (x_1, y) \in \Omega'.$$

By this proposition and lemma 1 one can prove theorem A, noting that  $A_\tau$  belongs to  $S^1(\nu, \mu, \chi)$  and that  $Q$  is elliptic for  $|x_1| + |y| \neq 0$ , i.e. The symbol  $q(x_1, y, \xi, \eta)$  of  $Q$  satisfies  $|q| \geq c(|\xi| + |\eta| + 1)^{-m}$  for  $|x_1| + |y| \neq 0$ .

We need several steps to show proposition 1.

Lemma 2. For all  $\alpha$  and  $\beta$  we have

$$|\partial_y^\alpha \partial_{\bar{y}}^\beta A_0(x_1, y, \xi, \eta)| \leq c_{\alpha, \beta} (\nu + \mu)^{m-|\alpha|} \mu^{|\beta|} \quad \text{for } |\xi| \geq c > 0$$

Moreover if we fix a  $C_0^\infty(\mathbb{R}^1)$ -function  $\varphi$ , then  $\varphi(|x_1|^2 + |y|^2)A_0(x_1, y, \xi, \eta)$  belongs to  $S^m(\nu, \mu, \chi)$  and  $\varphi(|x_1|^2 + |y|^2)(A - A_0)(x_1, y, \xi, \eta)$  satisfies (3) for  $c_{\alpha, \beta} h(x_1, y)^{\varepsilon_1}$  ( $\varepsilon_1 > 0$ ) instead of the constants  $c_{\alpha, \beta}$  in (3).

Lemma 3. If condition 1 hold, then we get for some constant  $c > 0$

$$c^{-1} |A_0(x_1, y, \xi, \eta)| \leq \psi(x_1, y, \xi, \eta) \leq c |A_0(x_1, y, \xi, \eta)| .$$

Lemma 4. (Grushin [2]). We find a constant  $c_1 > 0$  such that

$$\|u\| \leq c_1 \|A_0(x_1, y, \xi, D_y)u\| \quad \forall u \in \mathcal{S}(\mathbb{R}^1)$$

for any  $\xi$  when  $|\xi|=1$ .

Set  $\lambda_z(y, \eta)$  with parameters  $z = (x_1, \xi)$  by

$$\lambda_z(y, \eta) = (|A_0(x_1, y, \xi, \eta)|^2 + 1)^{1/2m}$$

then by lemma 2 and lemma 3, we get

Lemma 5. If  $|\xi|=1$ , then we get

- (i)  $\lambda_z(y, \eta)$  is a basic weight function which holds (5) and (6) for  $A_{\alpha, \beta}$  and  $A$  independant of parameters  $z$ .
- (ii)  $|A_0(x_1, y, \xi, \eta)|^2 + 1 \geq \lambda_z(y, \eta)^{2m}$
- (iii)  $|\partial_y^\alpha \partial_{\bar{y}}^\beta A_0(x_1, y, \xi, \eta)| \leq c_{\alpha, \beta} \lambda_z(y, \xi)^{m-|\alpha|}$

where  $c_{\alpha, \beta}$  are independant of  $z$ .

3

Now, by lemma 5 we can apply theorem 1 for  $L_z = L_{x_1, \xi}$  ( $|\xi| = 1$ )

defined by

$$L_z = L_{x_1, \xi} = \frac{\partial}{\partial t} + p(x_1, y, \xi, D_y),$$

where  $p(x_1, y, \xi, D_y) = A_0(x_1, y, \xi, D_y)$ ,  $A_0^*(x_1, y, \xi, D_y)$  and  $A_0^*(x_1, y, \xi, D_y)$  is the adjoint operator of  $A(x_1, y, \xi, D_y)$ .

Let  $e(t; y, D_y; z) \in S_{\lambda_z, 1, 0}^0$  be the fundamental solution for  $L_z$  with parameters  $z$ . ( $|\xi| = 1$ ).

For any  $\xi$  ( $|\xi| = 1$ ) we get

Lemma 6. If condition 1 and condition 2 hold, then there exists the fundamental solution  $u(t; y, D_y; z)$  for  $L_z$  which admits the expansion below for  $N \geq 2m$ ,

$$u(t; y, \eta; z) = \sum_{j=0}^{N-1} u_j(t; y, \eta; z) + v_N(t; y, \eta; z)$$

$$|\partial_\eta^\alpha \partial_y^\beta u_j(t; y, \eta; z)| \leq c_{j, \alpha, \beta} (\nu + \mu)^{-j-k_1} \mu^{j+|\beta|} \exp[-c_0(\nu+\mu)^{2m}t]$$

$$|\partial_\eta^\alpha \partial_y^\beta v_N(t; y, \eta; z)| \leq c_{N, \alpha, \beta} (\nu + \mu)^{-N-k_1} \mu^{N+|\beta|},$$

$$(9) \quad |\partial_\eta^\alpha \partial_y^\beta u(t; y, \eta; z)| \leq c'_{\alpha, \beta} (\nu + \mu)^{-k-k_1} \mu^{k+|\beta|} \exp[-c_0 \mu^{2m}t]$$

for  $\mu^m t \geq \varepsilon > 0$  and all  $k$ .

Proof. For  $|\xi| = 1$  by lemma 4 and theorem 2, one can find a constant  $C$  independent of  $z$  such that

$$\max_{|\alpha|+|\beta|+|\gamma| \leq N, y \in R^1, \eta \in R^1} |y^\alpha \eta^\beta D_y^\beta e(t+\varepsilon; y, \eta; z)| \leq C \exp[-c_2 t] \quad (t \geq 0)$$

for any  $\varepsilon > 0$ ,  $\eta$  and  $c_2 < c_1$ .

$A_0(x_1, y, \xi, \eta)$  is quasihomogeneous in the sense

$$A_0(\lambda^{-\sigma_1}x_1, \lambda^{-1}y, \lambda^{\tau_1}\xi_1, \lambda^{\tau_2}\xi_2, \lambda\eta) = \lambda^m A_0(x_1, y, \xi_1, \xi_2, \eta)$$

then  $u(t; y, \eta; z)$  is given by

$$(10) \quad u(t; y, \eta; x_1, \xi_1, \xi_2) = e(\tilde{\mu}^{2m}t; \tilde{\mu}y, \tilde{\mu}^{-1}\eta; \tilde{\mu}^{\sigma_1}x_1, \tilde{\mu}^{-\tau_1}\xi_1, \tilde{\mu}^{-\tau_2}\xi_2)$$

where  $\tilde{\mu} = \tilde{\mu}(\xi)$  is the positive root of the equation  $\sum_{j=1}^2 \tilde{\mu}^{-2\tau_j} \xi_j^2 = 1$ .

By (10) and theorem 1 we get the assertion.

$$\text{Put } r(x_1, y, \xi, \eta) = r(y, \eta; x_1, \xi) = \int_0^\infty u(t; y, \eta; x_1, \xi) dt \quad \text{for } |\xi| \geq 1.$$

Then  $R(x_1, \xi) = r(y, D_y; x_1, \xi)$  is a left and right inverse of

$p(x_1, y, \xi, D_y)$ . Let us define a pseudo-differential operator  $K(x_1, \xi)$

with parameters by

$$K(x_1, \xi) = R(x_1, \xi) A_0(x_1, y, \xi, D_y)$$

Then for  $|\xi| \geq 1$ ,

Lemma 7.  $K(x_1, \xi)$  is a left inverse of  $A_0(x_1, y, \xi, D_y)$  with a symbol  $k(y, \eta; x_1, \xi) = k(x_1, y, \xi, \eta)$  which admits for any  $\alpha$  and  $\beta$

$$|\partial_\eta^\alpha \partial_y^\beta k(y, \eta; x_1, \xi)| \leq C_{\alpha, \beta} (\nu + \mu)^{-m - |\alpha|} \mu^{|\beta|}.$$

Moreover  $\mathcal{G}(|x_1|^2 + |y|^2) k(x_1, y, \xi, \eta)$  belongs to  $S^{-m}(\nu, \mu, \chi)$  for any  $\mathcal{G} \in C_0^\infty(\mathbb{R}^1)$ .

Proof. It is sufficient to show that  $r(y, \eta; x_1, \xi)$  satisfies

$$|\partial_\eta^\alpha \partial_y^\beta r(y, \eta; x_1, \xi)| \leq C'_{\alpha, \beta} (\nu + \mu)^{-2m - |\alpha|} \mu^{|\beta|}$$

and that  $\mathcal{G}(|x_1|^2 + |y|^2) r(x_1, y, \xi, \eta)$  belongs to  $S^{-2m}(\nu, \mu, \chi)$ , by lemma 2.

We write

$$\begin{aligned} r(y, \eta; x_1, \xi) &= \int_0^{\mu^m(\xi)} u(t; y, \eta; x_1, \xi) dt + \int_{\mu^m(\xi)}^{\infty} u(t; y, \eta; x_1, \xi) dt \\ &= I_1 + I_2. \end{aligned}$$

For  $I_1$  we fix  $N$  such that  $N \geq 2m$  and use the expansion in lemma 6.

We apply (9) taking  $k=2m$  for  $I_2$ . For derivatives with respect to parameters  $x_1$  and  $\xi$ , we can write for example

$$r_{\xi_j}(y, D_y; x_1, \xi) = -r(y, D_y; x_1, \xi) p_{\xi_j}(x_1, y, \xi, D_y) r(y, D_y; x_1, \xi)$$

Then, by lemma 2 and symbol calculus of pseudo-differential operator with parameters  $z=(x_1, \xi)$  and also noting that  $R(x_1, \xi)$  has pseudo-local property with respect to  $y$ , one get the assertion.

By lemma 2 we can construct  $\tilde{A}_0(x_1, y, \xi, \eta) \in S^m(\nu, \mu, \chi)$  such that  $|\tilde{A}_0(x_1, y, \xi, \eta)| \leq c \chi^m$  for  $|x_1| + |y| \geq 1$  and  $\tilde{A}_0(x_1, y, \xi, \eta) = A_0(x_1, y, \xi, \eta)$  if  $|x_1| + |y| \leq 1$ . Now let us construct a pseudo-differential operator  $Q_0 = a_0(x_1, y, D_{x_1}, D_{x_2}, D_y)$  which is a left parametrix for  $\tilde{A}_0(x_1, y, D_{x_1}, D_{x_2}, D_y)$  by using  $k(x_1, y, \xi, \eta)$ .

Put  $a'_0(x_1, y, \xi, \eta) = \varphi_1(|x_1|^2 + |y|^2) \varphi_2(|\xi|^2) k(x_1, y, \xi, \eta) + \varphi_1(|x_1|^2 + |y|^2) \varphi_1(|\xi|^2) \varphi_2(|\eta|^2) k_1(x_1, y, \xi, \eta)$ .

Here  $k_1(x_1, y, \xi, \eta) = A_0(x_1, y, \xi, \eta)^{-1}$ ,  $\varphi_1 \in C_0^\infty(\mathbb{R}^1)$  such that  $\varphi_1(t) = 1$  if  $|t| \leq 1$

$\varphi_1(t)=0$  if  $t \geq 2$  and  $\varphi_2=1-\varphi_1$ . It is clear that  $q'_0(x_1, y, \xi, \eta)$  belongs  $S^{-m}(\nu, \mu, \chi)$ .

$$(11) \quad q'_0(x_1, y, \xi, D_y) \tilde{A}_0(x_1, y, \xi, D_y) - I \in S^{-\delta'_0}(\nu, \mu, \chi)$$

where  $\delta'_0 = \min(\delta_0, 1) > 0$  using (i) of lemma 1.

From (11) one can get a left parametrix  $Q_0 \in S^{-m}(\nu, \mu, \chi)$ .

For any  $\varepsilon > 0$  there exist  $\Omega'$  and  $\tilde{A}(x_1, y, \xi, \eta) \in S^m(\nu, \mu, \chi)$  such that

$$(12) \quad \begin{aligned} \tilde{A}(x_1, y, \xi, \eta) &= A(x_1, y, \xi, \eta) && \text{if } (x_1, y) \in \Omega' \\ |(\tilde{A} - \tilde{A}_0)^{\alpha}_{\beta}(x_1, y, \xi, \eta)| &\leq \varepsilon (\nu + \mu)^{m-|\alpha|} \mu^{|\beta|} \chi^{-|\beta|} && \text{for } \alpha = (\alpha_1, \alpha_2, \alpha_3) \text{ and } \beta = (\beta_1, 0, \beta_3). \end{aligned}$$

If  $\varepsilon$  is sufficient small, then by (12) there exists  $R_0 \in S^0(\nu, \mu, \chi)$

the inverse of  $I + Q_0(\tilde{A} - \tilde{A}_0)$ . Set  $Q = R_0 Q_0$ , then  $Q$  is a required left parametrix.

#### § 4. Prooves of theorem B and theorem C.

At first we show theorem B.

Define a weight function  $\lambda(\xi, \eta)$  by

$$\lambda(\xi, \eta) = \varphi(\xi, \eta) \left( \sum_{j=1}^3 |\xi_j|^{1/\tau_j} + |\eta|^{1/\bar{\tau}} \right) + 1$$

where  $\varphi \in C^\infty(\mathbb{R}^3)$  such that  $\varphi(\zeta) = 1$  ( $|\zeta| \geq 1$ ),  $\varphi(\zeta) = 0$  ( $|\zeta| \leq 1/2$ ) and

$\bar{\tau} = \max(\tau_1, \tau_2)$ . Then by (4)<sub>0</sub> it is clear that

$$(13) \quad \|u\|_{m, \lambda} \leq C(\|Au\| + \|u\|) \quad \forall u \in C_0^\infty(\Omega).$$

?

It is easy to see that  $\tilde{A}(x_1, y, \xi, \eta)$  belongs to  $S_{\lambda, \beta, \delta}^m$  if  $\theta = (\tau_1, \tau_2, \bar{\tau})$  and  $\delta = (0, 0, 0)$ . Now from (13) we can apply theorem 3 in §1 for  $\ell=0$ , choosing  $\theta_j$  such that  $\theta_j = (\tau_j + \sigma_j)/2$  ( $j=1, 2$ ) and  $\theta_3 = 1$ .

Then for any  $N$

$$14) \quad \lambda(\xi, 0)^{2m} \|\psi\|^2 \leq c \left\{ \int \left| \sum_{|\alpha+\beta| \leq N} {}_A \binom{\alpha}{\beta} (x_1, y, \xi, 0) \lambda(\xi, 0) \right. \right. \\ \left. \left. \zeta^{\beta} D_\zeta^\alpha \psi(\zeta) / \alpha! \beta! \right|^2 d\zeta + \lambda(\xi, 0)^{2m \bar{\tau} - 2\epsilon_0 N + d_1} \sum_{|\alpha+\beta| \leq N+d_2} \|\zeta^{\beta} D_\zeta^\alpha \psi\|^2 \right\}$$

Now take  $N$  such that  $2m \bar{\tau} - 2\epsilon_0 N + d_1 = 2m + \epsilon_0$ . Note that (14) is true for  $\mu(\xi)$  instead of  $\lambda(\xi, 0)$  and put  $x_1 = t^{-\sigma_1} x_1^0, y = 0$  and  $\xi_j = t^{\tau_j} \xi_j^0$  ( $j=1, 2$ ) such that  $\mu(\xi^0) = 1$ . Then quasihomogeneity of  $\mu(\xi)$  and  ${}_A \binom{\alpha}{\beta} (x_1, y, \xi, 0)$  we get the following estimate

$$\|\psi\|^2 \leq c \left\{ \int \left| \sum_{|\alpha+\beta| \leq N} {}_{A_0} \binom{0, 0, \alpha}{0, 0, \beta} (x_1^0, 0, \xi^0, 0) \zeta^{\beta} D_\zeta^\alpha \psi / \alpha! \beta! \right|^2 d\zeta \right\} \\ + O(t^{-r})$$

where  $r = \min(\epsilon_1, (\tau_j - \sigma_j)/2)$ .

Note that  $\sum_{|\alpha+\beta| \leq N} {}_{A_0} \binom{0, 0, \alpha}{0, 0, \beta} (x_1^0, 0, \xi^0, 0) \zeta^{\beta} D_\zeta^\alpha \psi / \alpha! \beta! = A_0(x_1^0, \xi, \xi^0, D_\zeta) \psi$  and

quasihomogeneity of  $A_0(x_1, y, \xi, \eta)$  we get the assertion of theorem B.

To show theorem C we take  $\lambda'(\xi, \eta) = (\sum_{j=1}^2 |\xi_j|^2 + |\eta|^2 + 1)^{1/2}$ .

Then by (3)<sub>0</sub> and theorem 3 we get for  $(x_1, y) \in K$

$$\lambda(\xi, \eta)^m \leq c_K |A_0(x_1, y, \xi, \eta)| \quad \text{for } |\xi| + |\eta| \geq c > 0$$

By quasihomogeneity of  $A_0(x_1, y, \xi, \eta)$ , it is elliptic for  $|x_1| + |y| \neq 0$ .
