Abstract

In this note we consider the compact composition operator acting different weighted Bergman spaces of the unit ball of $\mathbb{C}^N$. We will give an estimate for the essential norm of the composition operator. As a corollary, we can characterize the compactness of this operator in terms of the boundary behavior of the symbol.

1 Introduction

For a fixed integer $N > 1$, let $\mathbb{C}^N$ denote the complex $N$-dimensional Euclidean space and $B$ denote the open unit ball of $\mathbb{C}^N$. For each $p$, $0 < p < \infty$ and $\alpha > -1$, the weighted Bergman space $A^p_{\alpha}(B)$ is the space of all holomorphic functions $f$ on $B$ for which

$$\|f\|^p_{\alpha} = \int_B |f(z)|^p(1-|z|^2)^\alpha dV(z) < \infty.$$ 

Here $dV$ denotes the normalized Lebesgue volume measure on $B$. When $1 \leq p < \infty$ the space $A^p_{\alpha}(B)$ is a Banach space. In particular, the space $A^2_{\alpha}(B)$ is a functional Hilbert space with inner product

$$\langle f, g \rangle_{\alpha} = \int_B f(z)\overline{g(z)}(1-|z|^2)^\alpha dV(z).$$

Since each point evaluation is a bounded linear functional, $A^2_{\alpha}(B)$ has the reproducing kernel function which is given by

$$K^\alpha_w(z) = \frac{c_{\alpha}}{(1-\langle z, w \rangle)^{\alpha+N+1}},$$

where $c_{\alpha} = 1/\int_B (1-|z|^2)^\alpha dV(z)$.

Let $\varphi$ be a holomorphic self-map of $B$, that is

$$\varphi = (\varphi_1, \ldots, \varphi_N) : B \to B,$$
where each $\varphi_j$ is a holomorphic function on $B$. Then $\varphi$ induces the composition operator $C_\varphi$, defined on the space of all holomorphic functions on $B$ by

$$C_\varphi f = f \circ \varphi.$$  

Many authors have studied these operators on various holomorphic function spaces. For these studies, see the monograph [3]. In this note, we discuss this operator on $A^p_\alpha(B)$. In the one variable case, Littlewood’s subordination principle shows that every holomorphic function $\varphi$ on the unit disk $\mathbb{D}$ with $\varphi(\mathbb{D}) \subset \mathbb{D}$ induces the bounded composition operator $C_\varphi$ on the weighted Bergman space $A^p_\alpha(\mathbb{D})$. Thus the concern with the compactness of $C_\varphi$ had been growing since the end of the last century. In 1986 B.D. MacCluer and J.H. Shapiro [5] gave a characterization for the symbol $\varphi$ which induces the compact composition operator on $A^p_\alpha(\mathbb{D})$ as follows.

**Theorem 1.** Let $0 < p < \infty$, $\alpha > -1$ and $\varphi$ be a holomorphic function on $\mathbb{D}$ with $\varphi(\mathbb{D}) \subset \mathbb{D}$. Then the composition operator $C_\varphi$ is the compact operator on $A^p_\alpha(\mathbb{D})$ if and only if $\varphi$ satisfies the condition

$$\lim_{|z| \to 1} \frac{1 - |z|^2}{1 - |\varphi(z)|^2} = 0. \quad (1)$$

By Julia-Carathéodory’s theorem we see that the above condition (1) is equivalent to $\varphi$ has no finite angular derivative at any point of the boundary of $\mathbb{D}$.

The several variables (unit ball) case have some difficulties on the property of the composition operator $C_\varphi$. For instance, there is a holomorphic self-map of $B$ such that the composition operator is not bounded on $A^p_\alpha(B)$. It is easy to construct the example. For the sake of the simplicity, we consider the case $N = 2$ and $p = 2$. We put $\varphi(z) = (2z_1z_2, 0)$ and consider the test function $f_k(z)$ defined by

$$f_k(z) = \sqrt{\frac{\Gamma(k + \alpha + 3)}{k!\Gamma(\alpha + 3)}} z_1^k \quad (z = (z_1, z_2) \in B),$$

for $k \geq 1$ positive integer. Then $\{f_k\}$ is bounded in $A^2_\alpha(B)$ with $\sup_{k \geq 1} \|f_k\|_\alpha = 1$ and

$$f_k(\varphi(z)) = \sqrt{\frac{\Gamma(k + \alpha + 3)}{k!\Gamma(\alpha + 3)}} 2^k z_1^k z_2^k.$$  

This implies that $\|C_\varphi f_k\|_\alpha \sim k^{\frac{1}{2}}$, and so $C_\varphi$ is not bounded on $A^2_\alpha(B)$. When we study on the compact composition operator in the case $N \geq 2$, hence, we will need some assumptions which verify the boundedness of $C_\varphi$. For an univalent holomorphic self-map of $B$, the following sufficient condition for the boundedness of $C_\varphi$ is known.

**Theorem 2.** Suppose that an univalent holomorphic self-map of $B$ which satisfies

$$\sup_{z \in B} \frac{\|\varphi'(z)\|^2}{|J_{\varphi}(z)|^2} < \infty. \quad (2)$$

Then $C_\varphi$ is bounded on $A^p_\alpha(B)$. 

However it is also known that the condition (2) is not a necessary condition for the boundedness of $C_{\varphi}$. See [3, p.247]. Hence many authors have tried to characterize the compactness of $C_{\varphi}$ on $A_{\alpha}^{p}(B)$ under some assumptions.

2 Well-Known Results

In [5], B.D. MacCluer and J.H. Shapiro also gave the following characterization.

**Theorem 3.** Suppose that $\varphi$ is an univalent holomorphic self-map of $B$ which satisfy the condition (2) in Theorem 2. Then $C_{\varphi}$ is compact on $A_{\alpha}^{p}(B)$ if and only if $\varphi$ has no finite angular derivative at any point of the boundary of $B$.

This result is the higher dimensional case of Theorem 1. D.D. Clahane [2] proved the following result.

**Theorem 4.** Let $p > 0$ and $\alpha \geq 0$. Suppose that $\varphi$ is a holomorphic self-map of $B$ such that $C_{\varphi}$ is bounded on $A_{\alpha}^{p}(B)$ and $\varphi$ satisfies the following condition

$$\lim_{|z| \to 1^{-}} \left( \frac{1-|z|^2}{1-|\varphi(z)|^2} \right)^{\alpha+2} \|\varphi'(z)\|^2 = 0.$$ 

Then $C_{\varphi}$ is compact on $A_{\beta}^{p}(B)$ for all $\beta \geq \alpha$.

Clahane’s result does not require the assumption $\varphi$ is univalent but the relation between the compactness of $C_{\varphi}$ and the boundary behavior of $\varphi$ became unclear. Furthermore the spaces $A_{\alpha}^{p}(B)$ is restricted to the case $\alpha \geq 0$.

Recently, K. Zhu [8] have given the following characterization.

**Theorem 5.** Let $p > 0$ and $\alpha > -1$. Suppose that $C_{\varphi}$ is bounded on $A_{\beta}^{q}(B)$ for some $q > 0$ and $-1 < \beta < \alpha$. Then $C_{\varphi}$ is compact on $A_{\alpha}^{p}(B)$ if and only if $\varphi$ satisfies

$$\lim_{|z| \to 1^{-}} \frac{1-|z|^2}{1-|\varphi(z)|^2} = 0.$$ 

Note that Julia-Carathéodory’s theorem for the unit ball case implies that the above condition is equivalent to $\varphi$ has no finite angular derivative at any point of the boundary of $B$. Zhu’s result does not also require the univalency of $\varphi$. Since he gave the characterization for the compactness of $C_{\varphi}$ in terms of the angular derivative condition, we can consider that this result is the improved version of Theorem 3 or the higher dimensional case of Theorem 1.

In Theorem 3, Theorem 4 or Theorem 5, their results need some hypotheses on the symbol $\varphi$. The reason to need these assumptions on $\varphi$ seems to be a technical request in their proof. Since every holomorphic self-map $\varphi$ of $B$ does not induce the bounded composition operator on $A_{\alpha}^{p}(B)$, the assumption that $C_{\varphi}$ is bounded on $A_{\alpha}^{p}(B)$ is very natural condition for the unit ball case.
3 Main Result

Under the condition $C_\varphi$ is bounded on $A_\alpha^p(B)$, we will consider the compactness problem. Recall that the essential norm of the bounded operator on Banach spaces. Let $X$ and $Y$ be Banach spaces. For a bounded operator $T : X \to Y$, the essential norm $\|T\|_{e,X \to Y}$ of $T$ is defined to be the distance from $T$ to the set of compact operators, namely $\|T\|_{e,X \to Y}$ is defined by

$$\|T\|_{e,X \to Y} = \inf \{|T - K| : K \text{ is compact from } X \text{ to } Y\}.$$ 

Here $\|\|$ denotes the usual operator norm. By this definition, we see that $T : X \to Y$ is a compact operator if and only if $\|T\|_{e,X \to Y} = 0$. Thus the essential norm is closely related to the compactness problem of concrete operators. In Theorem 3, Theorem 4 and Theorem 5, they have not mentioned the essential norm of $C_\varphi$. In this note we give an estimate for the essential norm of $C_\varphi : A_\alpha^2(B) \to A_\beta^2(B) \ (-1 < \alpha \leq \beta)$.

**Theorem 6.** Let $\alpha > -1$ and $\beta \geq \alpha$. Suppose that $\varphi$ is a holomorphic self-map of $B$ such that $C_\varphi : A_\alpha^2(B) \to A_\beta^2(B)$ is bounded. Then the essential norm of $C_\varphi$ is comparable to

$$\limsup_{|z| \to 1^-} \frac{(1 - |z|^2)^{\beta+N+1}}{(1 - |\varphi(z)|^2)^{\alpha+N+1}}.$$ 

So $C_\varphi : A_\alpha^2(B) \to A_\beta^2(B)$ is compact if and only if $\varphi$ satisfies

$$\lim_{|z| \to 1^-} \frac{(1 - |z|^2)^{\beta+N+1}}{(1 - |\varphi(z)|^2)^{\alpha+N+1}} = 0.$$ 

In the previous our works [6, 7], we have the following characterization for the boundedness and compactness of $C_\varphi : A_\alpha^p(B) \to A_\beta^p(B)$.

**Theorem 7.** Let $0 < p < \infty$ and $-1 < \alpha, \beta < \infty$. Suppose that $\varphi$ is a holomorphic self-map of $B$. Then the following conditions are equivalent.

(a) $C_\varphi : A_\alpha^p(B) \to A_\beta^p(B)$ is a bounded operator,

(b) $\varphi$ satisfies the condition

$$\sup_{z \in B} \int_B \left\{ \frac{1 - |z|^2}{|1 - \langle\varphi(w), z\rangle|^2} \right\}^{\alpha+N+1} dV_\beta(w) < \infty.$$ 

Here $dV_\beta$ denotes the weighted measure $dV_\beta(w) = (1 - |w|^2)^\beta dV(w)$. Moreover,

(c) $C_\varphi : A_\alpha^p(B) \to A_\beta^p(B)$ is a compact operator,

(d) $\varphi$ satisfies the condition

$$\sup_{|z| \to 1^-} \int_B \left\{ \frac{1 - |z|^2}{|1 - \langle\varphi(w), z\rangle|^2} \right\}^{\alpha+N+1} dV_\beta(w) = 0.$$
This theorem shows the following result.

**Corollary 1.** The boundedness and compactness of the composition operator $C_\varphi : A_\alpha^p(B) \rightarrow A_\beta^p(B)$ are independent of the exponent $p$.

Combining Theorem 6 with Corollary 1, we have the following characterization.

**Corollary 2.** Let $0 < p < \infty$ and $-1 < \alpha \leq \beta$. Suppose that $\varphi$ is a holomorphic self-map of $B$ which induces the bounded composition operator $C_\varphi : A_\alpha^p(B) \rightarrow A_\beta^p(B)$. Then $C_\varphi : A_\alpha^p(B) \rightarrow A_\beta^p(B)$ is compact if and only if

$$\lim_{|z| \rightarrow 1^-} \frac{(1 - |z|^2)^{\beta+N+1}}{(1 - |\varphi(z)|^2)^{\alpha+N+1}} = 0.$$ 

According to the result due to J.A. Cima and P.R. Mercer [1], every holomorphic self-map $\varphi$ of $B$ induces the bounded composition operator $C_\varphi : A_\alpha^p(B) \rightarrow A_{\alpha+N-1}^p(B)$. Hence it would be very interesting to know the compactness criteria for this situation. Indeed, H. Koo has proposed the following problem in [4].

Charaterize the compactness of the composition operator

$$C_\varphi : A_\alpha^p(B) \rightarrow A_{\alpha+N-1}^p(B).$$

Since we see that $\alpha + N - 1 > \alpha$ for $\alpha > -1$, this situation suits the assumption in Theorem 6. Thus we can give an answer to Koo's question as follows.

**Corollary 3.** Let $\alpha > -1$, $0 < p < \infty$ and $\varphi$ be a holomorphic self-map of $B$. Then $C_\varphi : A_\alpha^p(B) \rightarrow A_{\alpha+N-1}^p(B)$ is compact if and only if $\varphi$ satisfies

$$\lim_{|z| \rightarrow 1^-} \frac{(1 - |z|^2)^{\alpha+2N}}{(1 - |\varphi(z)|^2)^{\alpha+N+1}} = 0.$$
