RICCI CURVATURE AND CONVERGENCE OF LIPSCHITZ FUNCTIONS

SHOUEI HONDA

Abstract

We give the definition of a convergence of the differentials of Lipschitz functions with respect to the measured Gromov-Hausdorff topology, and several properties of the convergence.

1 Introduction

Let \( \{(M_i, m_i)\}_{i \in \mathbb{N}} \) be a sequence of pointed \( n \)-dimensional complete Riemannian manifolds \( (n \geq 2) \) with \( \text{Ric}_{M_i} \geq -(n-1) \), and \( (Y, y, \nu) \) a pointed proper metric space (i.e. every bounded subset of \( Y \) is relatively compact) with a Radon measure \( \nu \) on \( Y \) satisfying that \( (M_i, m_i, \text{vol}) \) converges to \( (Y, y, \nu) \) with respect to the measured Gromov-Hausdorff topology. Here \( \text{vol} \) is the renormalized Riemannian volume of \( (M_i, m_i) \): \( \text{vol} = \text{vol}/\text{vol} B_1(m_i) \). Fix \( R > 0 \), a sequence \( \{f_i\}_{1 \leq i < \infty} \) of Lipschitz functions \( f_i \) on \( B_R(m_i) = \{ w \in M_i; w, m_i < R \} \), and a Lipschitz function \( f_\infty \) on \( B_R(y) \) with \( \sup_i \text{Lip} f_i < \infty \). Here \( w, m_i \) is the distance between \( w \) and \( m_i \), \( \text{Lip} f_i \) is the Lipschitz constant of \( f_i \). Then we say that \( f_i \) converges to \( f_\infty \) on \( B_R(y) \) if \( f_i(x_i) \to f_\infty(x_\infty) \) for every \( x_i \in B_R(m_i) \) and every \( x_\infty \in B_R(y) \) satisfying that \( x_i \) converges to \( x_\infty \). See section 2 for these precise definitions. Assume that \( f_i \) converges to \( f_\infty \) on \( B_R(y) \), below.

The purpose of this paper is to give a definition: the differentials \( df_i \) of \( f_i \) converges to the differential \( df_\infty \) of \( f_\infty \) in this setting. In order to give the definition below, we shall recall celebrated works on limit spaces of Riemannian manifolds by Cheeger-Colding. By [1] and [6], it is known that the cotangent bundle \( T^*Y \) of \( Y \) exists. We remark that each fiber \( T^*_wY \) is a finite dimensional real vector space with canonical inner product \( \langle \cdot, \cdot \rangle(w) \).

Key words and phrases. Gromov-Hausdorff convergence, geometric measure theory, Ricci curvature, Lipschitz functions, harmonic functions.
for a.e. \( w \in Y \), and that every Lipschitz function \( g \) on \( B_R(y) \) has the canonical differential section: \( dg(w) \in T_wY \) for a.e. \( w \in B_R(y) \). See section 4 in [1], and section 6 in [6] for the details.

We shall give the definition of a convergence of the differentials of Lipschitz functions (see Definition 4.15):

**Definition 1.1 (Convergence of the differentials of Lipschitz functions).** We say that \( df_i \) converges to \( df_\infty \) on \( B_R(y) \) if for every \( \epsilon > 0 \), every \( x_\infty \in B_R(y) \), every \( z_\infty \in Y \), every sequence \( \{x_i\}_{1 \leq i < \infty} \) of points \( x_i \in B_R(m_i) \) satisfying that \( x_i \) converges to \( x_\infty \), and every sequence \( \{z_i\}_{1 \leq i < \infty} \) of points \( z_i \in M_i \) satisfying that \( z_i \) converges to \( z_\infty \), there exists \( r > 0 \) such that

\[
\limsup_{i \to \infty} \left| \frac{1}{\vol B_t(x_i)} \int_{B_t(x_i)} \langle df_i, d\nu \rangle - \frac{1}{\nu(B_t(x_\infty))} \int_{B_t(x_\infty)} \langle df_\infty, d\nu \rangle \right| < \epsilon
\]

and

\[
\limsup_{i \to \infty} \left| \frac{1}{\vol B_t(x_i)} \int_{B_t(x_i)} |df_i|^2 d\nu \right| \leq \frac{1}{\nu(B_t(x_\infty))} \int_{B_t(x_\infty)} |df_\infty|^2 d\nu + \epsilon
\]

for every \( 0 < t < r \). Here \( r_{z_i} \) is the distance function from \( z_i \): \( r_{z_i}(w) = \frac{z_i - w}{\|z_i - w\|} \).

Roughly speaking, this convergence: \( df_i \to df_\infty \), implies “\( H_{1,2} \) (or \( H_{1,p} \))-convergence with respect to the measured Gromov-Hausdorff topology”. See Theorem 1.2 and Remark 4.23. If \( df_i \) converges to \( df_\infty \) on \( B_R(y) \), then we denote it by \((f_i, df_i) \to (f_\infty, df_\infty)\) on \( B_R(y) \). Assume \((f_i, df_i) \to (f_\infty, df_\infty)\) and \((g_i, dg_i) \to (g_\infty, dg_\infty)\) on \( B_R(y) \) below.

In the paper, we will study several properties of the convergence and give their applications. For example, we will show the following in section 4:

**Theorem 1.2.** Let \( \{F_i\}_{1 \leq i \leq \infty} \) be a sequence of continuous functions on \( \mathbb{R} \). Assume that \( F_i \) converges to \( F_\infty \) with respect to the compact uniformly topology. Then, we have

\[
\lim_{i \to \infty} \int_{B_R(m_i)} F_i(|df_i - dg_i|) d\nu = \int_{B_R(y)} F_\infty(|df_\infty - dg_\infty|) d\nu.
\]

Especially, if \( f_\infty = g_\infty \), then

\[
\lim_{i \to \infty} \int_{B_R(m_i)} F_i(|df_i - dg_i|) d\nu = F_\infty(0) \nu(B_R(y)).
\]

See Corollary 4.20 for the proof. We will also show the following in section 4:

**Theorem 1.3.** Let \( \{h_i\}_{1 \leq i < \infty} \) be a sequence of harmonic functions \( h_i \) on \( B_R(m_i) \), and \( h_\infty \) a Lipschitz function on \( B_R(y) \). Assume that \( \sup \\text{Lip} h_i < \infty \) and that \( h_i \) converges to \( h_\infty \) on \( B_R(y) \). Then we have \((h_i, dh_i) \to (h_\infty, dh_\infty)\) on \( B_R(y) \).
We remark that in Theorem 1.3, $h_\infty$ is a harmonic function on $B_R(y)$, proved in [11] by Ding. We will give an alternative proof of it in section 4. See Corollary 4.34.

The organization of this paper is as follows:

In the next section, we will recall several important notions and properties of metric spaces, Riemannian manifolds and their limit spaces. Most of statements in section 2 do not have the proof, we will give a reference for them only.

In section 3, we will show several results about rectifiability of limit spaces of Riemannian manifolds. See Theorem 3.16 and Theorem 3.49. It is important that their functions in these theorems which give a rectifiability of limit spaces, are distance functions. As a corollary of them, we will give an explicit geometric formula for the radial derivative of Lipschitz functions from a given point. See Theorem 3.30. These results are used in section 4 essentially.

In section 4, we will give two definitions of pointwise convergence of $L^\infty$-functions with respect to the measured Gromov-Hausdorff topology, and give the definition of a convergence of the differentials of Lipschitz functions again via the definitions of convergence of $L^\infty$-functions. We will also give several properties of the convergence. The main properties are Theorem 4.17, Theorem 4.24 and Corollary 4.32.

Finally, we shall introduce several applications of this paper. In [24], we will give an application of this section 4 to a study of harmonic functions with polynomial growth on asymptotic cones of non-negatively Ricci curved manifolds having Euclidean volume growth. For example, we will show that a space of harmonic functions on asymptotic cones with polynomial growth of a fixed rate is a finite dimensional vector space. We can regard it as asymptotic cones version of the conjecture [9, Conjecture 0.1] by Yau. Moreover, in [24], we will give “Laplacian comparison theorems on limit spaces of Riemannian manifolds” by using several results given in section 4, and show a stability of lower bounds on Ricci curvature with respect to the Gromov-Hausdorff topology as a corollary of them. In [25], we will also give a geometric application by using several results in this section 4, to limit spaces of Riemannian manifolds with Ricci curvature bounded below.

Acknowledgments. The author would like to express his deep gratitude to Professor Kenji Fukaya and Professor Tobias Holck Colding for warm encouragement and their numerous suggestions and advice. He is grateful to Professor Takashi Shioya for giving many valuable suggestions. He wishes to thank the referees for valuable suggestions, comments and for pointing out a valuable reference [27]. This work was done during the stay at MIT, he also thanks to them and all members of Informal Geometry Seminar in MIT for warm hospitality and for giving nice environment. He was supported by Grant-in-Aid for Research Activity Start-up 22840027 from JSPS. He was also supported by GCOE ‘Fostering top leaders in mathematics’, Kyoto University.
2 Background

Our aim in this section is to give several notation, important notions and properties for metric measure spaces and manifolds. For a positive number \( \epsilon > 0 \) and real numbers \( a, b \), we use the following notations:

\[
a = b \pm \epsilon \iff |a - b| < \epsilon.
\]

We denote by \( \Psi(\epsilon_1, \epsilon_2, \ldots, \epsilon_k; c_1, c_2, \ldots, c_l) \) (more simply, \( \Psi \)) some positive function on \( \mathbb{R}^k_+ \times \mathbb{R}^l \) satisfying

\[
\lim_{\epsilon_1, \epsilon_2, \ldots, \epsilon_k \to 0} \Psi(\epsilon_1, \epsilon_2, \ldots, \epsilon_k; c_1, c_2, \ldots, c_l) = 0
\]

for each fixed real numbers \( c_1, c_2, \ldots, c_l \). We often denote by \( C(c_1, c_2, \ldots, c_l) \) some positive constant depending only on fixed real numbers \( c_1, c_2, \ldots, c_l \).

2.1 Metric measure spaces

For a metric space \( Z \), a point \( z \in Z \) and positive numbers \( r, R \) with \( r < R \), we use the following notations: \( B_r(z) = \{ x \in Z; \overline{z,x} < r \} \), \( \overline{B_r(z)} = \{ x \in Z; \overline{z,x} \leq r \} \), \( \partial B_r(z) = \{ x \in Z; \overline{z,x} = r \} \). Here \( \overline{y,x} \) is the distance between \( y \) and \( x \), we often denote the distance by \( d_Z(y, x) \). For every subset \( A \) of \( Z \), we also put \( B_r(A) = \{ x \in Z; \overline{A,x} < r \} \) and \( \overline{B_r(A)} = \{ x \in Z; \overline{A,x} \leq r \} \). For \( z \in Z \), we define an 1-Lipschitz function \( r_z \) on \( Z \) by \( r_z(w) = \overline{z,w} \). For a Lipschitz function \( f \) on \( Z \) and a point \( z \in Z \) which is not isolated in \( Z \), we put

\[
lip f(z) = \liminf_{r \to 0} \left( \sup_{x \in B_r(z) \setminus \{ z \}} \frac{|f(x) - f(z)|}{\overline{x,z}} \right), \quad Lip f(z) = \limsup_{r \to 0} \left( \sup_{x \in B_r(z) \setminus \{ z \}} \frac{|f(x) - f(z)|}{\overline{x,z}} \right).
\]

If \( z \) is an isolated point in \( Z \), then we put \( lip f(z) = Lip f(z) = 0 \). We also denote the Lipschitz constant of \( f \) by \( Lip f \). We remark that for every subset \( A \) of \( Z \) and every Lipschitz function \( f \) on \( A \), there exists a Lipschitz function \( f^* \) on \( Z \) such that \( f^*|_A = f \) and \( Lip f^* = Lip f \). See for instance (8.2) in [2].

We say that \( Z \) is proper if every bounded subset of \( Z \) is relatively compact. We also say that \( Z \) is a geodesic space if for every \( x_1, x_2 \in Z \), there exists an isometric embedding \( \gamma \) from \( [0, \overline{x_1,x_2}] \) to \( Z \) such that \( \gamma(0) = x_1, \gamma(\overline{x_1,x_2}) = x_2 \). \( \gamma \) is called a minimal geodesic from \( x_1 \) to \( x_2 \). For a proper geodesic space \( W \) and a point \( w \) in \( W \), we put \( C_w = \{ z \in W; \overline{w,z} + \overline{w,x} > \overline{w,x} \text{ for every } x \in W \setminus \{ z \} \} \) (if \( W \) is a single point, then we put \( C_w = \emptyset \)), and call it the cut locus of \( W \) at \( w \).

For a proper metric space \( Z \) and a Radon measure \( \nu \) on \( Z \), we say that the pair \( (Z, \nu) \) is a metric measure space in this paper. For a metric measure space \( (Z, \nu) \), a point \( z \) in
Z and a nonnegative integer k, we say that \( v \) is Ahlfors k-regular at \( z \) if there exist \( r > 0 \) and \( C \geq 1 \) such that \( C^{-1} \leq v(B_t(z))/t^k \leq C \) for every \( 0 < t < r \). We shall introduce the notion of \( v \)-rectifiability for metric measure spaces by Cheeger-Colding. See [6, Definition 5.3] and [6, Theorem 5.7]. For metric spaces \( X_1, X_2 \), a positive number \( \delta \) with \( \delta < 1 \), and a bijection map \( f \) from \( X_1 \) to \( X_2 \), we say that \( f \) is \( (1+\delta)\)-bi-Lipschitz to \( X_2 \) if \( f \) and \( f^{-1} \) are \( (1+\delta)\)-Lipschitz maps.

**Definition 2.1** (Rectifiability for a Borel subset of metric measure spaces). For a metric measure space \( (Z,v) \) and a Borel subset \( A \) of \( Z \), we say that \( A \) is \( v \)-rectifiable if there exist a positive integer \( m \), a collection of Borel subsets \( \{C_{k,i}\}_{1 \leq k \leq m, i \in \mathbb{N}} \) of \( A \), and a collection of bi-Lipschitz embedding maps \( \{\phi_{k,i}: C_{k,i} \to \mathbb{R}^k\}_{k,i} \) such that the following properties hold:

1. \( v(A \setminus \bigcup_{k,i} C_{k,i}) = 0 \)
2. \( v \) is Ahlfors k-regular at each \( x \in C_{k,i} \).
3. For every \( k, x \in \bigcup_{i \in \mathbb{N}} C_{k,i} \) and every \( 0 < \delta < 1 \), there exists \( C_{k,i} \) such that \( x \in C_{k,i} \) and that the map \( \phi_{k,i} \) is \((1+\delta)\)-bi-Lipschitz to the image \( \phi_{k,i}(C_{k,i}) \).

**Remark 2.2.** The third \((1+\delta)\)-bi-Lipschitz condition in the above definition is important. Actually, the existence of the canonical inner product of the cotangent bundle of Ricci limit spaces follows from this property. See condition \( iii \) of page 60 of [6] and section 6 in [6].

### 2.2 Gromov-Hausdorff convergence

For compact metric spaces \( X_1, X_2 \), we denote the Gromov-Hausdorff distance between \( X_1 \) and \( X_2 \) by \( d_{GH}(X_1, X_2) \). See [17] for the definition. On the other hand, for compact metric spaces \( X_1, X_2 \), a positive number \( \epsilon > 0 \) and a map \( \phi \) from \( X_1 \) to \( X_2 \), we say that \( \phi \) is an \( \epsilon \)-Gromov-Hausdorff approximation if \( X_2 = B_r(\text{Image} \phi) \) and \( |x,\bar{y} - \phi(x),\phi(y)| < \epsilon \) for every \( x, y \in X_1 \). For a sequence of compact metric spaces \( \{X_i\}_{1 \leq i \leq \infty} \), we say that \( X_i \) converges to \( X_\infty \) if \( d_{GH}(X_i, X_\infty) \) converges to 0. Then we denote it by \( X_i \to X_\infty \). Similarly, for pointed compact metric spaces \( (X_1, x_1), (X_2, x_2) \), we can define the pointed Gromov-Hausdorff distance \( d_{GH}((X_1, x_1), (X_2, x_2)) \). Moreover, for a sequence of pointed proper geodesic spaces \( \{(Z_i, z_i)\}_{1 \leq i \leq \infty} \), we say that \( (Z_i, z_i) \) converges to \( (Z_\infty, z_\infty) \) if there exist sequences \( \{\epsilon_i\}, \{R_i\} \) of positive numbers, and \( \{\phi_i\}_i \) of Borel maps \( \phi_i \) from \( (B_{R_i}(z_i), z_i) \) to \( (B_{R_i}(z_\infty), z_\infty) \) such that \( \epsilon_i \to 0, R_i \to \infty \) as \( i \to \infty \), \( B_{R_i}(z_\infty) \subset B_{\epsilon_i}(\text{Image} \phi_i) \), and \( |\alpha - \phi_i(\alpha), \phi_i(\beta)| \leq \epsilon_i \) for every \( \alpha, \beta \in B_{R_i}(x_i) \). We denote it by \( (Z_i, z_i) \xrightarrow{\phi_i, R_i} (Z_\infty, z_\infty) \), or more simply, \( (Z_i, z_i) \to (Z_\infty, z_\infty) \). It is easy to check that \( (Z_i, z_i) \to (Z_\infty, z_\infty) \) if and
only if $d_{GH}((B_R(z_i), z_i), (B_R(z_\infty), z_\infty)) \to 0$ for every $R > 0$. For a sequence $\{x_i\}_{1 \leq i \leq \infty}$ of points $x_i \in Z_i$, we say that $x_i$ converges to $x_\infty$ if $x_i \in B_{R_i}(z_i)$ and $\phi_i(x_i), x_\infty \to 0$. Then, we denote it by $x_i \to x_\infty$.

Let $(Z_i, z_i) \to (Z_\infty, z_\infty)$. For a sequence $\{A_i\}_{1 \leq i \leq \infty}$ of subsets $A_i$ of $Z_i$ with $\sup_i \bar{A}_i < \infty$, we say that $A_i$ is included by $A_\infty$ asymptotically if for every $\epsilon > 0$, there exists $i_0$ such that $\phi_i(A_i) \subset B_\epsilon(A_\infty)$ for every $i \geq i_0$. Then we denote it by $\limsup_{i \to \infty} A_i \subset A_\infty$ (if $A_\infty = \emptyset$, then $\limsup_{i \to \infty} A_i \subset A_\infty$ implies $A_i = \emptyset$ for every sufficiently large $i$).

Similarly, we also say that $A_\infty$ is included by $A_i$ asymptotically if for every $\epsilon > 0$, there exists $i_0$ such that $A_i \subset B_\epsilon(\phi_i(A))$ for every $i \geq i_0$. Then we denote it by $A_\infty \subset \liminf_{i \to \infty} A_i$. Let $C_\infty \subset \liminf_{i \to \infty} C_i$. For a sequence $\{f_i\}_{1 \leq i \leq \infty}$ of Lipschitz functions $f_i$ on $C_i$ with $\sup_i \text{Lip } f_i < \infty$, we say that $f_\infty$ is a restriction of $f_i$ asymptotically if $\lim_{i \to \infty} f_i(w_{n(i)}) = f_\infty(w)$ for every $w \in C_\infty$, every subsequence $\{n(i)\}$, of $N$, and every $w_{n(i)} \in C(n_i)$ with $\phi_{n(i)}(w_{n(i)}), w \to 0$. Let $\limsup_{i \to \infty} D_i \subset D_\infty$ and assume that $D_\infty$ is compact. For a sequence $\{g_i\}_{1 \leq i \leq \infty}$ of Lipschitz functions $g_i$ on $D_i$ with $\sup_i \text{Lip } g_i < \infty$, we say that $g_\infty$ is an extension of $g_i$ asymptotically if $\lim_{i \to \infty} g_i(w_{n(i)}) = g_\infty(w)$ for every $w \in D_\infty$, every subsequence $\{n(i)\}$, of $N$, and every $w_{n(i)} \in D(n_i)$ with $\phi_{n(i)}(w_{n(i)}), w \to 0$. For a sequence $\{K_i\}_{1 \leq i \leq \infty}$ of compact subsets $K_i$ of $Z_i$, we say that $(Z_i, z_i, K_i)$ converges to $(Z_\infty, z_\infty, K_\infty)$ if $\limsup_{i \to \infty} K_i \subset K_\infty$ and $K_\infty \subset \liminf_{i \to \infty} K_i$ hold. Then we denote it by $(Z_i, z_i, K_i) \overset{(\phi_i, \mathbf{R}, \epsilon)}{\to} (Z_\infty, z_\infty, K_\infty)$, or more simply, $(Z_i, z_i, K_i) \to (Z_\infty, z_\infty, K_\infty)$, or $K_i \to K_\infty$.

Let $(Z_i, z_i, K_i) \to (Z_\infty, z_\infty, K_\infty)$. For sequences $\{f_i\}_{1 \leq i \leq \infty}, \ldots, \{f_k\}_{1 \leq i \leq \infty}$ of Lipschitz functions $f_i$ on $K_i$ with $\sup_l (\text{Lip } f_i + |f_i|_{L_\infty}) < \infty$, we say that $(Z_i, z_i, K_i, f_i, \ldots, f_k)$ converges to $(Z_\infty, z_\infty, K_\infty, f_1, \ldots, f_k)$ if $f_\infty$ is an extension of $\{f_i\}$ asymptotically for every $l$. We denote it by $(Z_i, z_i, K_i, f_1, \ldots, f_k) \to (Z_\infty, z_\infty, K_\infty, f_1, \ldots, f_k)$, or more simply, $f_i \to f_k$ for every $l$. Then it is easy to check that $\lim_{i \to \infty} |f_i - f_k|_{L_\infty}(K_i) = 0$.

It is not difficult to check the following proposition:

**Proposition 2.3.** Let $\{(Z_i, z_i)\}_{1 \leq i \leq \infty}$ be a sequence of pointed proper geodesic spaces, $\Lambda$ a set and $\{A_\lambda\}_{\lambda \in \Lambda}$ a collection of bounded subsets of $Z_i$ for every $1 \leq i \leq \infty$. Assume that $(Z_i, z_i)$ converges to $(Z_\infty, z_\infty)$, $A_\lambda^\infty$ is compact for every $\lambda \in \Lambda$ and that $\limsup_{i \to \infty} A_\lambda \subset A_\lambda^\infty$ for every $\lambda \in \Lambda$. Then, we have $\limsup_{i \to \infty} \bigcap_{\lambda \in \Lambda} A_\lambda \subset \bigcap_{\lambda \in \Lambda} A_\lambda^\infty$ and $\limsup_{i \to \infty} (A_i \setminus B_r(x_i)) \subset A_\infty \setminus B_r(x_\infty)$ for every $r > 0$ and every sequence $\{x_i\}$ of points $x_i$ in $Z_i$ with $x_i \to x_\infty$.

We shall recall a fundamental covering lemma for proper metric spaces. See chapter 1 in [38] for the proof.

**Proposition 2.4.** Let $X$ be a proper metric space, $A$ a subset of $X$, $\Lambda$ a set, $\{x_\lambda\}_{\lambda \in \Lambda}$ a collection of points in $X$ and $\{r_\lambda\}_{\lambda \in \Lambda}$ a collection of positive numbers. Assume that for
every \( x \in A \) and every \( \epsilon > 0 \), there exists \( \lambda \in \Lambda \) such that \( x \in \overline{B}_{r_{\lambda}}(x_\lambda) \) and \( \text{diam} \overline{B}_{r_{\lambda}}(x_\lambda) < \epsilon \). Then, there exists a countable subset \( \Lambda_1 \) of \( \Lambda \) such that the following properties hold:

1. \( \{ \overline{B}_{r_{\lambda_i}}(x_{\lambda_i}) \}_{\lambda_i \in \Lambda_1} \) are pairwise disjoint collection.

2. We have
\[
A \setminus \bigcup_{\lambda_2 \in \Lambda_2} \overline{B}_{r_{\lambda_2}}(x_{\lambda_2}) \subset \bigcup_{\lambda \in \Lambda_1 \setminus \Lambda_2} \overline{B}_{r_{\lambda}}(x_{\lambda}),
\]
for every finite subset \( \Lambda_2 \) of \( \Lambda_1 \).

We shall recall the definition of measured Gromov-Hausdorff convergence. Let \( (Z_i, z_i) \rightarrow (Z_\infty, z_\infty) \). For a sequence \( \{v_i\}_{1 \leq i \leq \infty} \) of Radon measures \( v_i \) on \( Z_i \), we say that \( (Z_i, z_i, v_i) \) converges to \( (Z_\infty, z_\infty, v_\infty) \) with respect to the measured Gromov-Hausdorff topology if
\[
\lim_{i \rightarrow \infty} v_i(B_r(x_i)) = v_\infty(B_r(x_\infty)) \quad \text{for every } r > 0 \text{ and every sequence } \{x_i\}_i \text{ of points } x_i \text{ in } Z_i \text{ with } x_i \rightarrow x_\infty.
\]
Then we denote it by \( (Z_i, z_i, v_i) \rightarrow (Z_\infty, z_\infty, v_\infty) \). The next proposition is used many times in this paper. We skip the proof because it is not difficult to check it by using Proposition 2.4.

**Proposition 2.5.** Let \( \{(Z_i, z_i, v_i)\}_{1 \leq i \leq \infty} \) be a sequence of pointed proper geodesic spaces with Radon measures, and \( \{A_i\}_{1 \leq i \leq \infty} \) a sequence of Borel subsets \( A_i \) of \( Z_i \). Assume that \( v_i(B_1(z_i)) = 1 \), \( A_\infty \) is compact, \( (Z_i, z_i, v_i) \rightarrow (Z_\infty, z_\infty, v_\infty) \), \( \limsup_{i \rightarrow \infty} A_i \subset A_\infty \) and that for every \( R > 0 \) there exists \( \kappa = \kappa(R) \geq 1 \) such that \( v_i(B_{2r}(x_i)) \leq 2^\kappa v_i(B_r(x_i)) \) for every \( 0 < r < R \), every \( 1 \leq i \leq \infty \) and every \( x_i \in Z_i \). Then we have
\[
\limsup_{i \rightarrow \infty} v_i(A_i) \leq v_\infty(A_\infty).
\]

We shall give a proof of the following proposition:

**Proposition 2.6.** Let \( \{(Z_i, z_i, v_i)\}_{1 \leq i \leq \infty} \) be a sequence of pointed proper geodesic spaces with Radon measures. Assume that \( v_i(B_1(z_i)) = 1 \) for every \( i \), \( \text{diam} Z_\infty > 0 \), \( (Z_i, z_i, v_i) \rightarrow (Z_\infty, z_\infty, v_\infty) \), and that for every \( R > 0 \), there exists \( \kappa = \kappa(R) \geq 1 \) such that \( v_i(B_{2r}(x_i)) \leq 2^\kappa v_i(B_r(x_i)) \) for every \( 0 < r < R \), every \( 1 \leq i \leq \infty \) and every \( x_i \in Z_i \). Then, we have
\[
\lim_{i \rightarrow \infty} \sup_{0 < r < R} |v_i(B_r(x_i)) - v_\infty(B_r(\phi_i(x_i)))| = 0
\]
for every \( R \geq 1 \).

**Proof.** It is easy to check that \( \text{rad} Z_\infty > 0 \). Here \( \text{rad} X = \inf_{x_2 \in X} (\sup_{x_1 \in X} d(x_1, x_2)) \) for a metric space \( X \). Put \( \kappa = \kappa(100R) \). Let \( \tau > 0 \) with \( \tau << \text{rad} Z_\infty \). Then, there exists \( N \) such that for every \( N \leq i \leq \infty \) and every \( w \in Z_i \), there exists \( \hat{w} \in Z_i \) such
that $\overline{w} = \tau$. Since $B_\delta(w) \subset B_{\tau + \delta}(\hat{w}) \setminus B_{\tau - \delta}(\hat{w})$ for every $0 < \delta < \tau$, by [10, Lemma 3.3], there exists $\hat{\tau} << \tau$ such that $v_i(B(w)) \leq \Psi(t; \kappa, R)v_i(B_{10r}(w))$ for every $N \leq i \leq \infty$, every $w \in Z_i$ and every $0 < t < \hat{\tau}$. Fix $\epsilon > 0$. Then, there exist $N_1 \in \mathbb{N}$ and $0 < r_1 << \min\{R, \hat{\tau}, \epsilon, 1\}$ such that $v_i(B_s(z)) \leq \epsilon$ for every $N_1 \leq i \leq \infty$, every $0 < s < r_1$ and every $z \in B_R(z_i)$. Let $\{x_j\}_{1 \leq j \leq N_1} \subset B_R(z_\infty)$ and $\{t_j\}_{1 \leq j \leq N_2} \subset [0, R]$ satisfying that $B_R(z_\infty) \subset \bigcup_{j=1}^N B_{c_\varepsilon}(x_j)$ and $[0, R] \subset \bigcup_{j=1}^l B_{c_\varepsilon}(t_j)$. Let $x_j(i) \in B_R(z_i)$ with $x_j(i) \to x_j$. There exists $N_2 \geq N_1$ such that $|v_i(B_{\delta}(x_j(i))) - v_\infty(B_{\delta}(x))| < \epsilon$ for every $i \geq N_2$, every $1 \leq j \leq l$ and every $1 \leq j \leq \hat{l}$. Fix $z \in B_R(z_\infty)$ and $s \in [r_1, R]$. Let $j \in \{1, \ldots, l\}$ and $\hat{j} \in \{1, \ldots, \hat{l}\}$ satisfying that $\overline{z, x_j} < c_\varepsilon$ and $|s - t_j| < c_{\varepsilon}$. Then, by [10, Lemma 3.3], we have $|v_\infty(B_s(z)) - v_\infty(B_{t_j}(z))| \leq v_\infty(B_{s+\delta}(z)) - v_\infty(B_{s-\delta}(z)) \leq \Psi(\varepsilon; \kappa, R, \tau)v_\infty(B_R(z_\infty))$. On the other hand, for a sequence $\{z(i)_j\}$ of points $z(i)$ in $B_R(z_i)$ with $z(i) \to z$, $|v_i(B_{s}(z(i))) - v_i(B_{t_j}(z(i)))| \leq v_i(B_{s+\delta}(z(i))) - v_i(B_{s-\delta}(z(i))) \leq \Psi(\varepsilon; \kappa, R, \tau)v_i(B_R(z_i)) \leq \Psi(\varepsilon; \kappa, R, \tau)v_\infty(B_R(z_\infty))$ for every $i \geq N_2$. Thus, we have $|v_i(B_s(z(i))) - v_\infty(B_s(z))| \leq \Psi(\varepsilon; \kappa, R, \tau)v_\infty(B_R(z_\infty))$ for every $i \geq N_2$. Therefore, we have the assertion.

\[ \square \]

### 2.3 Riemannian manifolds and their limit spaces

For a real number $K$ and a pointed proper geodesic space $(Y, y)$, in this paper, we say that $(Y, y)$ is a $(n, K)$-Ricci limit space if there exist sequences of real numbers $\{K_i\}_i$, and of pointed $n$-dimensional complete Riemannian manifolds $\{(M_i, m_i)\}_i$ with $\text{Ric}_{M_i} \geq K_i(n - 1)$ such that $K_i \to K$ and $(M_i, m_i) \to (Y, y)$. Similarly, for a pointed proper geodesic space with Radon measure $(Y, y, \nu)$, we also say that $(Y, y, \nu)$ is a $(n, K)$-Ricci limit space (of $\{(M_i, m_i, \nu)\}_i$) if $(M_i, m_i, \nu) \to (Y, y, \nu)$ as above. More simply, for a $(n, 1)$-Ricci limit space $(Y, y)$ (or $(Y, y, \nu)$), we say that $(Y, y)$ is a Ricci limit space. See for instance section 4.1 in [34]. We shall fix a Ricci limit space $(Y, y, \nu)$ in this subsection and give a very short review of structure theory of Ricci limit spaces developed by Cheeger-Colding, below. See [4, 5, 6] for the details.

For pointed proper geodesic spaces $(Z, z)$ and $(X, x)$, we say that $(Z, z)$ is a tangent cone of $X$ at $x$ if there exists a sequence of positive numbers $\{r_i\}_i$ such that $r_i \to 0$ and $(X, x, r_i^{-1}d_X) \to (Z, z)$. For $k \geq 1$, we put $\mathcal{R}_k(Y) = \{x \in Y; \text{All tangent cones at } x \text{ are isometric to } \mathbb{R}^k\}$ and call it the $k$-dimensional regular set. More simply, we shall denote it by $\mathcal{R}_k$. We also put $\mathcal{R} = \bigcup_{1 \leq k \leq n} \mathcal{R}_k$ and call it the regular set. Then we have $\nu(Y \setminus \mathcal{R}) = 0$. See [4, Theorem 2.1] for the proof. For $\delta, r > 0$ and $0 < \alpha < 1$, we put $(\mathcal{R}_k)_{\delta, r} = \{x \in Y; d_{GH}((\overline{\mathcal{B}}(x), x), (\overline{\mathcal{B}}_s(0), 0)) \leq \delta s \text{ for every } 0 < s \leq r\}$ and $(\mathcal{R}_{k, \alpha})_r = \{x \in Y; d_{GH}((\overline{\mathcal{B}}(x), x), (\overline{\mathcal{B}}_s(0), 0)) \leq s^{1+\alpha} \text{ for every } 0 < s \leq r\}$. Here $0_k \in \mathbb{R}^k$. We remark that $(\mathcal{R}_k)_{\delta, r}$ and $(\mathcal{R}_{k, \alpha})_r$ are closed, $\bigcap_{\delta > 0} (\cup_{r > 0} (\mathcal{R}_k)_{\delta, r}) = \mathcal{R}_k$. We also put $\mathcal{R}_{k, \alpha} = \bigcup_{r > 0} (\mathcal{R}_{k, \alpha})_r$. By [4, Theorem 3.23] and [4, Theorem 4.6], there exists
0 < \alpha(n) < 1 such that \( v(\mathcal{R}_k \setminus \mathcal{R}_{k;\alpha(n)}) = 0 \) and that \( v \) is Ahlfors \( k \)-regular at every point in \( \mathcal{R}_{k;\alpha(n)} \) for every \( k \).

On the other hand, it is known that \( Y \) is \( \nu \)-rectifiable. See [6, Theorem 5.5] and [6, Theorem 5.7]. Thus, by section 6 in [6] or section 4 in [2], the cotangent bundle \( T^*Y \) of \( Y \) exists. We will give several fundamental properties of the cotangent bundle only:

1. \( T^*Y \) is a topological space.
2. There exists a Borel map \( \pi : T^*Y \to Y \) such that \( \nu(Y \setminus \pi(T^*Y)) = 0 \).
3. \( \pi^{-1}(w) \) is a finite dimensional real vector space with canonical inner product \( \langle \cdot, \cdot \rangle(w) \) for every \( w \in \pi(T^*Y) \).
4. For every open subset \( U \) of \( Y \) and every Lipschitz function \( f \) on \( U \), there exist a Borel subset \( V \) of \( U \), and a Borel map \( df \) (called the differential section of \( f \) or the differential of \( f \)) from \( V \) to \( T^*Y \) such that \( \nu(U \setminus V) = 0 \) and that \( \pi \circ df(w) = w \), \( |df|(w) = \text{Lip}_f(w) = \text{lip}_f(w) \) for every \( w \in V \), where \( |v|(w) = \sqrt{\langle v, v \rangle(w)} \).

We call \( \{\langle \cdot, \cdot \rangle(w)\}_{w \in \pi(T^*Y)} \) the Riemannian metric of \( Y \) and denote it by \( \langle \cdot, \cdot \rangle \). Finally, we remark that \( \nu(C_x) = 0 \) for every \( x \in Y \). See [22, Theorem 3.2]. These results above are used in section 3, essentially.

### 3 Rectifiability on limit spaces

In this section, we shall study a rectifiability of Ricci limit spaces. These results given in this section are used in section 4, essentially.

#### 3.1 Radial rectifiability

The main result in this subsection is Theorem 3.16.

**Lemma 3.1.** Let \( Z \) be a proper geodesic space, \( z \) a point in \( Z \), \( s, \delta \) positive numbers, \( v \) a Radon measure on \( Z \) and \( F \) a nonnegative valued Borel function on \( B_s(m) \). Assume that

\[
\frac{1}{v(B_s(z))} \int_{B_s(z)} F \, dv \leq \delta
\]

and that there exists \( \kappa \geq 1 \) such that \( 0 < v(B_{2t}(w)) \leq 2^s v(B_t(w)) \) for every \( w \in B_s(z) \) and every \( 0 < t \leq s \). Then, there exists a compact subset \( K \) of \( \overline{B}_{s/10^2}(z) \) such that \( v(K)/v(B_{s/10^2}(z)) \geq 1 - \Psi(\delta; \kappa) \) and

\[
\frac{1}{v(B_t(x))} \int_{B_t(x)} F \, dv \leq \Psi(\delta; \kappa)
\]
for every $x \in K$ and every $0 < t \leq s/10^2$.

**Proof.** Without loss of generality, we can assume that $F$ is a nonnegative valued Borel function on $Z$ by defining $F \equiv 0$ on $Z \setminus B_s(z)$. Fix $C > 0$ and put $A_1(C) = \{w \in B_s(z) : \int_{B_{s/10^2}(w)} Fdv \geq Cv(B_{s/10^2}(w))\}$. Let $\{x_j^1\}_{1 \leq j \leq k_1}$ be an $s/10$-maximal separated subset of $A_1(C)$. Put $A_2(C) = \{w \in B_s(m) \setminus \bigcup_{l=1}^{k_1} B_s(x_j^1) : \int_{B_{s/10^2}(w)} Fdv \geq Cv(B_{s/10^2}(w))\}$. Let $\{x_j^2\}_{1 \leq j \leq k_2}$ be an $s/10^2$-maximal separated subset of $A_2(C)$. By iterating this argument, put $A_l(C) = \{w \in B_s(m) \setminus \bigcup_{i,j=1}^{k_l} B_{s/10^i}(x_j^i) : \int_{B_{s/10^i}(w)} Fdv \geq Cv(B_{s/10^i}(w))\}$. Let $\{x_j^l\}_{1 \leq j \leq k_l}$ be an $s/10^l$-maximal separated subset of $A_l(C)$.

**Claim 3.2.** The collection $\{B_{s/10^{i+1}}(x_j^i)\}_{i,l}$ are pairwise disjoint.

Let $w \in B_{s/10^{i+1}}(x_j^i) \cap B_{s/10^{i+1}}(x_j^l)$. Assume that $l \leq i$. Then, by the construction, we have $x_j^i \in M \setminus \bigcup_{l=1}^{k_1} B_{s/10^{i+1}}(x_j^l)$. Especially, we have $x_j^i, x_j^l \geq s/10^{i+1}$. Therefore, we have $\overline{B}_{s/10^{i+1}}(x_j^i) \cap \overline{B}_{s/10^{i+1}}(x_j^l) = \emptyset$. This is a contradiction. Therefore, we have $l = i$. By the definition, we have $i = \hat{i}$. Thus, we have Claim 3.2.

It is easy to check the following claim:

**Claim 3.3.** We have $\bigcup_{i \in \mathbb{N}} A_i(C) \subset \bigcup_{i \in \mathbb{N}, 1 \leq i \leq k_l} \overline{B}_{s/10^{i+2}}(x_j^l)$

We have

$$
\sum_{i \in \mathbb{N}, 1 \leq i \leq k_l} \int_{B_{s/10^{i+1}}(x_j^l)} Fdv \geq C \sum_{i \in \mathbb{N}, 1 \leq i \leq k_l} v(B_{s/10^{i+1}}(x_j^l)) \geq CC(\kappa) \sum_{i \in \mathbb{N}, 1 \leq i \leq k_l} v(B_{s/10^{i+2}}(x_j^l)) \geq CC(\kappa)v\left(\bigcup_{i \in \mathbb{N}, 1 \leq i \leq k_l} B_{10^{i+2}}(x_j^l)\right).
$$

On the other hand, we have

$$
\sum_{i \in \mathbb{N}, 1 \leq i \leq k_l} \int_{B_{s/10^{i+1}}(x_j^l)} Fdv = \int_{\bigcup_{i \in \mathbb{N}, 1 \leq i \leq k_l} B_{s/10^{i+1}}(x_j^l)} Fdv \leq \int_{B_s(z)} Fdv \leq C(\kappa)v(B_s(z))\delta.
$$

Therefore, we have

$$
\frac{v\left(\bigcup_{i \in \mathbb{N}, 1 \leq i \leq k_l} B_{10^{i+2}}(x_j^l)\right)}{v(B_s(m))} \leq \frac{\delta}{C(\kappa)}.
$$

By letting $C = \sqrt{\delta}$ and $K = \overline{B}_{s/10^2}(z) \setminus \bigcup_{i \in \mathbb{N}, 1 \leq i \leq k_l} B_{10^{i+2}}(x_j^l)$, we have the assertion. \(\square\)

Let $(Y, g)$ be a Ricci limit space, $k$ an integer with $k \leq n$, and $r, \delta$ positive numbers with $r < 1$, $\delta < 1$. Let $(\mathcal{R}_k)^y_{\delta r}$ be the set of points $w$ in $Y$ satisfying that for every $0 < s \leq r$, there exists a map $\Phi$ from $\overline{B}_s(w)$ to $\mathbb{R}^k$ such that $\pi_1 \circ \Phi = r_y$ and that $\Phi$ is an $\delta s$-Gromov-Hausdorff approximation to $\overline{B}_s(\Phi(w))$. Here, $\pi_1$ is the projection from $\mathbb{R}^k = \mathbb{R} \times \mathbb{R}^{k-1}$ to $\mathbb{R}$ defined by $\pi_1(x_1, \ldots, x_k) = x_1$. 

10
Lemma 3.4. We have

$$\bigcap_{\delta > 0} \left( \bigcup_{r > 0} \left( (\mathcal{R}_k)^{2}_{\delta,r} \setminus C_x \right) \right) = \mathcal{R}_k \setminus C_x.$$

Proof. It is easy to check that

$$\bigcap_{\delta > 0} \left( \bigcup_{r > 0} \left( (\mathcal{R}_k)^{2}_{\delta,r} \setminus C_x \right) \right) \subset \mathcal{R}_k \setminus C_x.$$

Let \( w \in \mathcal{R}_k \setminus C_x \). For every \( \delta > 0 \), there exists \( r > 0 \) such that for every \( 0 < s < r \), there exists an \( \delta s \)-Gromov-Hausdorff approximation from \( (\overline{B}_s(0,k),0_k) \) to \( (\overline{B}_s(w),w) \). Here, \( 0_k \in \mathbb{R}^k \). On the other hand, by the splitting theorem on limit spaces [2, Theorem 9.27], there exist a pointed proper geodesic space \((W_s,w_s)\) and a map \( \hat{\phi} \) from \((\overline{B}_s(w),w)\) to \((\overline{B}_s(0,w_s),(0,w_s))\) such that \( \pi_{\mathbb{R}} \circ \hat{\phi} = r_x - \overline{x,w} \) and that \( \hat{\phi} \) is an \( \delta s \)-Gromov-Hausdorff approximation. Here, \( \overline{B}_s(0,w_s) \subset \mathbb{R} \times W_s \) with the product metric \( \sqrt{d^2_{\mathbb{R}} + d^2_{W_s}} \), \( \pi_{\mathbb{R}} \) is the projection from \( \mathbb{R} \times W_s \) to \( \mathbb{R} \). By rescaling \( s^{-1}d_{\mathbb{R}} \) and \([21, \text{Claim } 4.4] \), there exists an \( \Psi(\delta; n)s \)-Gromov-Hausdorff approximation \( f \) from \((\overline{B}_s(w_s),w_s)\) to \((\overline{B}_s(0,w_{k-1}),w_{k-1})\). Define a map \( g \) from \( \overline{B}_s(w) \) to \( \mathbb{R}^k \) by \( g(z) = (\overline{x,z}, f \circ \hat{\phi}) \). Let \( \pi_s \) be the canonical retraction from \( \mathbb{R}^k \) to \( \overline{B}_s(g(w)) \). Put \( \hat{g} = \pi_s \circ g \). Then, it is easy to check that \( \hat{g} \) is an \( \Psi(\delta; n)s \)-Gromov-Hausdorff approximation to \((\overline{B}_s(\hat{g}(w)),\overline{g}(w))\). Since \( \delta \) is arbitrary, we have the assertion. \( \square \)

Put \( \mathcal{D}_x^* = \{ w \in X; \) There exists \( \alpha \in X \) such that \( \overline{x,w} \geq \tau \) and \( \overline{x,w} + \overline{w,\alpha} = \overline{x,\alpha} \) \} for a proper geodesic space \( X \), a point \( x \in X \) and a positive number \( \tau > 0 \). It is easy to check that \( \mathcal{D}_x^* \) is closed. By the definition, we have \( \bigcup_{\tau > 0} \mathcal{D}_x^* = X \setminus C_x \). Let \( \text{Leb} A = \{ a \in A; \lim_{r \to 0} v(B_r(a) \cap A)/v(B_r(a)) = 1 \} \) for a metric measure space \((X,v)\) and a Borel subset \( A \) of \( X \).

We shall give a fundamental result about rectifiability of limit spaces by distance functions. The essential idea of the proof is to replace harmonic functions giving rectifiability in [6, Theorem 3.26] with suitable distance functions via the Poincaré inequality.

Lemma 3.5. Let \((Y,y,v)\) be a Ricci limit space, \( k \) a positive integer satisfying \( k \leq n \), \( \delta, r \) positive numbers satisfying \( \delta < 1, r < 1 \), \( x \) a point in \( Y \) and \( w \) a point in \((\mathcal{R}_k)^{2}_{\delta,r} \cap \text{Leb}((\mathcal{R}_k)^{2}_{\delta,r}) \setminus (C_x \cup \{ x \}) \). Then, there exists \( \eta(w) > 0 \) such that the following property holds: For every \( 0 < s \leq \eta(w) \), there exist a compact subset \( L \) of \( \overline{B}_s(w) \cap (\mathcal{R}_k)^{2}_{\delta,r} \) and a collection of points \( \{ x_j \}_{2 \leq j \leq k} \) in \( Y \) such that \( v(L)/v(B_s(w)) \geq 1 - \Psi(\delta; n) \) and that the map \( \Phi = (r_x,r_{x_2},\ldots,r_{x_k}) \) from \( L \) to \( \mathbb{R}^k \), is an \((1 \pm \Psi(\delta; n))\)-bi-Lipschitz equivalent to the image \( \Phi(L) \).

11
Proof. There exists $0 < \tau < r$ such that $w \in D_{x}^{r} \backslash B_{r}(x)$ and $v(B_{r}(w) \cap (R_{k})_{\delta,v})/v(B_{r}(w)) \geq 1 - \delta$ for every $0 < s < \tau$. Let $(M_{i}, m_{i}, v_{1}) \to (Y, v, \nu)$, and let $\{x_{i}\}, \{w_{i}\}$ be sequences of points $x_{i}, w_{i}$ in $M_{i}$ satisfying that $w_{i} \to w$ and $x_{i} \to x$. Fix $0 < s << \min\{\delta, \tau\}$.

Then, for every sufficiently large $i$, there exists an $\delta_{s}$-Gromov-Hausdorff approximation $\Phi_{i} = (\Phi_{i}^{1}, \ldots, \Phi_{i}^{k})$ from $(B_{s}(w_{i}), w_{i})$ to $(B_{s}(0_{k}, 0_{k}))$ such that $\Phi_{i}^{1} = r_{x_{i}} - r_{x_{i}}(w_{i})$. Put $s_{0} = \sqrt{\delta}s$. For convenience, we shall use the following notations for rescaled metrics $s_{0}^{-1}d_{M_{i}}, s_{0}^{-1}d_{Y}$: $\hat{\text{vol}} = \text{vol}^{s_{0}^{-1}d_{M_{i}}}, \hat{r}_{w}(\alpha) = s_{0}^{-1}r_{w}(\alpha), \hat{B}_{i}(\alpha) = B_{i}^{s_{0}^{-1}d_{M_{i}}}(\alpha) = B_{s_{0}^{2}}(\alpha), \hat{\nu} = v/v(B_{s_{0}}(y)), \hat{g} = s_{0}^{-1}g$ for a Lipschitz function $g$ and so on. We also denote the differential section of $g$ as rescaled manifolds $(M_{i}, s_{0}^{-1}d_{M_{i}})$ by $\hat{d}g : M_{i} \to T^{*}M_{i}$ and denote the Riemannian metric of $(M_{i}, s_{0}^{-1}d_{M_{i}})$ by $\langle \cdot, \cdot \rangle_{s_{0}} = s_{0}^{-2}\langle \cdot, \cdot \rangle$. We remark that $(M_{i}, m_{i}, s_{0}^{-1}d_{M_{i}}, \text{vol}^{s_{0}^{-1}d_{M_{i}}}) \to (Y, y, s_{0}^{-1}d_{Y}, \hat{\nu})$. The following claim follows from the proof of the splitting theorem on limit spaces (see for instance [2, Lemma 9.8], [2, Lemma 9.10] and [2, Lemma 9.13]).

Claim 3.6. For every sufficiently large $i$, there exist collections of harmonic functions $\{\hat{b}_{j}^{i}\}_{1 \leq j \leq k}$ on $\hat{B}_{10^{2}}(w_{i})$, and of points $\{x_{j}^{i}\}_{2 \leq j \leq k}$ in $\hat{B}_{\sqrt{\delta}^{-1}}(w_{i})$ such that $|\hat{b}_{j}^{i} - \hat{r}_{x_{j}^{i}}|_{L^{\infty}(\hat{B}_{10^{2}}(w_{i}))} \leq \Psi(\delta; n)$,

$$\frac{1}{\text{vol} \hat{B}_{10^{2}}(w_{i})} \int \hat{B}_{10^{2}}(w_{i}) (|\hat{d}\hat{b}_{j}^{i} - \hat{d}\hat{r}_{x_{j}^{i}}|^{2}_{s_{0}} + |\text{Hess}\hat{b}_{j}^{i}|^{2}_{s_{0}}) d\hat{\text{vol}} \leq \Psi(\delta; n),$$

and

$$\frac{1}{\text{vol} \hat{B}_{10^{2}}(w_{i})} \int \hat{B}_{10^{2}}(w_{i}) |\langle \hat{d}\hat{b}_{j}^{i}, \hat{b}_{l}^{i} \rangle_{s_{0}}| d\hat{\text{vol}} = \delta_{jl} \pm \Psi(\delta; n)$$

for every $1 \leq j \leq l \leq k$, where $x = x_{1}^{i}$ for every $i$.

Define a nonnegative valued Borel function $F_{i}$ on $\hat{B}_{10^{2}}(w_{i})$ by

$$F_{i} = \sum_{l=1}^{k} \text{Lip}(\hat{b}_{j}^{i} - \hat{r}_{x_{j}^{i}})^{2} + \sum_{l \neq j} |\langle \hat{d}\hat{b}_{j}^{i}, \hat{d}\hat{b}_{l}^{i} \rangle_{s_{0}}| + \sum_{l=1}^{k} |\text{Hess}\hat{b}_{j}^{i}|^{2}_{s_{0}}.$$

By Lemma 3.1, for every sufficiently large $i$, there exists a compact subset $K_{i}$ of $\hat{B}_{10^{2}}(w_{i})$ such that $\text{vol} K_{i}/\text{vol} \hat{B}_{10^{2}}(w_{i}) \geq 1 - \Psi(\delta; n)$ and

$$\frac{1}{\text{vol} \hat{B}_{i}(\alpha)} \int \hat{B}_{i}(\alpha) F_{i} d\hat{\text{vol}} \leq \Psi(\delta; n)$$

for every $\alpha \in K_{i}$ and every $0 < t < 100$.

Claim 3.7. For every sufficiently large $i$, every $\alpha \in K_{i} \cap \hat{B}_{50}(w_{i})$, every $1 \leq j \leq k$, and every $0 < t < 50$, there exists a constant $C_{j}^{i}$ such that $\hat{b}_{j}^{i} = \hat{r}_{x_{j}^{i}} + C_{j}^{i} \pm \Psi(\delta; n)t$ on $\hat{B}_{t}(\alpha)$.
The proof is as follows. By the Poincaré inequality, we have

\[
\frac{1}{\text{vol } B_t(\alpha)} \int_{B_t(\alpha)} \left| \begin{bmatrix} \hat{b}_j^i - \hat{r}_{x_j} \\ \hat{b}_k^i - \hat{r}_{x_k} \end{bmatrix} \right| - \frac{1}{\text{vol } B_t(\alpha)} \int_{B_t(\alpha)} (\hat{b}_j^i - \hat{r}_{x_j}) d\text{vol} \right| d\text{vol} 
\]

\[
\leq tC(n) \sqrt{\frac{1}{\text{vol } B_t(\alpha)} \int_{B_t(\alpha)} (\text{Lip}(\hat{b}_1^i - \hat{r}_{x_1}))^2 d\text{vol}} 
\]

\[
\leq t\Psi(\delta; n). 
\]

For \( C > 0 \), let \( A_j(C) \) be the set of points \( \beta \in \hat{B}_t(\alpha) \) satisfying that

\[
\left| \begin{bmatrix} \hat{b}_j^i(\beta) - \hat{r}_{x_j}(\beta) \\ \hat{b}_k^i(\beta) - \hat{r}_{x_k}(\beta) \end{bmatrix} \right| - \frac{1}{\text{vol } B_t(\alpha)} \int_{B_t(\alpha)} (\hat{b}_j^i - \hat{r}_{x_j}) d\text{vol} \right| \geq C. 
\]

Then, we have

\[
\Psi(\delta; n)t \geq \frac{1}{\text{vol } B_t(\alpha)} \int_{B_t(\alpha)} \left| \begin{bmatrix} \hat{b}_j^i - \hat{r}_{x_j} \\ \hat{b}_k^i - \hat{r}_{x_k} \end{bmatrix} \right| - \frac{1}{\text{vol } B_t(\alpha)} \int_{B_t(\alpha)} (\hat{b}_j^i - \hat{r}_{x_j}) d\text{vol} \right| d\text{vol} \geq C \frac{\text{vol } A_j(C)}{\text{vol } B_t(\alpha)}. 
\]

Put \( C = \sqrt{\Psi(\delta; n)t} \) for \( \Psi(\delta; n) \) as above. Then we have \( \text{vol } A_j(C)/\text{vol } B_t(\alpha) \leq \sqrt{\Psi(\delta; n)}. \)

Assume that there exist \( \beta \in \hat{B}_t(\alpha) \) and \( \epsilon > 0 \) such that \( \hat{B}_t(\beta) \subset A_j(C) \). Then, by Bishop-Gromov volume comparison theorem, we have \( C(n)\epsilon^n \leq \text{vol } B_t(\beta)/\text{vol } \hat{B}_t(\alpha) \leq \text{vol } A_j(C)/\text{vol } B_t(\alpha) \leq \sqrt{\Psi(\delta; n)}. \) Therefore, by letting \( \epsilon = \left( 2C(n)^{-1} \sqrt{\Psi(\delta; n)} \right)^{1/n} \), we have a contradiction.

Put \( C = \sqrt{\Psi(\delta; n)t} \). Let \( \beta \in \hat{B}_t(\alpha) \) and \( \hat{\beta} \in \hat{B}_{t(1-\epsilon)t}(\alpha) \) with \( \hat{r}_\beta(\hat{\beta}) < \epsilon t. \)

Then, there exists \( \gamma \in \hat{B}_{t(\beta)} \setminus A_j(C) \). Especially, we have \( \gamma \in \hat{B}_t(\alpha) \). By the definition of \( A_j(C) \), we have

\[
\hat{b}_j^i(\gamma) = \hat{r}_{x_j}(\gamma) + \frac{1}{\text{vol } B_{100}(\alpha)} \int_{B_{100}(\alpha)} (\hat{b}_j^i - \hat{r}_{x_j}) d\text{vol} \pm \sqrt{\Psi(\delta; n)t}. 
\]

By Cheng-Yau’s gradient estimate (see [7]), we have \( |\nabla \hat{b}_j^i|_{s_0} \leq C(n) \). Thus, we have

\[
\hat{b}_j^i(\beta) = \hat{r}_{x_j}(\beta) + \frac{1}{\text{vol } B_{100}(\alpha)} \int_{B_{100}(\alpha)} (\hat{b}_j^i - \hat{r}_{x_j}) d\text{vol} \pm \Psi(\epsilon; n)t. 
\]

Therefore we have Claim 3.7.

By an argument similar to the proof of [6, Theorem 3.3], we have the following:

**Claim 3.8.** For every sufficiently large \( t \), every \( \alpha \in K_i \cap \hat{B}_{50}(w_i) \) and every \( 0 < t \leq 10^{-5} \), there exist a compact subset \( Z_t \) of \( M_t \), a point \( z_t \in Z_t \) and a map \( \phi \) from \( (\hat{B}_t(\alpha), \alpha) \) to \( (\hat{B}_t(z_t), \alpha) \) such that the map \( \Phi = (\hat{b}_1^i, \ldots, \hat{b}_k^i, \phi) \) from \( \hat{B}_t(\alpha) \) to \( \overline{B}_{t+\Psi(\delta; n)t}(\alpha) \subset \mathbb{R}^k \times Z_t, \sqrt{d_{R^k}^2 + (s_0^{-1}d_{M_t})^2} \), is an \( \Psi(\delta; n)t \)-Gromov-Hausdorff approximation.
Put \( \hat{K}_i = K_i \cap \hat{B}_{40}(w_i) \). Then, we have \( \hat{\text{vol}} K_i / \text{vol} \hat{B}_{40}(w_i) \geq 1 - \Psi(\delta; n) \). By Gromov’s compactness theorem, without loss of generality, we can assume that there exist a compact subset \( K_\infty \) of \( \hat{B}_{40}(w) \) and a collection \( \{ x_j \}^{2 \leq j \leq k} \) of points in \( Y \) such that \( x_j \to x_j^\infty \) and \( K_i \to K_\infty \). By Proposition 2.5, we have \( \hat{\nu}(K_\infty) / \nu(\hat{B}_{40}(w)) \geq 1 - \Psi(\delta; n) \). On the other hand, by Claim 3.7 and 3.8, for every \( \alpha, \beta \), we have 

\[
\text{let } \text{Gromov-Hausdorff approximation. Put } \hat{\Phi} \text{ such that the map } \hat{\Phi} \text{ from } ( \hat{B}_t(\alpha), \alpha ) \text{ to } ( \hat{B}_t(z_\infty), z_\infty ) \text{ such that the map } \hat{\phi} = (\hat{r}_x, \hat{r}_{x_1^\infty}, \ldots, \hat{r}_{x_k^\infty}) \text{ from } \hat{B}_t(\alpha) \text{ to } \hat{B}_t(\Psi(\delta; n)t(\hat{\phi}(\alpha))) \text{ is an } \Psi(\delta; n)t \text{-Gromov-Hausdorff approximation. Put } K_\infty = K_\infty \cap (R_k)_\delta \cap \hat{B}_{10-\delta}(w). \text{ Then, we have}
\]

\[\nu(K_\infty) / \nu(\hat{B}_{10-\delta}(w)) \geq 1 - \Psi(\delta; n).\]

On the other hand, for every \( \alpha \in K_\infty \) and every \( 0 < t \leq 10^{-5} \), there exist a compact metric space \( Z_\infty \), a point \( z_\infty \in Z_\infty \), and a map \( \Phi \) from \( ( \hat{B}_t(\alpha), \alpha ) \) to \( ( \hat{B}_t(z_\infty), z_\infty ) \) such that the map \( \hat{\phi} = (\hat{r}_x, \hat{r}_{x_1^\infty}, \ldots, \hat{r}_{x_k^\infty}) \) from \( \hat{B}_t(\alpha) \) to \( \hat{B}_t(\Psi(\delta; n)t(\hat{\phi}(\alpha))) \) is an \( \Psi(\delta; n)t \)-Gromov-Hausdorff approximation. Especially, for every \( \alpha, \beta \), \( K_\infty \) with \( \alpha \neq \beta \), by letting \( t = \hat{r}_\alpha(\beta)(\leq 10^{-5}) \), we have

\[
\sqrt{(\alpha_0^{-1}\partial \alpha^{-1} - x, x, \beta_0^{-1}\partial \beta^{-1} dY)}^2 + \sum_{l=2}^{k} \left( x_l^\infty, \alpha_0^{-1}\partial \alpha^{-1} - x_l^\infty, \beta_0^{-1}\partial \beta^{-1} dY \right)^2 = \alpha, \beta_0^{-1}\partial \beta^{-1} dY \pm \Psi(\delta; n)t
\]

\[
= (1 - \Psi(\delta; n))\alpha_0^{-1}\partial \alpha^{-1} dY.
\]

Therefore, we have the assertion. \( \square \)

**Lemma 3.9.** Let \((Y, y, v)\) be a Ricci limit space and \( x \) a point in \( Y \). Then, there exist collections of compact subsets \( \{ C^x_{k,i} \}_{1 \leq k \leq n, i \in \mathbb{N}} \) of \( Y \), and of points \( \{ x^i_{k,i} \}_{2 \leq k \leq n, i \in \mathbb{N}} \) in \( Y \) such that the following properties hold:

1. \( \bigcup_{i \in \mathbb{N}} C^x_{k,i} \subset R_k \) and \( v(R_k \setminus \bigcup_{i \in \mathbb{N}} C^x_{k,i}) = 0 \) for every \( k \).
2. For every \( z \in \bigcup_{i \in \mathbb{N}} C^x_{k,i} \) and every \( 0 < \delta < 1 \), there exists \( C^x_{k,i} \) such that \( z \in C^x_{k,i} \) and that the map \( \Phi^x_{k,i} = (r_x, r_{x_1^i}, \ldots, r_{x_k^i}) \) from \( C^x_{k,i} \) to \( \mathbb{R}^k \), is \((1 \pm \delta)\)-bi-Lipschitz to the image \( \Phi^x_{k,i}(C^x_{k,i}) \).

**Proof.** Put

\[
A_k = \bigcap_{m_1 \in \mathbb{N}} \left( \bigcup_{m_2 \in \mathbb{N}} \left( (R_k)_{1/m_1,1/m_2} \cap \text{Leb}((R_k)_{1/m_1,1/m_2}) \setminus (C_x \cup \{x\}) \right) \right).
\]

**Claim 3.10.** We have \( A_k \subset R_k \) and \( v(R_k \setminus A_k) = 0 \).

The proof is as follows. Put

\[
B_k = \bigcap_{m_1 \in \mathbb{N}} \left( \bigcup_{m_2 \in \mathbb{N}} \left( (R_k)_{1/m_1,1/m_2} \cap \text{Leb}((R_k)_{1/m_1,1/m_2}) \setminus (C_x \cup \{x\}) \right) \right).
\]
Then we have $A_k \subset B_k$ and $v(B_k \setminus A_k) = 0$. On the other hand, by Lemma 3.4, we have $B_k = \mathcal{R}_k \setminus (C_x \cup \{x\})$. Since $v(C_x) = 0$, we have Claim 3.10.

For every $z \in A_k$ and every $N \in \mathbb{N}$, there exists $m_2 = m_2(z, N)$ such that $z \in (\mathcal{R}_k)^{\tau}_{1/N,1/m_2} \cap \text{Leb}((\mathcal{R}_k)^{\tau}_{1/N,1/m_2} \setminus (C_x \cup \{x\}))$. By Lemma 3.5, there exists $\eta(z, N) > 0$ such that for every $0 < s \leq \eta(z, N)$, there exist a compact subset $L(z, s, N)$ of $\overline{B}_s(z) \cap (\mathcal{R}_k)^{\tau}_{1/N,1/m_2}$ and a collection of points $\{x_j(z, s, N)\}_{1 \leq j \leq k}$ in $Y$ such that $v(L(z, s, N))/v(\overline{B}_s(z)) \geq 1 - \Psi(N^{-1}; n)$ and that the map $\Phi_{z,s,N} = (r_x, r_{x_2}(z,s,N), \ldots, r_{x_k}(z,s,N))$ from $L(z, s, N)$ to $\mathbb{R}^k$, is $(1 \pm \Psi(N^{-1}; n))$-bi-Lipschitz to the image. Fix $R > 1$ and $N \in \mathbb{N}$. By Lemma 2.4, there exists a pairwise disjoint collection $\{\overline{B}_{s_i}^{N,R}(z_i^{N,R})\}_{i \in \mathbb{N}}$ such that $z_i^{N,R} \in A_k \cap \overline{B}_R(y)$, $0 < s_i^{N,R} \leq \eta(z_i^{N,R}, N)/100$ and $A_k \cap \overline{B}_R(y) \setminus \bigcup_{i=1}^{m} \overline{B}_{s_i}^{N,R}(z_i^{N,R}) \subset \bigcup_{i=m+1}^{\infty} \overline{B}_{s_i}^{N,R}(z_i^{N,R})$ for every $m$. Put $\hat{L}(i, N, R) = L(z_i^{N,R}, 5s_i^{N,R}, N) \cap A_k \cap \overline{B}_R(y) \subset A_k \cap \overline{B}_R(y)$.

**Claim 3.11.** $v(A_k \cap \overline{B}_R(y) \setminus \bigcup_{N \geq N_0, i \in \mathbb{N}} \hat{L}(i, N, R)) = 0$ for every $N_0 \in \mathbb{N}$.

Because we have

$$v\left(A_k \cap \overline{B}_R(y) \setminus \bigcup_{i \in \mathbb{N}} \hat{L}(i, N, R)\right) \leq v\left(\bigcup_{i \in \mathbb{N}} \left(\overline{B}_{5s_i}^{N,R}(z_i^{N,R}) \cap A_k \cap \overline{B}_R(y)\right) \setminus \bigcup_{i \in \mathbb{N}} \left(L(z_i^{N,R}, 5s_i^{N,R}, N) \cap A_k \cap \overline{B}_R(y)\right)\right) \leq \sum_{i \in \mathbb{N}} v(\overline{B}_{5s_i}^{N,R}(z_i^{N,R}) \setminus L(z_i^{N,R}, 5s_i^{N,R}, N)) \leq \Psi(N^{-1}; n) \sum_{i \in \mathbb{N}} v(B_{s_i}^{N,R}(z_i^{N,R})) \leq \Psi(N^{-1}; n) v(B_{2R}(y)).$$

for every $N \geq N_0$. Therefore, by letting $N \to \infty$, we have Claim 3.11.

By Claim 3.11, we have $v\left(A_k \cap \overline{B}_R(y) \setminus \bigcap_{N \geq N_0, i \in \mathbb{N}} \hat{L}(i, N, R)\right) = 0$. Put $E(i, N, R) = \hat{L}(i, N, R) \cap \bigcap_{i \in \mathbb{N}} \left(\bigcup_{N \geq N_0, i \in \mathbb{N}} \hat{L}(i, N, R)\right)$. Then, we have $v(A_k \cap \overline{B}_R(y) \setminus \bigcup_{i \in \mathbb{N}} E(i, N, R) = 0$. Fix $z \in \bigcup_{i \in \mathbb{N}} E(i, N, R)$ and $0 < \delta < 1$. Then there exist $i, N$ such that $z \in E(i, N, R)$. Let $N_0 \in \mathbb{N}$ with $N_0^{-1} \ll \delta$. Then there exist $\hat{N} \geq N_0$ and $\hat{i} \in \mathbb{N}$ such that $z \in \hat{L}(\hat{i}, \hat{N}, R)$. By the definition, the map $\phi = (r_x, r_{x_2}(z_{\hat{i}}^{\hat{N},R}, s_{\hat{i}}^{\hat{N},R}), \ldots, r_{x_k}(z_{\hat{i}}^{\hat{N},R}, s_{\hat{i}}^{\hat{N},R}))$ from $L(z_{\hat{i}}^{\hat{N},R}, s_{\hat{i}}^{\hat{N},R}, \hat{N})$ to $\mathbb{R}^k$, is $\Psi(N^{-1}, n)$-bi-Lipschitz to the image. Especially, the map is $(1 \pm \delta)$-bi-Lipschitz to the image. We remark that $\hat{L}(\hat{i}, \hat{N}, R) \subset L(z_{\hat{i}}^{\hat{N},R}, s_{\hat{i}}^{\hat{N},R}, \hat{N})$ and $z \in \hat{L}(\hat{i}, \hat{N}, R) \cap \bigcap_{i \in \mathbb{N}} \left(\bigcup_{j \geq \hat{i}} \hat{L}(p, j, R)\right) = E(\hat{i}, \hat{N}, R)$. Therefore, by letting $x_j(i, N, R) = x_j(z_{\hat{i}}^{\hat{N},R}, s_{\hat{i}}^{\hat{N},R}, R)$ for every $2 \leq j \leq k$, we have the following claim:
Claim 3.12. For every \( z \in \bigcup_{i,N \in \mathbb{N}} E(i, N, R) \) and every \( 0 < \delta < 1 \), there exists \( E(i, N, R) \) such that \( z \in E(i, N, R) \) and that the map \( \phi = (r_x, r_{x_2(i,N,R)}, \ldots, r_{x_k(i,N,R)}) \) from \( E(i, N, R) \) to \( \mathbb{R}^k \), is \((1 \pm \delta)\)-bi-Lipschitz to the image.

By Claim 3.12, it is easy to check the assertion. \( \square \)

Lemma 3.13. With the same notation as in Lemma 3.9, for every \( k,i \), let \( \{F_{k,i,j}^x\}_{j \in \mathbb{N}} \) be a collection of Borel subsets of \( C_{k,i}^x \), with \( \nu\left(C_{k,i}^x \setminus \bigcup_{j \in \mathbb{N}} F_{k,i,j}^x\right) = 0 \). Then, there exists a collection of Borel subsets \( \{E_{k,i,j}^x\}_{k,i,j} \) of \( Y \) such that \( E_{k,i,j}^x \subset F_{k,i,j}^x \), \( \nu(F_{k,i,j}^x \setminus E_{k,i,j}^x) = 0 \) and that for every \( k,i \), \( z \in \bigcup_{j \in \mathbb{N}} E_{k,i,j}^x \) and every \( 0 < \delta < 1 \), there exists \( E_{k,i,j}^x \) such that \( z \in E_{k,i,j}^x \) and that the map \( \Phi_{k,i,j}^x = (x_r, r_{x_2^i}, \ldots, r_{x_k^i}) \) from \( E_{k,i,j}^x \) to \( \mathbb{R}^k \), is \((1 \pm \delta)\)-bi-Lipschitz to the image.

Proof. Fix \( 1 \leq k \leq n \). For every \( M \in \mathbb{N} \), put \( B_M = \{i \in \mathbb{N} : \text{The map } \phi = (x_r, r_{x_2^i}, \ldots, r_{x_k^i}) \text{ from } C_{k,i}^x \text{ to } \mathbb{R}^k, \text{is } (1 \pm M^{-1})\text{-bi-Lipschitz to the image}\} \) and \( E_{k,i,j}^x = \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M, j \in \mathbb{N}} F_{k,i,j}^x \right) \).

Claim 3.14. \( \nu(F_{k,i,j}^x \setminus E_{k,i,j}^x) = 0 \).

The proof is as follows. By Lemma 3.9, we have \( \bigcup_{i \in \mathbb{N}} C_{k,i}^x \subset \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M} C_{k,i}^x \right) \). On the other hand, it is easy to check that \( \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M} C_{k,i}^x \right) \subset \bigcup_{i \in \mathbb{N}} C_{k,i}^x \). Therefore, we have \( \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M} C_{k,i}^x \right) = \bigcup_{i \in \mathbb{N}} C_{k,i}^x \). Thus, \( \nu(F_{k,i,j}^x \setminus E_{k,i,j}^x) = \nu(F_{k,i,j}^x \cap \bigcup_{M \in \mathbb{N}} C_{k,i}^x) \setminus E_{k,i,j}^x) = \nu(F_{k,i,j}^x \cap \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M, j \in \mathbb{N}} F_{k,i,j}^x \right) \setminus E_{k,i,j}^x) = 0 \). Therefore we have Claim 3.14.

Claim 3.15. For every \( z \in \bigcup_{i,j \in \mathbb{N}} E_{k,i,j}^x \) and every \( 0 < \delta < 1 \), there exists \( E_{k,i,j}^x \) such that \( z \in E_{k,i,j}^x \) and that the map \( \phi = (x_r, r_{x_2^i}, \ldots, r_{x_k^i}) \) from \( E_{k,i,j}^x \) to \( \mathbb{R}^k \), is \((1 \pm \delta)\)-bi-Lipschitz to the image.

The proof is as follows. Let \( M,i,j \) be positive integers with \( M^{-1} << \delta \). There exist \( N_0 \in B_M \) and \( N_1 \in \mathbb{N} \) such that \( z \in \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M, j \in \mathbb{N}} F_{k,i,j}^x \right) \). Therefore, we have \( z \in \bigcap_{M \in \mathbb{N}} \left( \bigcup_{i \in B_M, j \in \mathbb{N}} F_{k,i,j}^x \right) = E_{k,N_0,N_1}^x \) and that the map \( \phi = (x_r, r_{x_2^i}, \ldots, r_{x_k^i}) \) from \( E_{k,N_0,N_1}^x \) to \( \mathbb{R}^k \), is \((1 \pm M^{-1})\)-bi-Lipschitz to the image. Thus, we have Claim 3.15.

By Claim 3.14 and 3.15, we have the assertion. \( \square \)

The following theorem is the main result in this subsection. See (2.2) in [5] or [22, Definition 4.1] for the definition of the measure \( \nu_{-1} \).

Theorem 3.16 (Radial rectifiability). Let \( (Y,y,v) \) be a Ricci limit space with \( Y \neq \{y\} \), and \( x \) a point in \( Y \). Then, there exist collections of Borel subsets \( \{C_{k,i}^x\}_{1 \leq k \leq n, i \in \mathbb{N}} \) of \( Y \), of points \( \{x_{k,i}\}_{2 \leq k \leq n, i \in \mathbb{N}} \) in \( Y \), a positive number \( 0 < \alpha(n) < 1 \) and a Borel subset \( A \) of \([0, \text{diam}\, Y)\) such that the following properties hold:
1. \( \bigcup_{i \in \mathbb{N}} C^x_{k,i} \subset R_{k,a(n)} \setminus C_z \) and \( v \left( R_k \setminus \bigcup_{i \in \mathbb{N}} C^x_{k,i} \right) = 0 \) for every \( k \).

2. \( \lim_{r \to 0} v(B_r(z) \cap C^x_{k,i})/v(B_r(z)) = 1 \) for every \( C^x_{k,i} \) and every \( z \in C^x_{k,i} \).

3. For every \( C^x_{k,i} \), there exists \( A^x_{k,i} > 1 \) such that \( (A^x_{k,i})^{-1} \leq v(B_r(z))/r^k \leq A^x_{k,i} \) for every \( z \in C^x_{k,i} \) and every \( 0 < r < 1 \).

4. The limit measure \( v \) and the \( k \)-dimensional Hausdorff measure \( H^k \) are mutually absolutely continuous on \( C^x_{k,i} \).

5. For every \( z \in \bigcup_{i \in \mathbb{N}} C^x_{k,i} \) and every \( 0 < \delta < 1 \), there exists \( C^x_{k,i} \) such that \( z \in C^x_{k,i} \) and that the map \( \Phi^x_{k,i} = (r_{x_{k,i}^1}, \ldots, r_{x_{k,i}^k}) \) from \( C^x_{k,i} \) to \( \mathbb{R}^k \), is \((1 \pm \delta)\)-bi-Lipschitz to the image.

6. \( H^1([0, \text{diam} Y] \setminus A) = 0 \).

7. For every \( R \in A \), the collection \( \{\partial B_R(x) \cap C^x_{k,i}\}_{k,i} \subset \partial B_R(x) \setminus C_z \) satisfies the following properties:

   (a) \( v_{-1} \left( (\partial B_R(x) \setminus C_z) \setminus \bigcup_{1 \leq k \leq n, i \in \mathbb{N}} C^x_{k,i} \right) = 0 \).

   (b) For every \( \partial B_R(x) \cap C^x_{k,i} \), there exist \( B_{k,i}^x > 1 \) and \( \tau_{k,i}^x > 0 \) such that \( (B_{k,i}^x)^{-1} \leq v_{-1}(\partial B_R(x) \cap B_r(z) \setminus C_z)/r^k \leq v_{-1}(\partial B_R(x) \cap B_r(z))/r^{k-1} \leq B_{k,i}^x \) for every \( z \in \partial B_R(x) \cap C^x_{k,i} \) and every \( 0 < r < \tau_{k,i}^x \).

   (c) For every \( z \in \bigcup_{i \in \mathbb{N}} (\partial B_R(x) \cap C^x_{k,i}) \) and every \( 0 < \delta < 1 \), there exists \( \partial B_R(x) \cap C^x_{k,i} \) such that \( z \in \partial B_R(x) \cap C^x_{k,i} \) and that the map \( \hat{\Phi}^x_{k,i} = (r_{x_{k,i}^1}, \ldots, r_{x_{k,i}^k}) \) from \( \partial B_R(x) \cap C^x_{k,i} \) to \( \mathbb{R}^{k-1} \), is \((1 \pm \delta)\)-bi-Lipschitz to the image.

Especially, \( \partial B_R(x) \setminus C_z \) is \( v_{-1}\)-rectifiable.

**Proof.** First, we shall prove the following claim:

**Claim 3.17.** We have \( v_{-1}(\partial B_{\overline{r}(x)}(z)) \leq C(n)v(B_r(z))/\epsilon \) for every \( R > 0 \), every \( z \in \overline{B}_R(x) \setminus \{x\} \) and every \( \epsilon > 0 \) with \( \epsilon < \min\{\overline{z}, x]/100, 1\} \).

The proof is as follows. By [23, Corollary 5.7], we have

\[
\frac{v_{-1}(\partial B_{\overline{r}(x)}(z) \cap \overline{B}_r(z))}{\text{vol } \partial B_{\overline{r}(x)}(p)} \leq C(n) \frac{v(C_x(\partial B_{\overline{r}(x)}(z) \cap \overline{B}_r(z)) \cap A_{\overline{r}-2\epsilon, \overline{r}}(x))}{\text{vol } A_{\overline{r}-2\epsilon, \overline{r}}(p)}.
\]

Here \( C_x(A) = \{z \in Y; \text{ There exists } a \in A \text{ such that } x/z + z/a = x/a\} \) for every subset \( A \) of \( Y \), \( p \) is a point in the \( n \)-dimensional hyperbolic space form. On the other hand, by
triangle inequality, we have $C_x(\partial B_{\frac{r}{100}}(x) \cap B_\epsilon(z)) \cap A_{\frac{r}{100} - 2r, \frac{r}{100}}(x) \subset B_{100r}(z)$. Thus, we have
\[
v_{-1}(\partial B_{\frac{r}{100}}(x) \cap B_\epsilon(z)) \leq \frac{\vol \partial B_{\frac{r}{100}}(p)}{\vol A_{\frac{r}{100} - 2r, \frac{r}{100}}(p)} v(B_{100r}(z)) C(n) \leq C(n, R) \frac{1}{\epsilon} v(B_\epsilon(z)).
\]

Therefore, we have Claim 3.17.

Let $\{C_{k,i}^x\}_{k,i}$ be a collection of Borel subsets of $Y$ and $\{x_{k,i}\}_{k,i}$ a collection of points in $Y$ as in Lemma 3.9. By Lemma 3.13, without loss of generality, we can assume that for every $C_{k,i}^x$, there exists $\tau > 0$ such that $C_{k,i}^x \subset \mathcal{D}_x^Y \setminus B_\tau(x)$. Moreover, by [6, Theorem 3.23] and [6, Theorem 4.6], we can assume that for every $C_{k,i}^x$, there exists $A_{k,i}^x > 1$ such that $(A_{k,i}^x)^{-1} \leq v(B_\tau(z))/r^k \leq A_{k,i}^x$ for every $0 < r < 1$ and every $z \in C_{k,i}^x$, and that $\lim_{r \to 0} v(B_\tau(z) \cap C_{k,i}^x)/v(B_\epsilon(z)) = 1$ for every $C_{k,i}^x$ and every $z \in C_{k,i}^x$.

**Claim 3.18.** Let $(Y, y, v)$ be a Ricci limit space, $x$ a point in $Y$, $\tau, R$ positive numbers with $0 < \tau < 1 < R$, and $z$ a point in $\mathcal{D}_x^Y \cap B_R(x) \setminus B_\tau(x)$. Then, we have $v_{-1}(\partial B_{\frac{r}{100}}(x) \cap B_\epsilon(z) \setminus C_x) \geq C(n, R) v(B_\epsilon(z))/\epsilon$ for every $0 < \epsilon < \tau/100$.

The proof is as follows. Let $w \in Y$ with $\frac{\epsilon}{100}, \frac{r}{100} + \frac{\epsilon}{100} = \frac{\tau}{100}, \frac{r}{100}$. By [23, Theorem 4.6], we have
\[
v(B_{\frac{r}{100}w}(w)) \leq C(n) \frac{v_{-1}(C_x(B_{\frac{r}{100}w}(w)) \cap \partial B_{\frac{r}{100}}(x))}{\vol \partial B_{\frac{r}{100}}(p)}.
\]
By triangle inequality, we have $C_x(B_{\frac{r}{100}w}(w)) \cap \partial B_{\frac{r}{100}}(x) \subset \partial B_{\frac{r}{100}}(x) \cap B_\epsilon(z)$. Thus, by Bishop-Gromov volume comparison theorem for $\nu$, we have
\[
v_{-1}(\partial B_{\frac{r}{100}}(x) \cap B_\epsilon(z) \setminus C_x) \geq C(n) \frac{\vol \partial B_{\frac{r}{100}}(p)}{\vol A_{\frac{r}{100} - 2\frac{r}{100}, \frac{r}{100}}(p)} v(B_{\frac{r}{100}}(w)) \geq C(n, R) \frac{1}{\epsilon} v(B_{5\epsilon}(w)) \geq C(n, R) \frac{v(B_\epsilon(z))}{\epsilon}.
\]
Therefore we have Claim 3.18.

By Claim 3.17 and 3.18, for every $C_{k,i}^x$, there exist $B_{k,i}^x > 1$ and $\tau_{k,i}^x > 0$ such that $(B_{k,i}^x)^{-1} \leq v_{-1}(\partial B_{\frac{r}{100}}(x) \cap B_\epsilon(z) \setminus C_x)/r^k \leq B_{k,i}^x$ for every $z \in C_{k,i}^x$ and every $0 < r < \tau_{k,i}^x$. Put $\hat{A} = \{t \in [0, \text{diam}Y), v_{-1}(\partial B_{\frac{r}{100}}(x) \setminus C_{k,i}^x) = 0\}$. Since $v(Y \setminus C_{k,i}^x) = 0$, it follows from [23, Proposition 5.1] and [23, Theorem 5.2] that $\hat{A}$ is Lebesgue measurable and that $H^1([0, \text{diam}Y] \setminus \hat{A}) = 0$. Since $H^1$ is a Radon measure on $\mathbb{R}$, we have the assertion.

### 3.2 Calculation of radial derivatives of Lipschitz functions

The purpose in this subsection is to calculate the radial derivative from a given point $x$, of a given Lipschitz function $f$: $\langle dr_x, df \rangle$ explicitly. The main result in this subsection is Theorem 3.30.
**Lemma 3.19.** Let \((Y, y)\) be a Ricci limit space with \(Y \neq \{y\}\), \(z\) a point in \(Y \setminus C_y\), \(f\) a Lipschitz function on \(Y\), \(\tau\) a positive number and \(\gamma_i\) an isometric embedding from \([0, \gamma_i(z) + \tau]\) to \(Y\) satisfying \(\gamma_i(0) = y\), \(\gamma_i(z) = z\) for every \(i \in \{1, 2\}\). Put \(f_i = f \circ \gamma_i\). Then, we have \(\text{lip}_{1} f_{i}(y, \gamma_i(z)) = \text{lip}_{2} f_{i}(y, \gamma_i(z))\) and \(\text{Lip}_{1} f_{i}(y, \gamma_i(z)) = \text{Lip}_{2} f_{i}(y, \gamma_i(z))\).

**Proof.** For every real number \(\epsilon\) with \(0 < |\epsilon| < \tau\), by the splitting theorem on limit space, we have \(\gamma_i(x, z + \epsilon), \gamma_2(x, z + \epsilon) \leq \Psi(|\epsilon|; n)|\epsilon|\). Therefore, we have

\[
\frac{|f_1(x, z + \epsilon) - f_2(x, z)|}{|\epsilon|} \leq \frac{|f_2(x, z + \epsilon) - f_2(x, z)|}{|\epsilon|} + \text{Lip}_{\Psi}(|\epsilon|; n).
\]

Thus, we have \(\text{Lip}_{1} f_{1}(y, \gamma_i(z)) \leq \text{Lip}_{2} f_{2}(y, \gamma_i(z))\) and \(\text{lip}_{1} f_{1}(y, \gamma_i(z)) \leq \text{lip}_{2} f_{2}(y, \gamma_i(z))\). Therefore we have \(\text{Lip}_{1} f_{1}(y, \gamma_i(z)) = \text{Lip}_{2} f_{2}(y, \gamma_i(z))\) and \(\text{lip}_{1} f_{1}(y, \gamma_i(z)) = \text{lip}_{2} f_{2}(y, \gamma_i(z))\).

Let \((Y, y)\) be a Ricci limit space, \(z\) a point in \(Y \setminus C_y\), \(\tau\) a positive number, \(\gamma\) an isometric embedding from \([0, \gamma(z) + \tau]\) to \(Y\) satisfying \(\gamma(0) = y\), \(\gamma(z) = z\). Put \(F = f \circ \gamma\), \(\text{lip}_{\gamma}(z) = \text{Lip}_{\gamma} F(y, z)\) and \(\text{lip}_{\gamma}(z) = \text{Lip}_{\gamma} F(y, z)\). It is not difficult to check the following lemma:

**Lemma 3.20.** Let \((Z, \nu)\) be a metric measure space. Assume that the following properties hold:

1. \(\nu(B_r(z)) > 0\) for every \(z \in Z\) and every \(r > 0\)
2. There exist \(r_0 > 0\) and \(\kappa > 1\) such that \(\nu(B_{2r}(z)) \leq 2^{\kappa} \nu(B_r(z))\) for every \(z \in Z\) and every \(0 < r < r_0\).

Then, we have \(\text{Lip}(f) = \text{Lip}(f|_A)(a)\) and \(\text{lip}(f) = \text{lip}(f|_A)(a)\) for every \(a \in \text{Leb}(A)\), every Lipschitz function \(f\) on \(Z\), and every Borel subset \(A\) of \(Z\).

The following theorem implies that \(\partial B_r(x) \perp \nabla r_x\) in some sense:

**Theorem 3.21.** Let \((Y, y, v)\) be a Ricci limit space, \(x\) a point in \(Y\) and \(f\) a Lipschitz function on \(Y\). Then, we have the following:

1. \(\text{lip}(z) = \text{lip}_{\nu}(f)^2 + \text{lip}(f|_{\partial B_r(z)})(z)^2\) for a.e. \(z \in Y\).
2. \(\text{Lip}(z)^2 = \text{Lip}_{\nu}(f)^2 + \text{Lip}(f|_{\partial B_r(z)})(z)^2\) for a.e. \(z \in Y\).
3. \(\text{Lip}(f|_{\partial B_r(z)})(z) = \text{lip}(f|_{\partial B_r(z)}) \cap C_x(z)\) for a.e. \(z \in Y \setminus C_x\).

**Proof.** First we shall remark the following:

**Claim 3.22.** Let \(f\) be a Lipschitz function on \(\mathbb{R}^k\). Then, we have \(\text{Lip}(z)^2 = (\text{Lip}(f|_{\mathbb{R}^k \setminus \{1\}})(z)^2 + (\text{lip}(f|_{\mathbb{R}^k \setminus \{1\}})(z)^2\) for a.e. \(z = (z_1, \ldots, z_k) \in \mathbb{R}^k\).
Because, by Rademacher’s theorem about differentiability of Lipschitz functions on $\mathbb{R}^k$, $f$ is totally differentiable at a.e $z \in \mathbb{R}^k$. Therefore we have Claim 3.22.

The next claim is clear:

**Claim 3.23.** Let $\{Z_i\}_{i=1,2}$ be metric spaces, $\delta$ a positive number with $0 < \delta < 1$, and $\Phi$ a map from $Z_1$ to $Z_2$ satisfying that $\Phi(Z_1) = Z_2$ and $(1 - \delta)x_1, x_2 \leq \phi(x_1), \phi(x_2) \leq (1 + \delta)x_1, x_2$ for every $x_1, x_2 \in Z_1$. Then, for every Lipschitz function $f$ on $Z_2$, we have, $(1 - \Psi(\delta))\text{Lip}_f(\Phi(z_1)) \leq \text{Lip}(f \circ \phi)(z_1) \leq (1 + \Psi(\delta))\text{Lip}_f(\Phi(z_1)) \leq \text{lip}(f \circ \phi)(z_1) \leq (1 + \Psi(\delta))\text{lip}(\Phi(z_1))$ for every $z_1 \in Z_1$.

We will give a proof of the following claim in Appendix:

**Claim 3.24.** For every Lebesgue measurable subset $A$ of $\mathbb{R}^k$, put $s_l - \text{Leb}A = \{a = (a_1, \ldots, a_k) \in A; \lim_{r \to 0} H^{k-1}(\{a_1 \times B_r(a_2, \ldots, a_k) \cap A) \cap H^{k-1}(\{a_1 \times B_r(a_2, \ldots, a_k) = 1\}. Then the following properties hold:

1. $s_l - \text{Leb}A$ is a Lebesgue measurable set.
2. $H^{k-1}(A \cap (\{t\} \times \mathbb{R}^{k-1} \setminus s_l - \text{Leb}A)) = 0$ for every $t \in \mathbb{R}$.
3. $H^k(A \setminus s_l - \text{Leb}A) = 0$.

Put $L = \text{Lip}_f$. Let $\{C_{k,i}^{x}\}_{1 \leq k \leq n, i \in \mathbb{N}}$ be a collection of Borel subsets of $Y$, and $\{x_{k,i}\}_{2 \leq k \leq n, i \in \mathbb{N}, 2 \leq k \leq l}$ a collection of points in $Y$ as in Theorem 3.16. Fix a sufficiently small $\delta > 0$ and $C_{k,i}$ satisfying that the map $\Phi_{k,i} = (r_x, r_{x_2}, \ldots, r_{x_{k,i}})$ from $C_{k,i}$ to $\mathbb{R}^k$, is $(1 + \delta)$-bi-Lipschitz to the image. Put $f_{k,i} = f \circ (\Phi_{k,i})^{-1}$ on $\Phi_{k,i}(C_{k,i})$. Let $F_{k,i}$ be a Lipschitz function on $\mathbb{R}^k$ satisfying that $F_{k,i}|_{\Phi_{k,i}(C_{k,i})} = f_{k,i}$ and $\text{Lip}F_{k,i} = \text{Lip}f_{k,i}$.

**Claim 3.25.** With the notation as above, we have the following:

1. $(1 - \Psi(\delta; n))\text{Lip}_f F_{k,i}(w) \leq \text{Lip}(\phi(\Phi_{k,i})^{-1}(w)) \leq (1 + \Psi(\delta; n))\text{Lip}_f F_{k,i}(w)$ for a.e $w \in \Phi_{k,i}(C_{k,i})$.
2. $(1 - \Psi(\delta; n))\text{lip}_f F_{k,i}(w) \leq \text{lip}(\phi(\Phi_{k,i})^{-1}(w)) \leq (1 + \Psi(\delta; n))\text{lip}_f F_{k,i}(w)$ for a.e $w \in \Phi_{k,i}(C_{k,i})$.
3. $\text{Lip}(F_{k,i}r \times \{w_2, \ldots, w_{k}\})(w) - L\Psi(\delta; n) \leq \text{Lip}_r f(\phi(\Phi_{k,i})^{-1}(w)) \leq \text{Lip}(F_{k,i}r \times \{w_2, \ldots, w_{k}\})(w) + L\Psi(\delta; n)$ for a.e $w = (w_1, \ldots, w_k) \in \Phi_{k,i}(C_{k,i})$.
4. $\text{Lip}(F_{k,i}r \times \{w_2, \ldots, w_{k}\})(w) - L\Psi(\delta; n) \leq \text{lip}_r f(\phi(\Phi_{k,i})^{-1}(w)) \leq \text{lip}(F_{k,i}r \times \{w_2, \ldots, w_{k}\})(w) + L\Psi(\delta; n)$ for a.e $w = (w_1, \ldots, w_k) \in \Phi_{k,i}(C_{k,i})$.
5. $(1 - \Psi(\delta; n))\text{Lip}(F_{k,i}|_{\{w_1\} \times \mathbb{R}^{k-2}}(w)) \leq \text{Lip}(\phi_{B, \{w_1\} \times \mathbb{R}^{k-2}}(\phi(\Phi_{k,i})^{-1}(w))(\Phi_{k,i})^{-1}(w)) \leq (1 + \Psi(\delta; n))\text{Lip}(F_{k,i}|_{\{w_1\} \times \mathbb{R}^{k-1}}(w))$ for a.e $w = (w_1, \ldots, w_k) \in \Phi_{k,i}(C_{k,i})$. 

20
6. \((1 - \Psi(\delta; n))\text{lip}(F_{k,i}^\pi|_{\{w_1\} \times R^{k-1}}(w)) \leq \text{lip}(f|_{\tilde{E}_{z,(\Phi_{k,i})^{-1}}(w) \cap C_{k,i}^\pi})((\Phi_{k,i}^\pi)^{-1}(w)) \leq (1 + \Psi(\delta; n))\text{lip}(F_{k,i}^\pi|_{\{w_1\} \times R^{k-1}}(w)) \) for a.e. \(w = (w_1, \ldots, w_k) \in \Phi_{k,i}^\pi(C_{k,i}^\pi).

The proof is as follows. First, we shall give a proof of the statement 1. Put \(C_{k,i}^\pi = \text{Leb}(\Phi_{k,i}^\pi(C_{k,i}^\pi)) \cap \Phi_{k,i}^\pi(\text{Leb}C_{k,i}^\pi).\) Then, we have \(H^k(\Phi_{k,i}^\pi(C_{k,i}^\pi) \setminus C_{k,i}^\pi) = 0.\) By Lemma 3.20 and Claim 3.23, we have \((1 - \Psi(\delta))\text{lip}(F_{k,i}^\pi|_{\{w_1\} \times C_{k,i}^\pi})(w) \leq \text{Lip}(f|_{C_{k,i}^\pi})((\Phi_{k,i}^\pi)^{-1}(w)) \leq (1 + \Psi(\delta))\text{lip}(F_{k,i}^\pi|_{\{w_1\} \times C_{k,i}^\pi})(w), \) \(\text{lip}(F_{k,i}^\pi|\Phi_{k,i}^\pi(C_{k,i}^\pi))(w) = \text{Lip}F_{k,i}^\pi(w)\) and \(\text{Lip}(f|_{C_{k,i}^\pi})((\Phi_{k,i}^\pi)^{-1}(w)) = \text{Lip} f((\Phi_{k,i}^\pi)^{-1}(w))\) for every \(w \in C_{k,i}^\pi.\) Therefore we have the statement 1. Similarly, we have the statement 2.

Next, we shall give a proof of the statement 3. Put \(C_{k,i}^{x,f} = s_l - \text{Leb}C_{k,i}^\pi \cap \{w \in R^k; F_{k,i}^\pi\text{ is totally differentiable at }w\}.\) Then, by Claim 3.24, we have \(H^k(C_{k,i}^\pi \setminus C_{k,i}^{x,f}) = 0.\) Fix \(w \in C_{k,i}^{x,f}\) and put \(w_\epsilon = w + (\epsilon, 0, \ldots, 0)\) for every \(\epsilon > 0.\) Since \(w \in s_l - \text{Leb}C_{k,i}^\pi,\) for every \(\epsilon > 0,\) there exist \(\tilde{w}_\epsilon \in C_{k,i}^\pi\) and \(a(\epsilon) > 0\) such that \(w_\epsilon, \tilde{w}_\epsilon \leq a(\epsilon)\) and \(a(\tau) \to 0\) as \(\tau \to 0.\) It is clear that \((1 - \delta)\epsilon - a(\epsilon) \leq (1 - \delta)w, \tilde{w}_\epsilon \leq (\Phi_{k,i}^\pi)^{-1}(w), (\Phi_{k,i}^\pi)^{-1}(\tilde{w}_\epsilon) \leq (1 + \delta)\epsilon - \tilde{w}_\epsilon \leq (1 + \delta)(\epsilon + a(\epsilon)).\) Let \(\pi_1\) be the projection from \(R^k\) to \(R\) defined by \(\pi_1(w) = w_1.\) Then we have \(x,(\Phi_{k,i}^\pi)^{-1}((\tilde{w}_\epsilon) = \pi_1(w_\epsilon) = a(\epsilon)\pi_1(w) + \epsilon \pm a(\epsilon)\epsilon = x, (\Phi_{k,i}^\pi)^{-1}(w), (\Phi_{k,i}^\pi)^{-1}(\tilde{w}_\epsilon) \pm (\epsilon + a(\epsilon))\epsilon.\) By Lemma 3.13, without loss of generality, we can assume that there exists \(\tau_0 > 0\) such that \(C_{k,i} \subset D^\nu_x.\) Fix an isometric embedding \(\gamma\) from \([0, x, (\Phi_{k,i}^\pi)^{-1}(w) + \tau_0] \) to \(Y\) with \(\gamma(0) = x, \gamma(x, (\Phi_{k,i}^\pi)^{-1}(w)) = (\Phi_{k,i}^\pi)^{-1}(w).\) Then, by rescaling \(\epsilon^{-1}dy\) and the splitting theorem on limit spaces, we have \(\text{Lip}(\gamma(x, (\Phi_{k,i}^\pi)^{-1}(w) + \epsilon) \leq \Psi(\epsilon, \delta; n)\epsilon.\) Thus we have

\[
\frac{|F_{k,i}^\pi(w) - F_{k,i}^\pi(w_\epsilon)|}{\epsilon} \leq \frac{|F_{k,i}^\pi(w) - F_{k,i}^\pi(\tilde{w}_\epsilon)|}{\epsilon} + La(\epsilon),
\]

\[
\leq \frac{|f((\Phi_{k,i}^\pi)^{-1}(w)) - f(\gamma(x, (\Phi_{k,i}^\pi)^{-1}(w) + \epsilon))|}{\epsilon} + L\Psi(a(\epsilon), \delta; n)
\]

for every \(\epsilon > 0\) with \(\epsilon << \tau_0.\) By letting \(\epsilon \to 0,\) we have \(\text{Lip}(F_{k,i}^\pi|_{R \times \{w_2, \ldots, w_k\}})(w) \leq \text{Lip}_{x} (f((\Phi_{k,i}^\pi)^{-1}(w)) + L\Psi(\delta; n).\) Let \(\{\epsilon_j\}_j\) be a sequence of real numbers such that \(\epsilon_j \to 0\) and

\[
\lim_{j \to \infty} \frac{|f(\gamma(x, (\Phi_{k,i}^\pi)^{-1}(w) + \epsilon_j)) - f(\gamma(x, (\Phi_{k,i}^\pi)^{-1}(w) + \epsilon_j))|}{\epsilon_j} = \text{Lip}^{\text{rad}} f((\Phi_{k,i}^\pi)^{-1}(w)).
\]

Since \((\Phi_{k,i}^\pi)^{-1}(w) \in \text{Leb}C_{k,i}^\pi,\) there exist sequences \(\{\tilde{w}(j)\}_j \subset C_{k,i}, \{\tau_j\}_j \subset R_{>0}\) such that \(\tilde{w}(j), \gamma(x, (\Phi_{k,i}^\pi)^{-1}(w) + \epsilon_j) \leq \tau_j \epsilon_j\) and \(\tau_j \to 0\) as \(j \to \infty.\) Fix \(j \in \mathbb{N}.\) Assume that \(\epsilon_j > 0.\) Then, we have

\[
\pi_1(\tilde{w}(j)) - \pi_1(w) = x, \tilde{w}(j) - x, (\Phi_{k,i}^\pi)^{-1}(w)
\]

\[
= x, \gamma(x, (\Phi_{k,i}^\pi)^{-1}(w) + \epsilon_j) \pm \tau_j \epsilon_j
\]

\[
= \epsilon_j \pm \tau_j \epsilon_j.
\]
On the other hand, since \( \Phi_{k,i}^x(\tilde{w}(j)), w \leq (1+\delta)\epsilon_j + \tau_j \epsilon_j \), we have \( w + (\epsilon_j, 0, \ldots, 0), \Phi_{k,i}^x(\tilde{w}(j)) \leq \Psi(\epsilon_j, \delta; n)|\epsilon_j| \) in the case \( \epsilon_j < 0 \). Put \( w(j) = w + (\epsilon_j, 0, \ldots, 0) \). Then, we have
\[
\frac{|f(\Phi_{k,i}^x(\tilde{w}(j))) - f(\gamma(x, (\Phi_{k,i}^x)^{-1}(w) + \epsilon_j))|}{|\epsilon_j|} \leq \frac{|F_{k,i}^x(w) - F_{k,i}^x(\Phi_{k,i}^x(\tilde{w}(j)))|}{|\epsilon_j|} + L\tau_j
\]
\[
\leq \frac{|F_{k,i}^x(w) - F_{k,i}^x(w(j))|}{|\epsilon_j|} + L\Psi(\epsilon_j, \tau_j, \delta; n).
\]

By letting \( j \to \infty \), we have the statement 5. Similarly, we have the statement 4. We shall give a proof of the statement 5. Fix \( w \in \mathbf{C}_{k,j}^x \). By Claim 3.23, we have
\[
(1 - \Psi(\delta))\text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1} \cap \mathbf{C}_{k,i}^x})(w) \leq \text{Lip}(f|_{\Phi_{k,i}^x(\{w\} \times \mathbb{R}^{k-1} \cap \mathbf{C}_{k,i}^x)}((\Phi_{k,i}^x)^{-1}(w))
\]
\[
\leq (1 + \Psi(\delta))\text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1} \cap \mathbf{C}_{k,i}^x})(w).
\]

We remark that \( (\Phi_{k,i}^x)^{-1}((\{w\} \times \mathbb{R}^{k-1}) \cap \mathbf{C}_{k,i}^x) = \partial B_{x,(\Phi_{k,i}^x)^{-1}(w)}(\{\Phi_{k,i}^x\}^{-1}(\mathbf{C}_{k,i}^x)) \). By Proposition 3.20, we have \( \text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1} \cap \mathbf{C}_{k,i}^x})(w) = \text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1}})(w) \). Therefore, by Claim 3.23, we have
\[
(1 - \Psi(\delta))\text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1}})(w) \leq \text{Lip}(f|_{\partial B_{x,(\Phi_{k,i}^x)^{-1}(w)}(\{\Phi_{k,i}^x\}^{-1}(\mathbf{C}_{k,i}^x))}((\Phi_{k,i}^x)^{-1}(w))
\]
\[
\leq \text{Lip}(f|_{\partial B_{x,(\Phi_{k,i}^x)^{-1}(w)}(\mathbf{C}_{k,i}^x)})((\Phi_{k,i}^x)^{-1}(w))
\]
\[
\leq (1 + \Psi(\delta))\text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1}}(\mathbf{C}_{k,i}^x))(w)
\]
\[
\leq (1 + \Psi(\delta))\text{Lip}(F_{k,i}^x|_{\{w\} \times \mathbb{R}^{k-1}})(w).
\]

Thus we have the statement 5. Similarly, we have the statement 6.

Therefore we have Claim 3.25.

**Claim 3.26.** With the same notation as in Claim 3.25, we have
\[
\text{lip}(f|_{\partial B_{x,(\Phi_{k,i}^x)^{-1}(w)}(\mathbf{C}_{k,i}^x)})((\Phi_{k,i}^x)^{-1}(w)) \geq \text{lip}(f|_{\partial B_{x,(\Phi_{k,i}^x)^{-1}(w)}(\mathbf{C}_{k,i}^x)})((\Phi_{k,i}^x)^{-1}(w)) - \Psi(\delta; n, L)
\]
for a.e \( w \in \Phi_{k,i}^x(\mathbf{C}_{k,i}^x) \).

The proof is as follows. We shall use the same notation as in the proof of Claim 3.25. Fix \( w \in \Phi_{k,i}^x(\text{Leb}(\Phi_{k,i}^x(\mathbf{C}_{k,i}^x))) \) and put \( z = (\Phi_{k,i}^x)^{-1}(w) \).

First, assume \( k \geq 2 \). Then we shall prove that \( z \) is not an isolated point in \( \partial B_{\tau(x)}(x) \setminus C_x \). Because, by the definition of \( s_l \setminus \text{Leb}(\mathbf{C}_{k,i}^x) \), there exists a sequence of points \( \{\beta(j)\} \) in \( \mathbf{C}_{k,i}^x \) such that \( \pi_1(\beta(j)) = \pi_1(w), \beta(j) \neq w \) for every \( j \), and \( \beta(j) \to w \). Then, we have \( (\Phi_{k,i}^x)^{-1}(\beta(j)) \neq z, (\Phi_{k,i}^x)^{-1}(\beta(j)) \in \partial B_{\tau(x)}(x) \setminus C_x \) and \( (\Phi_{k,i}^x)^{-1}(\beta(j)) \to z \). Especially, \( z \) is not an isolated point in \( \partial B_{\tau(x)}(x) \setminus C_x \). Let \( \{z(j)\} \subseteq \partial B_{\tau(x)}(x) \setminus \{z\} \) with
that

Then, there exists a sequence \( r \) such that \( \tau \to 0 \) as \( j \to \infty \). Therefore, there exists \( \hat{\alpha}(j) \) such that \( \hat{\alpha}(j) \leq \alpha(j) \leq \hat{\alpha}(j) \leq \hat{\Psi}(\hat{\tau}_j; n) \eta_j \). Then, we have

\[
\frac{|f(\hat{z}(j)) - f(z)|}{\eta_j} \leq \left| F_{\hat{\tau}, \hat{z}}(\hat{\alpha}(j)) - F_{\hat{\tau}, \hat{z}}(\hat{\alpha}(j)) \right| \frac{\hat{\alpha}(j), w}{\eta_j} + L \hat{\Psi}(\hat{\tau}_j; n, L).
\]

By letting \( j \to \infty \), we have Claim 3.26 for the case \( k \geq 2 \).

Next, assume \( k = 1 \). It suffices to check that \( z \) is an isolated point in \( \partial B_{\hat{\tau}, \hat{z}}(x) \). The proof is done by a contradiction. Assume that \( z \) is not an isolated point in \( \partial B_{\hat{\tau}, \hat{z}}(x) \). Then, there exists a sequence \( \{ \hat{z}(i) \} \) of points in \( \partial B_{\hat{\tau}, \hat{z}}(x) \) such that \( \hat{z}(i) \to z \). On the other hand, there exist \( \tau_0 > 0 \) and an isometric embedding \( \gamma \) from \( [0, \hat{\tau}, \hat{z} + \tau_0] \) to \( Y \) such that \( \gamma(0) = x \) and \( \gamma(\hat{\tau}, \hat{z}) = z \). Put \( \epsilon(i) = z - \hat{z}(i) \). Then we have \( \hat{z}(i), \hat{\tau}(\hat{\tau}, \hat{z} - \epsilon(i)) \geq x, \hat{z}(i) - x, \hat{\tau}(\hat{\tau}, \hat{z} + \epsilon(i)) \geq x, \hat{\tau}(\hat{\tau}, \hat{z} + \epsilon(i)) - x, \hat{z}(i) = \epsilon(i) \). By Gromov’s compactness theorem, without loss of generality, we can assume that \( (Y, \epsilon, dz, y) \) converges to a tangent cone \( (T_z Y, 0_z) \) at \( z \). By the argument above and the splitting theorem on limit spaces, there exists a pointed proper geodesic space \( (W, w) \) such that \( T_z Y = R \times W \) and \( W \neq \{ w \} \). However, since \( z \in C_i \subset R_1 \), this is a contradiction.

Therefore we have the Claim 3.26.

By Claim 3.22, 3.25 and 3.26, for every \( N \in N \), we have \( \text{Lip}(f(z))^2 = \text{Lip}^\text{rad}(f(z))^2 + \text{Lip}(f\big|_{\partial B_{\hat{\tau}, \hat{z}}(x)}(z))^2 + N^{-1} = \text{lip}^\text{rad}(f(z))^2 + \text{lip}(f\big|_{\partial B_{\hat{\tau}, \hat{z}}(x) \setminus C_x}(z))^2 + N^{-1} = \text{lip}(f(z))^2 + N^{-1} \) for a.e. \( z \in Y \setminus C_x \). Therefore, we have the assertion. \( \square \)

**Remark 3.27.** For every Ricci limit space \( (Y, y, v) \) and every Lipschitz function \( f \) on \( Y \), we have \( \text{lip}(f) = \text{Lip}(f) \) for a.e. \( x \in Y \). See [2, Corollary 6.36]

By an argument similar to the proof of Lemma 3.19, we have the following:

**Lemma 3.28.** Let \( (Y, y) \) be a Ricci limit space with \( Y \neq \{ y \} \), \( z \) a point \( Y \setminus C_y \), \( f \) a Lipschitz function on \( Y \), \( \tau \) a positive number and \( \{ \gamma_i \}_{i=1,2} \) isometric embeddings from \( [0, \hat{\gamma}_i, \hat{z} + \tau] \) to \( Y \) with \( \gamma_i(0) = y, \gamma_i(\hat{\gamma}_i, \hat{z}) = z \). Then, we have \( \liminf_{r \to 0} |f \circ \gamma_i(\hat{\gamma}_i, \hat{z} + r) - f(z)|/\tau = \liminf_{r \to 0} |f \circ \gamma_2(\hat{\gamma}_2, \hat{z} + r) - f(z)|/\tau \). Moreover, if the limit \( \lim_{r \to 0} (f \circ \gamma_1(\hat{\gamma}_1, \hat{z} + r) - f(z))/\tau \) exists, then, we have \( \lim_{r \to 0} (f \circ \gamma_2(\hat{\gamma}_2, \hat{z} + r) - f(z))/\tau \).

With the same notation as in Lemma 3.28, put \( \text{Lip}^\text{rad}(f(z)) = \liminf_{r \to 0} |f \circ \gamma_1(\hat{\gamma}_1, \hat{z} + r) - f(z)|/\tau | \). Let \( (Y, y) \) be a Ricci limit space with \( Y \neq \{ y \} \), and \( f \) a Lipschitz function
on $Y$. Put

$$A_y = \left\{ x \in Y \setminus C_y : \text{The limit } \lim_{r \to 0} \frac{f \circ \gamma(x, y + r) - f(x)}{r} \text{ exists} \right\}.$$ 

Here $\gamma$ is an isometric embedding from $[0, \overline{x}, z + \tau]$ ($\tau > 0$) to $Y$ with $\gamma(0) = y$, $\gamma(\overline{x}, x) = x$.

Put

$$\frac{df}{dr_y}(x) = \lim_{r \to 0} \frac{f \circ \gamma(x, y + r) - f(x)}{r}$$

for every $x \in A_y$.

**Lemma 3.29.** Let $(Y, y, v)$ be a Ricci limit space, $x$ a point in $Y$ and $f$ a Lipschitz function on $Y$. Then, we have $\text{Lip}_x^{\text{rad}} f(z) = \text{Lip}_{z'}^{\text{rad}} f(z)$ for a.e. $z \in Y$.

**Proof.** We will use the same notation as in the proof of Claim 3.25. Put $L = \text{Lip}_f$.

Let $\delta$ be a sufficiently small positive number and $C_{k,i}^\tau$ a Borel subset of $Y$ satisfying that the map $\Phi_{k,i}^\tau = (r_x, r_{x,1}, \ldots, r_{x,n})$ from $C_{k,i}^\tau$ to $\mathbb{R}^k$, is $(1 + \delta)$-bi-Lipschitz to the image. Fix $w \in C_{k,i}^\tau$ and put $z = (\Phi_{k,i}^\tau)^{-1}(w)$. There exist a positive number $\tau$ and an isometric embedding $\gamma$ from $[0, \overline{x}, z + \tau]$ to $Y$ such that $\gamma(0) = x$ and $\gamma(\overline{x}, z) = z$. Let $\{\epsilon_i\}_i$ be a sequence of real numbers satisfying that $\epsilon_i \to 0$ and $\lim_{k \to \infty} |f \circ \gamma(\overline{x}, z + \epsilon_i) - f(z)|/|\epsilon_i| = \text{Lip}_x^{\text{rad}} f(z)$. By an argument similar to the proof of Claim 3.12, there exist sequences $\{\hat{w}(j)\}_j \subset C_{k,i}^\tau$ and $\{\tau_j\}_j \subset \mathbb{R}_{>0}$ such that $\hat{w}(j), \gamma(\overline{x}, z + \epsilon_j) \leq \tau_j|\epsilon_j|$, $\tau_j \to 0$ as $j \to \infty$, and

$$\frac{|f(z) - f(\gamma(\overline{x}, z + \epsilon_j))|}{|\epsilon_j|} = \frac{|F_{k,i}^{\tau}(w) - F_{k,i}^{\tau}(\Phi_{k,i}(\hat{w}(j)))|}{|\epsilon_j|} - 2L\tau_j \geq \frac{|F_{k,i}^{\tau}(w) - F_{k,i}^{\tau}(w_j)|}{|\epsilon_j|} - \Psi(\tau_j, \delta; n, L).$$

By letting $j \to \infty$, we have $\text{Lip}_x^{\text{rad}} f(z) \geq \text{Lip}(F_{k,i}^{\tau}|_{\mathbb{R}^k(x_2, \ldots, x_d)})(w) - \Psi(\delta; n, L) \geq \text{Lip}_x^{\text{rad}} f(z) - \Psi(\delta; n, L)$. Therefore, we have the assertion.

We shall state the main theorem in this subsection:

**Theorem 3.30 (Radial derivatives of Lipschitz functions).** Let $(Y, y, v)$ be a Ricci limit space with $Y \neq \{y\}$, $x$ a point in $Y$ and $f$ a Lipschitz function on $Y$. Then, we have $v(Y \setminus A_x) = 0$ and

$$\frac{df}{dr_x}(z) = \langle df, dr_x \rangle(z)$$

for a.e. $z \in A_x$.

**Proof.** For every $w \in Y \setminus C_x$, there exist $\tau > 0$ and an isometric embedding $\gamma$ from $[0, \overline{x}, z + \tau]$ to $Y$ such that $\gamma(0) = x$ and $\gamma(\overline{x}, w) = w$. Then, by Theorem 3.21 and Lemma
In this section, we will give a generalization of Theorem 3.16. The main result in this section, for a.e. \( w \in Y \setminus C_x \), we have

\[
\langle dr_x, df \rangle (w) = \frac{1}{2} (\text{Lip}(r_x + f)(w)^2 - \text{Lipf}(w)^2 - \text{Lip} r_x(w)^2) \\
= \frac{1}{2} (\text{Lip}^\text{rad}(r_x + f)(w)^2 + \text{Lip}(r_x + f)|_{\partial B_{100}(x) \setminus C_x})(w)^2 \\
- \text{Lip}^\text{rad} f(w)^2 - \text{Lip}(f|_{\partial B_{100}(x) \setminus C_x}))(w)^2 - 1) \\
= \frac{1}{2} (\text{Lip}^\text{rad}(r_x + f)(w)^2 + \text{Lip}(f)(w)^2) \\
- \text{Lip}^\text{rad} f(w)^2 - \text{Lip} f(w)^2 - 1) \\
= \frac{1}{2} \left( \lim_{h \to 0} \left| \frac{\gamma(x,w) + h - (r_x + f)(w)}{h^2} - \lim_{h \to 0} \frac{|f \circ \gamma(x,w) + h - f(w)|^2}{h^2} - 1 \right) \right) \\
= \frac{1}{2} \left( \lim_{h \to 0} \left| 1 + \frac{f \circ \gamma(x,w) + h - f(w)}{h} \right|^2 - \lim_{h \to 0} \frac{|f \circ \gamma(x,w) + h - f(w)|^2}{h^2} - 1 \right) \\
= \frac{1}{2} \lim_{h \to 0} \frac{f \circ \gamma(x,w) + h - f(w)}{h} = df_{dr_x}(w).
\]

\[ \tag*{\Box} \]

### 3.3 Rectifiability associated with Lipschitz functions

In this section, we will give a generalization of Theorem 3.16. The main result in this subsection is Theorem 3.49.

**Lemma 3.31.** Let \( \delta \) be a positive number, \( \{(M_i, m_i)\}_i \) a sequence of \( n \)-dimensional complete Riemannian manifolds with \( \text{Ric}_{M_i} \geq -\delta(n-1) \), \( (Y, y, v) \) a \((n, -\delta)\)-Ricci limit space of \( \{(M_i, m_i, \text{vol})\}_i \), \( x, x_1, x_2 \) points in \( Y \), \( x(i), x_1(i), x_2(i) \) points in \( M_i \) for every \( i \), \( b_1 \) a harmonic function on \( B_{100}(x(i)) \) for every \( i < \infty \), and \( b_1^\infty \) a Lipschitz function on \( B_{100}(x) \). Assume that \( x, x_1 \geq \delta^{-1} \), \( x, x_2 \geq \delta^{-1} \), \( x, x_1 + x, x_2 - x_1, x_2 \leq \delta \), \( x(i) \to x, x_j(i) \to x_j(i) \) for every \( j \in \{1, 2\} \), \( \sup_i \text{Lip} b_1 < \infty \), \( b_1 \to b_1^\infty \) on \( B_{100}(x) \), \( |b_1^\infty - r_{x_1(i)}|_{L^\infty(B_{100}(x(i)))} \leq \delta \) and

\[
\frac{1}{\text{vol} B_{100}(x(i))} \int_{B_{100}(x(i))} \left( |\nabla b_1^\infty - \nabla r_{x_1(i)}|^2 + |\text{Hess} b_1^\infty|^2 \right) \text{dvol} \leq \delta
\]

25
Then, we have
\[
\frac{1}{v(B_1(x))} \int_{B_1(x)} |db_1^\infty - dr_{x_1}|^2 dv < \Psi(\delta; n).
\]

We remark that Lemma 3.31 does not follow from [2, Lemma 9.10] directly. We shall give a proof of Lemma 3.31 in the proof of the following Lemma 3.32.

**Lemma 3.32.** Let \( \delta \) be a positive number, \( \{ (M_i, m_i) \}_i \) a sequence of \( n \)-dimensional complete Riemannian manifolds with \( \text{Ric}_{M_i} \geq -\delta (n-1) \), \( (Y, y, v) \) a \( (n, -\delta) \)-Ricci limit space of \( \{ (M_i, m_i, \text{vol}) \}_i \), \( x \) a point in \( Y \), \( \{ x_j \}_{1 \leq j \leq 4} \) a collection of points in \( Y \), and \( \{ x(i) \} \cup \{ x_j(i) \}_{1 \leq j \leq 4} \) of points in \( M_i \) for every \( i \). Assume that \( x(i) \to x \), \( x_j(i) \to x_j \) for every \( j \), \( x, x_j, x_j \) is \( \delta \)-1 for every \( j \), \( x, x_1 + x_2 - x_1, x_2 \leq \delta \) and \( x, x_3 + x_4 - x_3, x_4 \leq \delta \).

Then, we have
\[
\frac{1}{v(B_1(x))} \int_{B_1(x)} \langle dr_{x_1}, dr_{x_3} \rangle dv - \frac{1}{v(B_1(x))} \int_{B_1(x)} \langle dr_{x_1(i)}, dr_{x_3(i)} \rangle d\text{vol} \rightarrow 0
\]
and
\[
\frac{1}{v(B_1(x))} \int_{B_1(x)} \langle dr_{x_1(i)}, dr_{x_3(i)} \rangle - \frac{1}{v(B_1(x))} \int_{B_1(x)} \langle dr_{x_1}, dr_{x_3} \rangle dv \rightarrow 0
\]
for every sufficiently large \( i \).

**Proof.** First, we remark the following claim:

**Claim 3.33.** For every sufficiently large \( i \), there exist harmonic functions \( b_1^i, b_3^i \) on \( B_{100}(x(i)) \) such that \( \text{Lip} b_j^i \leq C(n) \), \( |b_j^i - r_{x_j(i)}|_{L^\infty(B_{100}(x(i)))} \leq \Psi(\delta; n) \) and
\[
\frac{1}{v(B_{100}(x(i)))} \int_{B_{100}(x(i))} \left( |db_j^i - dr_{x_j(i)}|^2 + |Hess b_j^i|^2 \right) d\text{vol} \leq \Psi(\delta; n)
\]
for every \( j \in \{ 1, 3 \} \).

Since \( C(n) |\text{Hess} b_1|^2 + |\text{Hess} b_3|^2 \) is an upper gradient of \( \langle db_1^i, db_3^i \rangle \), by the Poincaré inequality, we have
\[
\frac{1}{v(B_{100}(x(i)))} \int_{B_{100}(x(i))} \left| \langle db_1^i, db_3^i \rangle - \frac{1}{v(B_{100}(x(i)))} \int_{B_{100}(x(i))} \langle db_1^i, db_3^i \rangle d\text{vol} \right| d\text{vol} \leq C(n) \sqrt{\frac{1}{v(B_{100}(x(i)))} \int_{B_{100}(x(i))} \left( |\text{Hess} b_1|^2 + |\text{Hess} b_3|^2 \right) d\text{vol} \leq \Psi(\delta; n)}.
\]
Therefore, we have
\[
\frac{1}{v(B_{100}(x(i)))} \int_{B_{100}(x(i))} \langle db_3^i, dr_{x_1(i)} \rangle - \frac{1}{v(B_{100}(x(i)))} \int_{B_{100}(x(i))} \langle db_3^i, dr_{x_1(i)} \rangle d\text{vol} \leq \Psi(\delta; n).
\]
Without loss of generality, we can assume that there exist Lipschitz functions \( b_1^\infty, b_3^\infty \) on \( B_{100}(x) \) such that \( b_j^i \to b_j^\infty \) on \( B_{100}(x) \). By Theorem 3.30, there exists a Borel subset \( A \) of \( B_{100}(x) \setminus C_x \) such that \( u(B_{100}(x) \setminus A) = 0 \) and \( \lim_{h \to 0} (f \circ \gamma(x_1, a + h) - f(a))/h = \langle dr_{x_1}, dB_3^\infty \rangle(a) \) for every \( a \in A \) and every minimal geodesic \( \gamma \) from \( x_1 \) to \( a \). By Lusin’s theorem, there exists a Borel subset \( A(\delta) \) of \( A \) such that \( u(A \setminus A(\delta)) < \delta u(B_1(x)) \) and that the function \( \langle dr_{x_1}, df \rangle \) is continuous on \( A(\delta) \). Define a function \( f_\eta^\delta \) on \( A(\delta) \setminus B_{2\delta}(x) \) by

\[
f_\eta^\delta(z) = \sup_{w \in C_x \setminus B_\eta(z)} \left| \frac{f(z) - f(w)}{z - w} \right| \langle dr_{x_1}, df \rangle(z)
\]

for every \( 0 < \eta < \delta \). It is easy to check that \( f_\eta^\delta \) is an upper semi-continuous function. Especially, \( f_\eta^\delta \) is a Borel function. We also have \( \lim_{\eta \to 0} f_\eta^\delta(a) = 0 \) for every \( a \in A \). Thus, by Egoroff’s theorem, there exists a Borel subset \( X = X(\delta) \) of \( A(\delta) \) such that \( u(A(\delta) \setminus X(\delta)) < \delta u(B_1(x)) \) and \( \lim_{\eta \to 0} (\sup_{a \in X} f_\eta^\delta(a)) = 0 \). Let \( \eta = \eta(\delta) \) be a positive number satisfying that \( \eta \ll \delta \), and \( \sup_{a \in X} f_\eta^\delta(a) < \delta \) for every \( \eta \leq \eta \). For every \( i \), let \( X_i \) be the set of points \( w \in B_1(x(i)) \) satisfying that

\[
|\langle dB_3^i, dr_{x_1(i)} \rangle(w) - \frac{1}{\operatorname{vol} B_{100}(x(i))} \int_{B_{100}(x(i))} \langle dB_3^i, dr_{x_1(i)} \rangle d\operatorname{vol}| \leq \Psi(\delta; n).
\]

Then, we have \( \operatorname{vol}(B_1(x(i)) \setminus X_i)/\operatorname{vol} B_1(x(i)) \leq \Psi(\delta; n) \) for every sufficiently large \( i \). Define a Borel function \( F_i \) on \( B_{100}(x(i)) \setminus C_{x_1(i)} \) by

\[
F_i(w) = \frac{b_3^i(\gamma(x_1(i), w - \eta^2)) - b_3^i(w)}{-\eta^2}
\]

for every \( i \), where \( \gamma \) is the minimal geodesic from \( x_1(i) \) to \( w \).

**Claim 3.34.** We have

\[
\frac{1}{\operatorname{vol} B_{10}(x(i))} \int_{B_{10}(x(i)) \setminus C_{x_1(i)}} |\langle dB_3^i, dr_{x_1(i)} \rangle - F_i(w)|| d\operatorname{vol} \leq \Psi(\delta; n)
\]

for every sufficiently large \( i \).

The proof is as follows. It is easy to check that

\[
f(t) = f(c) + f'(t)(t - c) - \int_c^t (s - c)f''(s)ds
\]

for every \( a < b \), every \( C^2 \)-function \( f \) on \( (a, b) \), and every \( c \in (a, b) \). Therefore, we have

\[
\frac{b_3^i(\gamma(x_1(i), w - \eta^2)) - b_3^i(w)}{-\eta^2} = \frac{dB_3^i(w)}{dr_{x_1(i)}} - \frac{1}{\eta^2} \int_{x_1(i), w - \eta^2}^{x_1(i), w} \left( s - \frac{(x_1(i), w - \eta^2)}{\eta^2} \right) \frac{d^2b_3^i}{dr_{x_1(i)}^2}(s)ds.
\]

27
Thus, by an argument similar to the proof of [21, Estimate 2.6], we have
\[
\frac{1}{\text{vol } B_{10}(x(i))} \int_{B_{10}(x(i)) \setminus C_{x_1(i)}} \left| \langle db_3^i, dr_{x_1(i)} \rangle - F_i(w) \right| d\text{vol} \\
\leq \frac{1}{\eta^2 \text{vol } B_{10}(x(i))} \int_{B_{10}(x(i))} \frac{1}{x_1(i), w} \left| \eta^2 |\text{Hess}_{b_3^i}|(\gamma(s)) ds d\text{vol} \right| \\
\leq \eta^2 C(n) \frac{1}{\text{vol } B_{100}(x(i))} \int_{B_{100}(x(i))} |\text{Hess}_{b_3^i}| d\text{vol} \\
\leq \eta^2 C(n) \sqrt{\frac{1}{\text{vol } B_{100}(x(i))} \int_{B_{100}(x(i))} |\text{Hess}_{b_3^i}|^2 d\text{vol} \leq \eta^2 C(n) \Psi(\delta; n)}.
\]

Therefore, we have Claim 3.34

**Claim 3.35.** We have
\[
\frac{1}{v(B_1(x))} \int_{B_1(x)} \left| \langle db_3^\infty, dr_{x_1} \rangle - \frac{1}{\text{vol } B_1(x(i))} \int_{B_1(x(i))} \langle db_3^i, dr_{x_1(i)} \rangle d\text{vol} \right| dv \leq \Psi(\delta; n)
\]
for sufficiently large $i$.

The proof is as follows. Let $Y_i = \{ w \in \overline{B}_1(x(i)) \setminus C_{x_1(i)}; |\langle db_3^i, dr_{x_1(i)} \rangle(w) - F_i(w) | \leq \Psi(\delta; n) \}$. By Claim 3.34, we have $v(\overline{B}_1(x(i)) \setminus Y_i)/v(\overline{B}_1(x(i)) \leq \Psi(\delta; n)$ for every sufficiently large $i$. Put $Z_i = X_i \cap Y_i$. There exists a compact subset $W_i$ of $Z_i$ such that $v(Z_i \setminus W_i)/v(\overline{B}_1(x(i)) \leq \Psi(\delta; n)$. Then, we have $v(\overline{B}_1(x(i)) \setminus W_i)/v(\overline{B}_1(x(i)) \leq \Psi(\delta; n)$ for every sufficiently large $i$. Without loss of generality, we can assume that there exists a compact subset $W_{\infty}$ of $\overline{B}_1(x)$ such that $W_j \to W_{\infty}$. By Lemma 2.5, we have $v(W_{\infty})/v(\overline{B}_1(x)) \geq 1 - \Psi(\delta; n)$. Put $E = W_{\infty} \cap X$. Then we have $v(\overline{B}_1(x) \setminus E) \leq \Psi(\delta; n)v(\overline{B}_1(x))$. For every $w_i \in W_i$ and every $w \in E$, let $\gamma_{w_i}$ be the minimal geodesic from $x_1(i)$ to $w_i$, and $\gamma_w$ a minimal geodesic from $x_1$ to $w$. Then, there exists $i_0$ such that
\[
\epsilon_i << \eta, \quad \left| \langle db_3^i, dr_{x_1(i)} \rangle(w) - \frac{b_3^i(\gamma_i(x_1(i), w_i - \eta^2)) - b_3^i(w_i)}{-\eta^2} \right| \leq \Psi(\delta; n)
\]
and
\[
\left| \langle db_3^i, dr_{x_1(i)} \rangle(w_i) - \frac{1}{\text{vol } B_{100}(x(i))} \int_{B_{100}(x(i))} \langle db_3^i, dr_{x_1(i)} \rangle d\text{vol} \right| \leq \Psi(\delta; n)
\]
for every $i \geq i_0$, every $w \in E$ and every $w_i \in W_i$ with $w_i \to w$. Now, we shall consider the rescaled metric $\eta^{-2}dy$. Since
\[
\frac{1}{x_1, \phi_i(\gamma_i(x_1(i), w_i - \eta^2))} \eta^{-2}dy \geq \eta^{-1}, \quad \phi_i(\gamma_i(x_1(i), w_i - \eta^2)), w \eta^{-2}dy \geq \eta^{-1}
\]
and
\[
\frac{1}{x_1, \phi_i(\gamma_i(x_1(i), w_i - \eta^2))} \eta^{-2}dy + \phi_i(\gamma_i(x_1(i), w_i - \eta^2)), w \eta^{-2}dy - x_1, w \eta^{-2}dy \leq \eta,
\]
28
by the splitting theorem on limit spaces, we have
\[ \phi_i(\gamma_i(x_1(i), w_i - \eta^2)), \gamma(x_1, w - \eta^2) \leq \Psi(\delta; n). \]

Therefore, we have
\[ \left| \frac{b^i_3(\gamma_i(x_1(i), w_i - \eta^2)) - b^i_3(w_i)}{-\eta^2} - \frac{b^\infty_3(\gamma(x_1, w - \eta^2)) - b^\infty_3(w)}{-\eta^2} \right| \leq \Psi(\delta; n). \]

Thus, for every \( i \geq i_0 \), we have
\[ \langle dB^\infty_3, dr_{x_1} \rangle(w) \leq \Psi(\delta; n). \]

Let
\[ C_i = \frac{1}{\text{vol } B_{100}(x(i))} \int_{B_{100}(x(i))} \langle dB^i_3, dr_{x_1} \rangle \text{dvol}. \]

Then
\[ \frac{1}{\text{vol } B_1(x(i))} \int_{B_1(x(i))} |\langle dB^\infty_3, dr_{x_1} \rangle - C_i| \text{dvol} \]
\[ = \frac{1}{\text{vol } B_1(x(i))} \int_{B_1(x(i)) \setminus E} |\langle dB^\infty_3, dr_{x_1} \rangle - C_i| \text{dvol} + \frac{1}{\text{vol } B_1(x(i))} \int_E |\langle dB^\infty_3, dr_{x_1} \rangle - C_i| \text{dvol} \]
\[ \leq \frac{C(n) \text{vol } B_1(x(i))}{\text{vol } B_1(x(i))} + \frac{\text{vol } E}{\text{vol } B_1(x(i))} \Psi(\delta; n) \leq \Psi(\delta; n). \]

Therefore, we have Claim 3.35.

**Claim 3.36.** We have
\[ \frac{1}{\text{vol } B_1(x(i))} \int_{B_1(x(i))} |dB^\infty_3|^2 \text{dvol} \leq 1 + \Psi(\delta; n). \]

This proof is as follows. Since
\[ \frac{1}{\text{vol } B_1(x(i))} \int_{B_1(x(i))} |dB^i_3| - 1| \text{dvol} \leq \Psi(\delta; n) \]
for every sufficiently large \( i \), by [1, Lemma 16.2], there exists a compact subset \( K_i \) of \( \overline{B}_1(x(i)) \) such that \( \text{vol}(B_1(x(i)) \setminus K_i) / \text{vol } B_1(x(i)) \leq \Psi(\delta; n) \) and \( \text{Lip}(b^i_3|_{K_i}) \leq 1 + \Psi(\delta; n) \).

Without loss of generality, we can assume that there exists a compact subset \( K_\infty \) of \( \overline{B}_1(x(i)) \) such that \( K_i \to K_\infty \). By Lemma 2.5, we have \( v(K_\infty) / v(B_1(x(i)) \geq 1 - \Psi(\delta; n) \). Then, we
have $\text{Lip}(b^\infty_3|_{K_\infty}) \leq 1 + \Psi(\delta; n)$. Put $K_\infty = \text{Leb}K_\infty$. Then by Lemma 3.20, we have

$$\frac{1}{v(B_1(x))} \int_{B_1(x)} |db^\infty_3|^2 dv = \frac{1}{v(B_1(x))} \int_{K_\infty} |db^\infty_3|^2 dv + \frac{1}{v(B_1(x))} \int_{B_1(x) \setminus K_\infty} |db^\infty_3|^2 dv$$

$$\leq \frac{1}{v(B_1(x))} \int_{K_\infty} (\text{Lip}b^\infty_3)^2 dv + C(n) \frac{v(B_1(x) \setminus K_\infty)}{v(B_1(x))}$$

$$\leq \frac{1}{v(B_1(x))} \int_{K_\infty} (\text{Lip}(b^\infty_3|_{K_\infty}))^2 dv + \Psi(\delta; n)$$

$$\leq \frac{1}{v(B_1(x))} \int_{K_\infty} (1 + \Psi(\delta; n)) dv + \Psi(\delta; n) \leq 1 + \Psi(\delta; n).$$

Therefore, we have Claim 3.36.

Assume that $x_1 = x_3$ and $x_2 = x_4$. Then, by Claim 3.33, 3.35 and 3.36, we have

$$\frac{1}{v(B_1(x))} \int_{B_1(x)} |db^\infty_3 - dr_{x_3}|^2 dv$$

$$= \frac{1}{v(B_1(x))} \int_{B_1(x)} |db^\infty_3|^2 dv - \frac{1}{v(B_1(x))} \int_{B_1(x)} \langle db^\infty_3, dr_{x_3} \rangle dv + \frac{1}{v(B_1(x))} \int_{B_1(x)} |dr_{x_3}|^2 dv$$

$$\leq 1 + \Psi(\delta; n) - 2(1 - \Psi(\delta; n)) + 1 \leq \Psi(\delta; n)$$

for every sufficiently large $i$. Therefore, we have Lemma 3.31. On the other hand, Lemma 3.32 follows from Lemma 3.31 and Claim 3.35, directly.

**Corollary 3.37.** Let $\{(M_i,m_i)\}_i$ be a sequence of $n$-dimensional complete Riemannian manifolds with $\text{Ric}_{M_i} \geq -(n - 1), (Y,y,v)$ a Ricci limit space of $\{(M_i,m_i,\text{vol})\}_i$, $\tau$ a positive number, $x,x_1,x_2$ points in $Y$, $\{x(i)\}_i, \{x_1(i)\}_i, \{x_2(i)\}_i$ sequences of points $x(i),x_1(i),x_2(i)$ in $M_i$. Assume that $x \in \bigcap_{j=1,2}(D^\tau_{x(j)} \setminus B_r(x(j))), x(i) \to x$, and $x_j(i) \to x_j$ for every $j$. Then, we have

$$\frac{1}{v(B_r(x))} \int_{B_r(x)} \langle dr_{x_1}, dr_{x_2} \rangle - \frac{1}{\text{vol}B_r(x(i))} \int_{B_r(x(i))} \langle dr_{x_1(i)}, dr_{x_2(i)} \rangle d\text{vol} \leq \Psi \left( r, \frac{r}{\tau}; n \right)$$

and

$$\frac{1}{\text{vol}B_r(x(i))} \int_{B_r(x(i))} \langle dr_{x_1(i)}, dr_{x_2(i)} \rangle - \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle dr_{x_1}, dr_{x_2} \rangle d\text{vol} \leq \Psi \left( r, \frac{r}{\tau}; n \right)$$

for every sufficiently large $i$.

**Proof.** By rescaling $r^{-1}d_Y$, and Lemma 3.32, it is easy to check the assertion.

**Lemma 3.38.** Let $\{(M_i,m_i)\}_i$ be a sequence of $n$-dimensional complete Riemannian manifolds with $\text{Ric}_{M_i} \geq -(n - 1), (Y,y,v)$ a Ricci limit space of $\{(M_i,m_i,\text{vol})\}_i$, $l$ a positive integer, $r, \varepsilon, \tau, L$ positive real numbers, $x$ a point in $Y$, $\{x(i)\}_i$ a sequence of
Lemma 9 For every sufficiently large \( i \), there exists a compact subset \( K_i^r \) of \( B_{r/10}(x(i)) \) such that the following properties hold:

1. \( \vol(B_{r/10}(x(i)) \setminus K_i^r) / \vol B_{r/10}(x(i)) \leq \Psi(r, r/\tau, \epsilon; n, L) \).

2. For every \( w \in K_i^r \) and every \( 0 < s < r/10^6 \), there exist a compact subset \( Z \) of \( B_s(w) \), a point \( z \) in \( Z \), and a map \( \phi \) from \( B_s(w) \) to \( (Z, z) \) such that the map \( \Phi = (f_1, f_2, \ldots, f_i, \phi) \) from \( B_s(w) \) to \( B_s+\Psi(r, r/\tau, \epsilon; n, L) s \cdot Gromov-Hausdorff \) approximation.

3. We have

\[
\frac{1}{\vol B_s(w)} \int_{B_s(w)} |\langle df_1^i, df_2^i \rangle - \delta_{i,j}| \, d\vol < \Psi \left( r, \frac{r}{\tau}, \epsilon; n, L \right)
\]

for every \( w \in K_i^r \) and every \( 0 < s < r/10^6 \).

**Proof.** By Corollary 3.37, we have

\[
\frac{1}{\vol B_s(x(i))} \int_{B_s(x(i))} |\langle df_1^i, df_2^i \rangle - \delta_{i,j}| \, d\vol \leq \Psi \left( r, \frac{r}{\tau}, \epsilon; n, L \right)
\]

for every sufficiently large \( i \). We shall consider rescaled distances \( r^{-1}d_Y \) and \( r^{-1}d_M \) below. For convenience, we shall use the following notations: \( \tilde{v} = \vol r^{-1}d_M \), \( \tilde{\nu} = \nu / \vol(B_r(y)) \), \( \tilde{r}_z(w) = r^{-1}d_Y(w, z) \cdot B_s(w) = B_s + \Psi(r, r/\tau, \epsilon; n, L) s \cdot Gromov-Hausdorff \) approximation. We remark that \((M, m, r^{-1}d_M, \vol r^{-1}d_M) \rightarrow (Y, y, r^{-1}d_Y, \tilde{\nu})\). We also denote the differential of a Lipschitz function \( f \) on \( Y \) as a metric measure space \((Y, \tilde{\nu})\) by \( \tilde{f} : Y \rightarrow T^*Y \), and the Riemannian metric of rescaled Ricci limit space \((Y, y, r^{-1}d_Y, \tilde{\nu})\) by \( \langle \cdot, \cdot \rangle_{r} \). Thus, we have \( \langle \cdot, \cdot \rangle = r^{-2} \langle \cdot, \cdot \rangle_{r} \). Then we have

\[
\frac{1}{\vol B_1(x(i))} \int_{B_1(x(i))} |\langle \tilde{d}_f, \tilde{d}_{f_1} \rangle_r - \delta_{i,j}| \, d\tilde{\vol} \leq \Psi \left( r, \frac{r}{\tau}, \epsilon; n, L \right)
\]

for every sufficiently large \( i \). On the other hand, by [2, Lemma 9.8], [2, Lemma 9.10], [2, Lemma 9.13], for every sufficiently large \( i \), there exists a collection of harmonic functions \( \{\tilde{B}_{y_{m,i}}^{m,i} \}_{1 \leq m \leq l, 1 \leq i \leq k_m} \) on \( B_{100}(x(i)) \) such that \( |\tilde{B}_{y_{m,i}}^{m,i} - \tilde{r}_x x_{x(i)}^p|_{L^\infty(B_{100}(x(i)))} \leq \Psi(r, r/\tau; n) \) and

\[
\frac{1}{\vol B_{100}(x(i))} \int_{B_{100}(x(i))} \left( |\tilde{B}_{y_{m,i}}^{m,i} - \tilde{r}_x x_{x(i)}^p|_r^2 \right) \, d\tilde{\vol} \leq \Psi \left( r, \frac{r}{\tau}; n \right).
\]
Let $\hat{b}_j = \sum_{m=1}^{k_j} a_m \hat{b}_j^{m,i}$.

$$\hat{F}_i = \sum_{j=1}^{l} |d\hat{b}_j - \hat{d}f_j|^2 + \sum_{j=1}^{l} \frac{1}{r} |d\hat{b}_j|^2 - 1 + \sum_{j<l} \frac{1}{r} |\langle d\hat{b}_j, \hat{d}f_j \rangle| + \sum_{j=1}^{l} |\text{Hess}_{b_j}|^2.$$

The next claim follows from Lemma 3.1, directly:

**Claim 3.39.** For every sufficiently large $i$, there exists a compact subset $K_i$ of $\hat{B}_{1/10}(x(i))$ such that $\nu(\hat{B}_{1/11}(x(i)) \setminus K_i)/\nu(\hat{B}_{1/11}(x(i))) \leq \Psi(r, r/\tau, \epsilon; n, L)$ and

$$\frac{1}{\nu(\hat{B}_{5s}(w))} \int_{\hat{B}_{5n}(w)} \hat{F}_i d\nu \leq \Psi(\hat{r}, r/\tau, \epsilon; n, L)$$

for every $w \in K_i$ and every $0 < s < 1/10$.

Fix $w \in K_i$ and $0 < s \leq 1/10$. By an argument same to the proof of [6, Theorem 3.3], we have the following:

**Claim 3.40.** There exist a compact subset $Z$ of $\hat{B}_{s}(w)$, a point $z$ in $Z$ and a map $\phi$ from $\hat{B}_{s/10^5}(w)$ to $Z$ such that the map $\Phi(\alpha) = (\hat{b}_1(\alpha), \ldots, \hat{b}_l(\alpha), \phi(\alpha))$ from $\hat{B}_{s/10^5}(w)$ to $\hat{B}_{s/10^5} \cup \Psi_s(\hat{b}_1(w), \ldots, \hat{b}_l(w), \phi(w)) \subset \mathbb{R}^k \times Z$, is an $\Psi_s$-Gromov-Hausdorff approximation. Here, $\Psi = \Psi(r, r/\tau, \epsilon; n, L)$.

Since

$$\frac{1}{\nu(\hat{B}_{5s}(w))} \int_{\hat{B}_{5n}(w)} |\hat{d}\hat{b}_j - \hat{d}f_j|^2 d\nu \leq \Psi(\hat{r}, r/\tau, \epsilon; n, L),$$

by the segment inequality on manifolds [6, Theorem 2.15], for every $z_1 \in \hat{B}_{s}(w)$, there exist $\hat{z}_1 \in \hat{B}_{s}(w)$, $\hat{w} \in \hat{B}_{5n}(w)$ and a minimal geodesic $\gamma$ from $\hat{z}_1$ to $\hat{w}$ such that $\bar{z}_1 \leq \Psi(r, r/\tau, \epsilon; n, L)$ and

$$\int_{0}^{\bar{z}_1, \hat{w}} \text{Lip}(\hat{b}_j - \hat{f}_j)(\gamma(t)) dt \leq \Psi(\hat{r}, r/\tau, \epsilon; n, L) s.$$

Therefore, we have

$$|\hat{b}_j(\hat{z}_1) - \hat{f}_j(\hat{z}_1) - (\hat{b}_j(\hat{w}) - \hat{f}_j(\hat{w}))| \leq \int_{0}^{\bar{z}_1, \hat{w}} \text{Lip}(\hat{b}_j - \hat{f}_j)(\gamma(t)) dt \leq \Psi(\hat{r}, r/\tau, \epsilon; n, L) s.$$

By Cheng-Yau’s gradient estimate, we have $\text{Lip}(\hat{b}_j|_{\hat{B}_{2n}(w)}) \leq C(n, L)$. Thus, we have $|\hat{b}_j(z_1) - \hat{f}_j(z_1) - (\hat{b}_j(w) - \hat{f}_j(w))| \leq \Psi(r, r/\tau, \epsilon; n, L)s$. Let $C = \hat{b}_j(w) - \hat{f}_j(w)$. Then we have that $\hat{b}_j = \hat{f}_j + C \pm \Psi(r, r/\tau, \epsilon; n, L) s$ on $\hat{B}_{s}(w)$.

Thus, the map $\Phi(\alpha) = (\hat{f}_1(\alpha), \ldots, \hat{f}_l(\alpha), \phi(\alpha))$ from $\hat{B}_{s/10^5}(w)$ to $\hat{B}_{s/10^5} \cup \Psi_s(\hat{f}_1(w), \ldots, \hat{f}_l(w), \phi(w))$, is an $\Psi_s$-Gromov-Hausdorff approximation. Therefore we have the assertion. □
Lemma 3.41. Let \((Y, y, v)\) be a Ricci limit space, \(\tau, \epsilon, \delta, L\) positive numbers, \(l, m\) positive integers, \(x\) a point in \(Y\), \(\{k_s\}_{1 \leq s \leq l}\) a collection of positive integers, \(\{a^s_i\}_{1 \leq s, l \leq k_s}\) of real numbers, and \(\{x^s_j\}_{1 \leq s, l \leq k_s}\) of points in \(Y\). Let \(f_j = \sum_{i=1}^{k_j} a^s_i r_{x^j_i}\). Assume that \(x \in \text{Leb}(\bigcap_{1 \leq i \leq l, 1 \leq j \leq k_i} (D^s_{x^j_i} \setminus \{x^j_i\}) \cap (R_m)_{\delta, \tau})\), \(\sum_{j, i} (a^s_i)^2 \leq L\) and
\[
\limsup_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} |\langle df_j, df_i \rangle - \delta_{ij}| dv \leq \epsilon.
\]
Then, for every sufficiently small \(s > 0\), there exists a compact subset \(K_s\) of \(\overline{B}_s(x)\) such that the following properties hold:

1. \(v(K_s) / v(B_s(x)) \geq 1 - \Psi(\epsilon, \delta; n, L)\).

2. For every \(\alpha \in K_s\) and every sufficiently small \(t > 0\), there exist a collection of points \(\{w^t_j(\alpha)\}_{1 \leq j \leq m-1}\) in \(Y\), and a compact subset \(U_t\) of \(\overline{B}_t(\alpha)\) such that \(v(U_t) / v(B_t(\alpha)) \geq 1 - \Psi(\epsilon, \delta; n, L)\) and that the map \(\Phi_t = (f_1, \ldots, f_t, r_{w^t_1(\alpha)}, \ldots, r_{w^t_m(\alpha)})\) from \(U_t\) to \(\mathbb{R}^m\), is \((1 \pm \Psi(\epsilon, \delta; n, L))\)-bi-Lipschitz to the image.

Proof. Let \((M_i, m_i, x^*_i, \text{vol})\) \to \((Y, y, x^*_i, v)\) and \(f^*_j = \sum_{i=1}^{k_j} a^*_i r_{x^*_i(j)}\). There exists \(s_1 > 0\) such that \(s_1 < < \tau\) and
\[
\frac{1}{v(B_{10^{10} s}(x))} \int_{B_{10^{10} s}(x)} |\langle df_j, df^*_i \rangle - \delta_{ij}| dv + \frac{v(B_{10^{10} s}(x)) \cap \bigcap_{1 \leq i \leq l, 1 \leq j \leq k_i} (D^s_{x^*_i(j)} \cap (R_m)_{\delta, \tau})}{v(B_{10^{10} s}(x))} \leq 3\epsilon
\]
for every \(0 < s < s_1\). By Proposition 2.5 and Lemma 3.38, for every \(0 < s < s_1\), there exists a compact subset \(K_s\) of \(\overline{B}_{10^{10} s}(x)\) such that the following properties hold:

1. \(v(K_s) / v(B_{10^{10} s}(x)) \geq 1 - \Psi(\epsilon; n, L)\).

2. For every \(w \in K_s\) and every \(0 < t < 10^4 s\), there exist a compact subset \(Z^w_t\) of \(\overline{B}_t(w)\) and a map \(\phi^w_t\) from \(\overline{B}_t(w)\) to \(\overline{B}_{10^{10} (1 + \Psi)}(f_1(w), \ldots, f_t(w), \phi^w_t(w))\), is a \(\Psi t\)-Gromov-Hausdorff approximation. Here \(\Psi = \Psi(\epsilon; n, L)\).

3. We have
\[
\frac{1}{v(B_t(w))} \int_{B_t(w)} |\langle df_j, df^*_i \rangle - \delta_{ij}| dv \leq \Psi(\epsilon; n, L)
\]
for every \(w \in K_s\) and every \(0 < t < 10^4 s\).

Here, with the same notation as in Lemma 3.38, we applied Proposition 4.12 to get
\[
\lim_{k \to \infty} \frac{1}{\text{vol} B_t(w(k))} \int_{B_t(w(k))} |\langle df^k_j, df^k_i \rangle - \delta_{ij}| dv = \frac{1}{v(B_t(w))} \int_{B_t(w)} |\langle df_j, df^*_i \rangle - \delta_{ij}| dv
\]
for every sequence \( w(k) \to w \). Fix \( 0 < s < s_1, w \in K_{s} \cap \text{Leb}(\bigcap_{1 \leq i \leq l, 1 \leq j \leq k_i} (D^r_{x^i_j} \setminus \{x^i_j\}) \cap (R_m)_{\delta t}, 0 < t < 10^4 s, Z^w_t, \phi^w_t, \) and \( \Phi^w_t \) as above. We remark that \( v(K_{s} \cap \text{Leb}(\bigcap_{1 \leq i \leq l, 1 \leq j \leq k_i} (D^r_{x^i_j} \setminus \{x^i_j\}) \cap (R_m)_{\delta t})) / v(B_{10^4 s}(x)) \geq 1 - \Psi(\epsilon; n, L) \). Assume that \( t \) is sufficiently small and

\[
\frac{v(B_{t}(w) \cap \bigcap_{1 \leq i \leq l, 1 \leq j \leq k_i} (D^r_{x^i_j} \setminus \{x^i_j\}) \cap (R_m)_{\delta t})}{v(B_{t}(w))} \geq 1 - \epsilon
\]

for every \( 0 < t \leq t \), below. Then, for every \( 1 \leq j \leq l \), there exist points \( y^-_j, y^+_j \in B_{t}(w) \) such that \( \Phi^w_t(y^+_j), (0, \ldots, 0, t, 0, \ldots, 0, \phi^w_t(y^+_j)) \leq \Psi t \) and \( \Phi^w_t(y^-_j), (0, \ldots, 0, -t, 0, \ldots, 0, \phi^w_t(y^-_j)) \leq \Psi t \). Let \( \Phi^w_t \) be an \( \Psi t \)-Gromov-Hausdorff approximation from \( B_{10^4(t+\Psi t)}(f_1(w), \ldots, f_l(w), \phi^w_t(w)) \) to \( B_{t}(w) \) satisfying that \( \Phi^w_t \circ \Phi^w_t(\alpha), \alpha \leq \Psi t \) for every \( \alpha \in B_{10^4(t+\Psi t)}(f_1(w), \ldots, f_l(w), \phi^w_t(w)) \), and that \( \Phi^w_t \circ \Phi^w_t(\beta), \beta \leq \Psi t \) for every \( \beta \in B_{t}(w) \). On the other hand, there exist \( \delta t \)-Gromov-Hausdorff approximations \( \psi^w_t \) from \( (B_{t}(w), w) \) to \( (B_{t}(0, m), 0, m)_t \), and \( \hat{\psi}^w_t \) from \( (B_{t}(0, m), 0, m)_t \) to \( (B_{t}(w), w) \) such that \( \psi^w_t \circ \psi^w_t(\alpha), \alpha \leq 5\delta t \) for every \( \alpha \in B_{t}(0, m)_t \), and that \( \hat{\psi}^w_t \circ \psi^w_t(\beta), \beta \leq 5\delta t \) for every \( \beta \in B_{t}(w) \). Especially, there exists an \( \Psi t \)-Gromov-Hausdorff approximation \( \hat{h}^w_t \) from \( (B_{t}(0, m-1), 0, m-1)_t \) to \( (Z^w_t, \phi^w_t(w)) \) such that \( (0, \ldots, 0, \alpha), \psi^w_t \circ \Phi^w_t(\alpha) \leq \Psi t \) for every \( \alpha \in Z^w_t \), where \( \Psi = \Psi(\epsilon, \delta; n, L) \). Without loss of generality, we can assume that \( \hat{\psi}^w_t(y^+_j), (0, \ldots, 0, t, 0, \ldots, 0) \leq \Psi t \). Then, for every \( i \in \{l+1, \ldots, m\} \), there exist points \( z^+_i, z^-_i \in B_{t}(w) \) such that \( \hat{\psi}^w_t(z^+_i), (0, \ldots, 0, t, 0, \ldots, 0) \leq \Psi t \) and \( \hat{\psi}^w_t(z^-_i), (0, \ldots, 0, -t, 0, \ldots, 0) \leq \Psi t \). Let \( F_i = f_i - f_i(w) \) and \( G_i = F_i \circ \psi^w_t \) on \( (B_{t}(0, m), 0, m)_t \). Since \( \pi_{R^m-i} \circ \hat{\psi}^w_t(\psi^w_t(\alpha)) \leq \Psi t \) for every \( \alpha \in B_{t}(0, m-1)_t \), we have that the map \( G = (G_1, \ldots, G_l, \pi_{l+1}, \ldots, \pi_m) \) from \( (B_{t}(0, m), 0, m)_t \) to \( (B_{t+l}(0, m), 0, m)_t \), satisfies \( G((0, \ldots, 0, \pm t, 0, \ldots, 0), (0, \ldots, 0, \pm t, 0, \ldots, 0) \leq \Psi t \) for every \( i \), and that it is an \( \Psi t \)-Gromov-Hausdorff approximation, where \( \pi_{R^m-i} \) is the canonical projection \( R^m = R^l \times R^{m-l} \) to \( R^{m-l} \), \( \pi_i \) is the \( i \)-th projection from \( R^m \) to \( R \). Thus, we have \( \alpha, G(\alpha) \leq \Psi t \) for every \( \alpha \in B_{t}(0, m)_t \). Especially, we have the following claim:

**Claim 3.42.** We have \( |G_i - \pi_i| \leq \Psi(\epsilon, \delta; n, L) t \) on \( B_{t}(0, m)_t \).

Fix \( 0 < \hat{t} < t \). By rescaling \( \hat{t}^{-1} d_Y, \hat{t}^{-1} d_{R^m} \), Claim 3.42 and the definition of Busemann function, we have the following:

**Claim 3.43.** We have

\[
|F_i(\alpha) - (r_{y^-_i}(\alpha) - r_{y^-_i}(w))| \leq \Psi \left( \epsilon, \delta, \hat{t}^{-1} \frac{\Psi(\epsilon, \delta; n, L)t}{\hat{t}}; n, L \right) \hat{t}
\]
for every $\alpha \in \mathcal{B}_i(w)$.

Let $y^*_j(k), z^*_j(k), w(k)$ be points in $M_k$ satisfying that $y^*_j(k) \rightarrow y^*_j, z^*_j(k) \rightarrow z^*_j$ and $w(k) \rightarrow w$. Put $r = \sqrt{\Psi}$ for $\Psi = \Psi(\epsilon, \delta; n, L)$ as in Claim 3.43. For convenience, for rescaled distances $r^{-1}d_Y$ and $r^{-1}d_M$, we shall use the same notation as in the proof of Lemma 3.38: $\hat{f}_i^k, \hat{d}f, \hat{\nu}, \hat{\nu}$, and so on.

**Claim 3.44.** We have
\[
\frac{1}{\text{vol } B_{100}(w(k))} \int_{B_{100}(w(k))} |\hat{d}\hat{f}_i^k - \hat{d}\hat{r}_{y^*_i(k)}|^2 \hat{d}\nu \leq \Psi(\epsilon, \delta; n, L)
\]
for every sufficiently large $k$.

The proof is as follows. By the assumption and Proposition 4.12, we have
\[
\frac{1}{\text{vol } B_{1000}(x(k))} \int_{B_{1000}(x(k))} ||\hat{d}\hat{f}_i^k||^2 - 1|\hat{d}\nu \leq \Psi(\epsilon, \delta; n, L)
\]
for every sufficiently large $k$. By an argument similar to the proof of Lemma 3.38, for every sufficiently large $k$, there exists a harmonic function $\hat{b}_i^k$ on $\hat{B}_{100}(w(k))$ such that $\text{Lip } \hat{b}_i^k \leq C(n), |\hat{b}_i^k - \hat{f}_i^k|_{L^\infty(\hat{B}_{100}(w(k)))} \leq \Psi(r, r/\tau; n, L)$ and
\[
\frac{1}{\text{vol } B_{1000}(w(k))} \int_{B_{1000}(w(k))} (\hat{d}\hat{b}_i^k - \hat{d}\hat{f}_i^k||^2 + |\text{Hess } \hat{b}_i^k||^2) \hat{d}\nu \leq \Psi(r, r/\tau; n, L).
\]
For every $\alpha \in \hat{B}_{1000}(w(k)) \setminus C_{y^*_i(k)}$, let $\gamma^\alpha$ be the minimal geodesic from $y^*_i(k)$ to $\alpha$ on $(M_i, r^{-1}d_M)$. Fix $0 < h < 1$. By Claim 3.43, there exists $k_0$ such that
\[
\begin{align*}
\hat{b}_i^k(\alpha) - \hat{b}_i^k\left(\gamma^\alpha(\hat{y}^-_i(k), \alpha r^{-1}d_M - h)\right) & = \frac{\hat{f}_i^k(\alpha) - \hat{f}_i^k\left(\gamma^\alpha\left(\hat{y}^-_i(k), \alpha r^{-1}d_M - h\right)\right)}{h} + \Psi(\epsilon, \delta; n, L) \\
& = \frac{\hat{f}_i^k(\phi_k(\alpha)) - \hat{f}_i\left(\phi_k\left(\gamma^\alpha\left(\hat{y}^-_i(k), \alpha r^{-1}d_M - h\right)\right)\right)}{h} + \Psi(\epsilon, \delta; n, L) \\
& = \frac{\hat{y}^-_i(\alpha) r^{-1}d_Y - \hat{y}^-_i(\alpha) \gamma^\alpha\left(\hat{y}^-_i(k), \alpha r^{-1}d_M - h\right)}{h} \pm \frac{\Psi(\epsilon, \delta; n, L)}{h} \\
& = \frac{\hat{y}^-_i(\alpha) r^{-1}d_M - \hat{y}^-_i(\alpha) \gamma^\alpha\left(\hat{y}^-_i(k), \alpha r^{-1}d_M - h\right)}{h} \pm \frac{\Psi(\epsilon, \delta; n, L)}{h} \\
& = 1 \pm \frac{\Psi(\epsilon, \delta; n, L)}{h}
\end{align*}
\]
for every \( k \geq k_0 \) and every \( \alpha \in \hat{B}_{100}(w(k)) \setminus C_{y_i^-}(k) \). On the other hand, by an argument similar to the proof of Claim 3.34, we have

\[
\left| \frac{1}{\text{vol } \hat{B}_{100}(w(k))} \int_{\hat{B}_{100}(w(k))} \frac{1}{h} \int_{\hat{y}_i^-(k),\alpha}^{r^{-1}dM_k - h} \left(s - \frac{r^{-1}dM_k - h}{\alpha} \right) \frac{d^2 \hat{b}^k_i \circ \gamma^\alpha}{ds^2} ds d\hat{v} \right|
\leq C(n) \frac{h}{\text{vol } \hat{B}_{100}(w(k))} \int_{\hat{B}_{100}(w(k))} |\text{Hess}_{\hat{b}^k_i}|, d\hat{v} \leq \Psi(\epsilon, \delta; n, L).
\]

Since

\[
\hat{b}^k_i(\alpha) = \hat{b}^k_i(\gamma^\alpha_i(y_i^-(k),\alpha r^{-1}dM_k - h)) + \frac{d\hat{b}^k_i}{d\hat{y}_i^-}(\alpha) h - \int_{\hat{y}_i^-(k),\alpha}^{r^{-1}dM_k - h} \left(s - \frac{r^{-1}dM_k - h}{\alpha} \right) \frac{d^2 \hat{b}^k_i \circ \gamma^\alpha_i}{ds^2} ds
\]

for every \( \alpha \in \hat{B}_{100}(w(k)) \setminus C_{y_i^-}(k) \), we have

\[
\left| \frac{1}{\text{vol } \hat{B}_{100}(w(k))} \int_{\hat{B}_{100}(w(k))} \langle \hat{d}\hat{b}^k_i, \hat{d}\hat{y}_i^- \rangle, d\hat{v} \right| = 1 \pm \frac{\Psi(\epsilon, \delta; n, L)}{h}.
\]

Therefore, we have

\[
\frac{1}{\text{vol } \hat{B}_{100}(w(k))} \int_{\hat{B}_{100}(w(k))} |\hat{d}\hat{f}^k_i - \hat{d}\hat{y}_i^-|^2 d\hat{v} \leq 1 - 2 \left( 1 \pm \frac{\Psi(\epsilon, \delta; n, L)}{h} \right) \leq \frac{\Psi(\epsilon, \delta; n, L)}{h}.
\]

Therefore, we have Claim 3.44.

Next claim follows from Claim 3.44 and [2, Theorem 9.29] directly:

**CLAIM 3.45.** For every sufficiently large \( k \), we have

\[
\frac{1}{\text{vol } \hat{B}_{100}(w(k))} \int_{\hat{B}_{1}(w(k))} |\langle \hat{d}\hat{f}^k_i, \hat{d}\hat{z}_i^- \rangle| d\hat{v} \leq \Psi(\epsilon, \delta; n, L)
\]

for every \( 1 \leq i \leq l \) and every \( l + 1 \leq j \leq m \). Moreover we have

\[
\frac{1}{\text{vol } \hat{B}_{100}(w(k))} \int_{\hat{B}_{1}(w(k))} |\langle \hat{d}\hat{f}^k_i, \hat{d}\hat{f}^k_{\hat{i}} \rangle| d\hat{v} \leq \Psi(\epsilon, \delta; n, L)
\]

for every \( 1 \leq i \leq \hat{i} \leq l \).
For every \( i \) with \( l + 1 \leq i \leq m \), and every sufficiently large \( k \), there exists a harmonic function \( \hat{b}_i^k \) on \( \hat{B}_{1000}(w(k)) \) such that 
\[
\frac{1}{\text{vol} \hat{B}_{1000}(w(k))} \int_{\hat{B}_{1000}(w(k))} \left( |\hat{d}\hat{b}_i^k|_{L^\infty}^2 + |\text{Hess}\hat{b}_i^k|^2_{L^1} \right) \, d\text{vol} \leq \Psi(\epsilon, \delta; n, L).
\]

Let
\[
\hat{F}_k = \sum_{1 \leq i,j \leq m} |\langle \hat{d}\hat{b}_i^k, \hat{d}\hat{b}_j^k \rangle_r - \delta_{i,j}| + \sum_{1 \leq i \leq m} |\text{Hess}\hat{b}_i^k|^2_{L^1} + \sum_{l=1}^i |\hat{d}\hat{b}_i^k - \hat{d}\hat{r}_{z_i^-(k)}|^2_{L^1} + \sum_{i=l+1}^m |\hat{d}\hat{b}_i^k - \hat{d}\hat{r}_{z_i^-(k)}|^2_{L^1}.
\]

Then, by Lemma 3.1, for every sufficiently large \( k \), there exists a compact subset \( Z(k) \) of \( \hat{B}_1(w(k)) \) such that 
\[
\text{vol}(\hat{B}_1(w(k)) \setminus Z(k)) / \text{vol} \hat{B}_1(w(k)) \leq \Psi(\epsilon, \delta; n, L)
\]
and
\[
\frac{1}{\text{vol} \hat{B}_s(\alpha)} \int_{\hat{B}_s(\alpha)} \hat{F}_k \, d\text{vol} \leq \Psi(\epsilon, \delta; n, L)
\]
for every \( \alpha \in \hat{Z}(k) \) and every \( 0 < \hat{s} < 10 \). Thus, by an argument similar to the proof of [6, Theorem 3.3], for every \( \alpha \in \hat{Z}(k) \) and every \( 0 < \hat{s} < 1 \), there exist a compact subset \( \hat{P}^\alpha_{\hat{s}} \) of \( \hat{B}_s(\alpha) \), a point \( p^\alpha_{\hat{s}} \in \hat{P}^\alpha_{\hat{s}} \), and a map \( q^\alpha_{\hat{s}} \) from \( (\hat{B}_s(\alpha), \alpha) \) to \( (\hat{B}_s(p^\alpha_{\hat{s}}), p^\alpha_{\hat{s}}) \) such that the map \( \hat{Q}^\alpha_{\hat{s}} = (\hat{b}_1^k, \ldots, \hat{b}_m^k, \hat{q}^\alpha_{\hat{s}}) \) from \( \hat{B}_s(\alpha) \) to \( \hat{B}_{\hat{s} + \Psi\hat{s}}(\hat{b}_1^k, \ldots, \hat{b}_m^k, \hat{q}^\alpha_{\hat{s}}) \) is an \( \Psi\hat{s}\)-Gromov-Hausdorff approximation. By an argument similar to the proof of Claim 3.40, for every \( \alpha \in \hat{Z}(k) \) and every \( 0 < \hat{s} < 1 \), we have that \( \hat{b}_i^k = \hat{f}_i^k + \text{constant} \pm \Psi\hat{s} \) on \( \hat{B}_s(\alpha) \) for every \( 1 \leq i \leq l \), and \( \hat{b}_i^k = \hat{r}_{z_i^-(k)} + \text{constant} \pm \Psi\hat{s} \) on \( \hat{B}_s(\alpha) \) for every \( l + 1 \leq i \leq m \). Therefore, the map \( \hat{Q}_{\hat{s}}^\alpha = (\hat{f}_1^k, \ldots, \hat{f}_l^k, \hat{r}_{z_{i-1}^-(k)}(\alpha), \ldots, \hat{r}_{z_m^-(k)}(\alpha), \hat{p}^\alpha_{\hat{s}}) \) from \( \hat{B}_s(\alpha) \) to \( \hat{B}_{\hat{s} + \Psi\hat{s}}(\hat{f}_1^k, \ldots, \hat{f}_l^k, \hat{r}_{z_{i-1}^-(k)}(\alpha), \ldots, \hat{r}_{z_m^-(k)}(\alpha), \hat{p}^\alpha_{\hat{s}}) \) is an \( \Psi\hat{s}\)-Gromov-Hausdorff approximation. Without loss of generality, we can assume that there exists a compact subset \( \hat{Z}(\infty) \) of \( \hat{B}_1(w) \) such that \( \hat{Z}(k) \to \hat{Z}(\infty) \). Let \( U = \hat{Z}(\infty) \cap \bigcap_{1 \leq i \leq l, \hat{s} \leq 1} (\hat{B}_{\hat{s}}(\alpha) \setminus \{x_j^\alpha\}) \cap (R_m\hat{s})_{\hat{s},r} \). By Proposition 2.5, we have \( \hat{v}(\hat{B}_1(w) \cap U) / \hat{v}(\hat{B}_1(w)) \geq 1 - \Psi \). Since \( \alpha \in (R_m)_{r,\hat{s}} \), we have that the map \( T^\alpha_{\hat{s}} = (\hat{f}_1, \ldots, \hat{f}_l, \hat{r}_{z_{i-1}^-(k)}, \ldots, \hat{r}_{z_m^-(k)}) \) from \( \hat{B}_s(\alpha) \) to \( \hat{B}_s(T^\alpha_{\hat{s}}(\alpha)) \) is an \( \Psi\hat{s}\)-Gromov-Hausdorff approximation for every \( \alpha \in U \) and every \( 0 < \hat{s} < 1 \). Let \( \alpha, \beta \) be points in \( U \) with \( \alpha \neq \beta \). Put \( \hat{s} = \|\alpha, \beta\|_{L^1}^{-1} < 1 \). Then we have
\[
\frac{(\hat{f}_1(\alpha), \ldots, \hat{f}_i(\alpha), \hat{r}_{z_{i-1}^-(\alpha)}, \ldots, \hat{r}_{z_m^-(\alpha)}, (\hat{f}_1(\beta), \ldots, \hat{f}_l(\beta), \hat{r}_{z_{i-1}^-(\beta)}, \ldots, \hat{r}_{z_m^-(\beta)})}{\|\alpha, \beta\|_{L^1}^{-1}} = (1 \pm \Psi \hat{s}) = \frac{(\alpha, \beta)}{\|\alpha, \beta\|_{L^1}^{-1}}.
\]
Therefore we have the assertion.

**Lemma 3.46.** Let \( (Y, y, \nu) \) be a Ricci limit space, \( l, k, m \) positive integers with \( 1 \leq l \leq m \leq n \), \( x \) a point in \( Y \), \( \{h_i\}_{1 \leq i \leq l} \) a collection of Lipschitz functions on \( Y \), \( \{x_i\}_{1 \leq i \leq k} \) of points in \( Y \), and \( \{a_i^l\}_{1 \leq i \leq k, 1 \leq j \leq l} \) of real numbers Let \( f_j = \sum_{i=1}^k a_{i}^j r_{x_i} \). Assume that the following properties hold:

37
1. We have
\[ \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} |df_j - dh_j|dv = 0 \]
for every \( j \).

2. We have
\[ x \in \bigcup_{r > 0} \left( \bigcap_{\delta > 0} \left( \bigcup_{r > 0} \text{Leb} \left( \bigcap_i \left( D_{\delta}^r \setminus \{ x_i \} \right) \right) \right) \right) \).

3. The limit
\[ \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle dh_i, dh_j \rangle dv \in \mathbb{R} \]
exists for every \( i, j \).

4. We have
\[ \det \left( \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle dh_i, dh_j \rangle dv \right)_{i,j} \neq 0. \]

Then, for every \( 0 < \delta < 1 \), there exists \( r_0 > 0 \) such that for every \( 0 < s < r_0 \), there exists compact subset \( K_s \) of \( B_s(x) \) such that the following properties hold:

1. \( v(K_s)/v(B_s(x)) \geq 1 - \delta \).

2. For every \( \alpha \in K_s \) and every sufficiently small \( t > 0 \), there exist a collection \( \{ w_j^i(\alpha) \}_{1 \leq j \leq l} \) of points in \( Y \), and a compact subset \( U_t \) of \( B_t(\alpha) \) such that \( v(U_t)/v(B_t(\alpha)) \geq 1 - \delta \) and that the map \( \Phi_t = ((h_1, \ldots, h_l)A, r_{w_1^1(\alpha)}, \ldots, r_{w_{m-l}^m(\alpha)}) \) from \( U_t \) to \( \mathbb{R}^m \), is an \((1 \pm \delta)\)-bi-Lipschitz to the image, where
\[ A = \sqrt{\left( \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle dh_i, dh_j \rangle dv \right)_{i,j}}^{-1}. \]

PROOF. Define a collection \( \{ g_i \}_{1 \leq i \leq l} \) of Lipschitz functions \( g_i \) on \( Y \) by \( (g_1, \ldots, g_l) = (h_1, \ldots, h_l)A. \) By the definition, we have
\[ \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle g_i, g_j \rangle dv = \delta_{i,j}. \]

By the assumption and Corollary 3.37, we have
\[ \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} |\langle g_i, g_j \rangle - \delta_{i,j}|dv = 0. \]

Put \( (F_1, \ldots, F_l) = \left( \sum_{i=1}^k b_i^1 r_{x_i}, \ldots, \sum_{i=1}^k b_i^l r_{x_i} \right) = \left( \sum_{i=1}^k a_i^1 r_{x_i}, \ldots, \sum_{i=1}^k a_i^l r_{x_i} \right) A. \) Let \( L \geq 1 \) satisfying \( |A| + \sum_{i,j} (b_i^j)^2 \leq L. \) Fix \( 0 < \delta < 1. \) By Lemma 3.41, we have the following claim:
CLAIM 3.47. There exists $r_1 > 0$ such that for every $0 < s \leq r_1$, there exist a compact subset $K_s$ of $B_s(x)$ such that the following properties hold:

1. $\frac{1}{v(B_s(x))} \int_{B_s(x)} |dF_j - dg_j|d\nu \leq \delta$

for every $0 < s < r_0$. Thus, by Lemma 3.1, for every $0 < s < r_0/100$, there exists a compact subset $X_s$ of $B_s(x)$ such that $v(X_s)/v(B_s(x)) \geq 1 - \Psi(\delta; n)$ and

2. $\frac{1}{v(B_{s\delta}(\alpha))} \int_{B_{s\delta}(\alpha)} |dF_j - dg_j|d\nu \leq \Psi(\delta; n)$

for every $\alpha \in X_s$ and every $0 < \delta \leq s$. Put $V_s = K_s \cap X_s$ for every $0 < s < \min\{r_0, r_1\}/1000$. Then we have $v(V_s)/v(B_s(x)) \geq 1 - \Psi(\delta; n)$. Fix $0 < s < \min\{r_0, r_1\}/1000$ and $\alpha \in V_s$. By an argument similar to the proof of Claim 3.40, for every sufficiently small $t > 0$, we have $F_j = f_j + \text{constant} \pm \Psi(\delta; n)t$ on $B_t(\alpha)$. Fix such $t > 0$ and put $U_t = B_{t/2}(\alpha) \cap E_t$. Then we have $v(U_t)/v(B_{t/2}(\alpha)) \geq 1 - \Psi(\delta; n)$. Let $p_1, p_2$ be points in $U_t$ with $p_1 \neq p_2$. Put $\hat{t} = \frac{1}{p_1, p_2} > 0$. Then we have

$$
(f_1(p_1), \ldots, f_i(p_1), r_{w_1}^i(\alpha)p_1), \ldots, (f_i(p_1), \ldots, f_i(p_2), r_{w_{m-i}}^i(\alpha)p_2), \ldots, (f_1(p_2), \ldots, f_i(p_2), r_{w_1}^i(\alpha)p_2), \ldots, (f_i(p_2), \ldots, f_i(p_2), r_{w_{m-i}}^i(\alpha)p_2) + \Psi \hat{t} = (1 + \delta)p_1, p_2 + \Psi \hat{t} = (1 + \Psi)p_1, p_2.
$$

Therefore we have the assertion.

LEMMA 3.48. Let $(Y, y, v)$ be a Ricci limit space, $l$ a positive integer, $\{f_i\}_{1 \leq i \leq l}$ a collection of Lipschitz functions on $Y$, $f$ a Lipschitz function on $Y$, and $A$ a Borel subset of $Y$. Assume that $\text{span}\{d{f_1}(x), \ldots, d{f_l}(x)\} = T_x^*Y$ for $a.e. x \in A$. Then, for $a.e. x \in A$, there exists a collection of real numbers $\{b_i(x)\}_{1 \leq i \leq l}$ such that

$$
\lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \left| df - \sum_{i=1}^l b_i(x)d{f_i} \right|^2 d\nu = 0.
$$

39
PROOF. Without loss of generality, we can assume that \( \{df_i(x)\}_i \) is a basis of \( T_x^*Y \) for every \( x \in A \). Put

\[
(b_1(x), \ldots, b_l(x)) = \left( \langle df, df_1(x) \rangle, \ldots, \langle df, df_l(x) \rangle \right) \sqrt{\langle df, df_j(x) \rangle_i, j}^{-1}
\]

for every \( x \in A \). Then, by Lebesgue’s differentiation theorem, for a.e. \( x \in A \), we have

\[
\lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} |df|^2 dv = |df|^2(x), \quad \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle df, df_i \rangle dv = \langle df, df_i \rangle(x)
\]

and

\[
\lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle df_i, df_j \rangle dv = \langle df_i, df_j \rangle(x)
\]

for every \( i, j \). Then, since it is easy to check that

\[
\lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \left| df - \sum_{i=1}^l b_i(x)df_i \right|^2 dv
\]

\[
= \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \left| \sum_{i=1}^l b_i(x)df_i \right|^2 dv
\]

\[
= \left| \sum_{i=1}^l b_i(x)df_i(x) \right|^2
\]

for a.e. \( x \in A \), we have

\[
\lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \left| df - \sum_{i=1}^l b_i(x)df_i \right|^2 dv
\]

\[
= \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} |df|^2 dv - 2 \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \langle df, \sum_{i=1}^l b_i(x)df_i \rangle dv
\]

\[
+ \lim_{r \to 0} \frac{1}{v(B_r(x))} \int_{B_r(x)} \left| \sum_{i=1}^l b_i(x)df_i \right|^2 dv = 0
\]

for a.e. \( x \in A \).

\[
\square
\]

THEOREM 3.49 (Rectifiability associated with Lipschitz functions). Let \( (Y, y, v) \) be a Ricci limit space, \( l \) a positive integer, \( \{f_i\}_{1 \leq i \leq l} \) a collection of Lipschitz functions on \( Y \), \( A \) a Borel subset of \( Y \). Assume that \( \{df_i(x)\}_{1 \leq i \leq l} \) are linearly independent in \( T_x^*Y \) for a.e. \( x \in A \). Then, there exist \( 0 < \alpha(n) < 1 \), collections of compact subsets \( \{C_{k,i}\}_{1 \leq k \leq n, i \in \mathbb{N}} \) of \( A \), of points \( \{x_{k,i}\}_{k,i} \) in \( A \), and of points \( \{x^*_{k,i}\}_{k,i,1 \leq s \leq k-1} \) in \( Y \) such that the following properties hold:

1. \( C_{k,i} \subset R_{k,\alpha(n)} \cap \bigcap_{j=1}^{k-1} (A \setminus (C_{j,i} \cup \{x^*_{j,i}\})) \) and \( \nu \left( A \setminus \bigcup_{1 \leq k \leq n, i \in \mathbb{N}} C_{k,i} \right) = 0 \) for every \( k \).
2. For every $l \leq k \leq n$, every $x \in \bigcup_{i \in \mathbb{N}} C_{k,i}$ and every $0 < \delta < 1$, there exists $C_{k,i}$ such that $x \in C_{k,i}$ and that the map $\phi_{k,i} = ((f_1, \ldots, f_l) \sqrt{(\langle df_i, df_j \rangle(x_k)))^{-1}, r_{x_{k,i}}^{1}, \ldots, r_{x_{k,i}^{l-1}} \text{ from } C_{k,i}$ to $\mathbb{R}^k$, is $(1 \pm \delta)$-bi-Lipschitz to the image.

3. The limit measure $v$ and the $k$-dimensional Hausdorff measure $H^k$ are mutually absolutely continuous on $C_{k,i}$. Moreover, $v$ is Ahlfors $k$-regular at every $x \in C_{k,i}$.

**PROOF.** Let $\{C^y_{k,i}\}_{k,i}$ be a collection of Borel subset of $Y$, and $\{x^j_{k,i}\}_{k,i}$ of points in $Y$ as in Theorem 3.16, where $x^j_{k,i} = y$. By Lemma 3.13, without loss of generality, we can assume that $C_{k,i}$ is bounded for every $i, k$. By the construction of $T^*Y$, we have span$\{dx^1_{k,i}(x), \ldots, dx^k_{k,i}(x)\} = T^*X$ for a.e. $x \in C^w_{k,i}$. Therefore, we have $v(A \cap C^w_{k,i}) = 0$ for every $k < l$. Since

$$v \left( \mathcal{R}_k \setminus \bigcup_{\tau > 0} \left( \bigcap_{\delta > 0} \left( \bigcup_{i,j} \{D^\tau_{x_i^j} \setminus \{x^j_i\} \cap (\mathcal{R}_k)_{\delta,\tau}\} \right) \right) \right) = 0,$$

the following claim follows from Lemma 3.46 and Lemma 3.48, directly:

**CLAIM 3.50.** For every $k \geq l$ and every $i \in \mathbb{N}$, there exists a Borel subset $A_{k,i}$ of $A \cap C_{k,i}$ such that the following properties hold:

1. $v(A \cap C_{k,i} \setminus A_{k,i}) = 0$.

2. For every $x \in A_{k,i}$ and every $0 < \delta < 1$, there exists $r^\delta_x > 0$ such that for every $0 < s < r^\delta_x$, there exists a compact subset $K(x, \delta, s)$ of $\overline{B}_s(x)$ such that the following properties hold:

(a) $v(K(x, \delta, s))/v(B_s(x)) \geq 1 - \delta$.

(b) For every $\alpha \in K(x, \delta, s)$ and every sufficiently small $t > 0$, there exist a collection of points $\{w(i, x, \delta, s, \alpha, t)\}_{i \leq l - k}$ in $Y$, and a compact subset $U(x, \delta, s, \alpha, t)$ of $\overline{B}_t(x)$ such that the map $\Phi^\alpha_{\delta,\tau,\alpha,t}(x) = ((f_1, \ldots, f_l)A(x), w(1,x,\delta,s,\alpha,t), \ldots, w(k-l,x,\delta,s,\alpha,t))$ from $U(x, \delta, s, \alpha, t)$ to $\mathbb{R}^k$, is $(1 \pm \delta)$-bi-Lipschitz to the image, where

$$A(x) = \sqrt{\lim_{t \to 0} \frac{1}{v(B_t(x))} \int_{B_t(x)} \langle df_i, df_j \rangle dv}_{s,t} = \sqrt{\langle df_s, df_t \rangle(x)}_{s,t}.$$
$A_{k,i}/v(B_i(\alpha)) \geq 1 - N^{-1}$ for every $0 < \tilde{t} < t$. Take $w(i, x, N^{-1}, s_j^N, \alpha, \tilde{t})$ and $U(x, N^{-1}, s_j^N, \alpha, \tilde{t})$ as in Claim 3.50. Put $\hat{U} = U(x, N^{-1}, s_j^N, \alpha, \tilde{t}) \cap \hat{A}_{k,i}$. Then we have
\[
v(\hat{U} \cap \hat{A}_{k,i} \setminus \bigcup_{j \in N} \hat{U}(x_j^N, N^{-1}, s_j^N, \alpha_j^N, t_j^N)) = \Psi(N^{-1}; n)v(B_{10}(A_{k,i})).
\]

Put $\hat{U}(j, N) = \hat{U}(x_j^N, N^{-1}, s_j^N, \alpha_j^N, t(j^N))$, $w(i, j, N) = w(i, x_j^N, N^{-1}, s_j^N, \alpha_j^N, t(j^N))$, and put $\hat{U}(j, N) = \bigcap_{N_0 \in N} \left( \bigcup_{N_1 \geq N_0} \hat{U}(j, N_1) \right)$ and $U(j, N) = \hat{U}(j, N) \cap U(j)$. Then we have
\[
v(\hat{A}_{k,i} \setminus \bigcup_{j \in N} U(j)) = 0 \quad \text{and} \quad \bigcup_{N \in \mathbb{N}} U(j, N) = U(j).
\]
Fix $j$, $w \in \bigcup_{N \in \mathbb{N}} U(j, N)$ and $0 < \delta < 1$. There exists $N_0$ such that $w \in U(j, N_0)$. Let $N_1 \in \mathbb{N}$ with $N^{-1} \ll \delta$. Since $w \in \bigcup_{N_0 \geq N_1} \hat{U}(j, N_2)$, there exists $N_2 \geq N_1$ such that $w \in \hat{U}(j, N_2)$. Especially we have $w \in U(j, N_2)$. Thus the map $G_{j,N_2} = ((f_1, \ldots, f_l)A(x_j^N_2), t(x_j^N_2))$ from $U(j, N_2)$ to $\mathbb{R}^k$, is $(1 + N_2^{-1})$-bi-Lipschitz to the image. Especially, $G_j,N_2$ is $(1 + \delta)$-bi-Lipschitz to the image. Therefore, we have the assertion.

**Remark 3.52.** The radial rectifiability theorem, Theorem 3.16, corresponds to Theorem 3.49 for the case: $l = 1, f_1 = r_x, A = Y$.

We will end this subsection by giving two corollaries of Theorem 3.49. For a metric space $X$, define a distance on $\mathbb{R}_{\geq 0} \times X/(\{0\} \times X)$ by $(t_1, x_1), (t_2, x_2) = \sqrt{t_1^2 + t_2^2 - 2t_1t_2 \cos \min\{\frac{x_1}{t_2}, \frac{x_2}{t_2}, \pi\}}$. Denote this metric space by $C(X)$, and put $p = [(0, x)] \in C(X)$. The next corollary is used in [24], essentially.

**Corollary 3.53.** Let $X$ be a compact geodesic space and $l$ a nonnegative integer. Assume that $l \leq n$, $\dim_q X = n - l - 1$ and that $(\mathbb{R}^l \times C(X), (0, p))$ is a Ricci limit space. Then, $X$ is $H^{n-l-1}$-rectifiable.

**Proof.** Define a collection of 1-Lipschitz functions $\{g\} \cup \{\pi_j\}_{1 \leq j \leq l}$ on $\mathbb{R}^k \times C(X)$ by $\pi_j(t_1, \ldots, t_l, w) = t_j$ and $g(t_1, \ldots, t_l, w) = \overline{p,w}$. By Theorem 3.30 and [4, Theorem 5.9], we have $d(\pi_j, \pi_j)(\alpha) = \delta_{i,j}, d(\pi_i, g)(\alpha) = 0, |dg| (\alpha) = 1$ for a.e. $\alpha \in \mathbb{R}^l \times C(X)$ with respect to the n-dimensional Hausdorff measure $H^n$. Therefore, by applying Theorem 3.49 for a collection of Lipschitz functions $\{\pi_j\}_{1 \leq j \leq l} \cup \{g\}$ and $A = \mathbb{R}^l \times C(X)$, there exists a collection of Borel subsets $\{C_{k,i}\}_{1 \leq k \leq n}$ as in Theorem 3.49. Since the product measure $H^l \times H^{n-l}$ on $\mathbb{R}^l \times C(X)$ is equal to $H^n$ (see appendix in [24]), by Fubini’s theorem, we have
\[
0 = H^n \left( (\mathbb{R}^l \times C(X)) \setminus \bigcup_{k,i} C_{k,i} \right) = \int_{\mathbb{R}^l} H^{n-l} \left( (\{t_1, \ldots, t_l\} \times C(X)) \setminus \bigcup_{k,i} C_{k,i} \right) dH^l.
\]
Especially, there exists \((t_1, \ldots, t_l) \in \mathbb{R}^l\) such that \(H^{n-l} \left( \left\{ t_1, \ldots, t_l \right\} \times C(X) \right) \cap C_{k,i} = 0\). Put \(\tilde{C}_{k,i} = \left( \left\{ t_1, \ldots, t_l \right\} \times C(X) \right) \cap C_{k,i}\) and regard it as a subset of \(C(X)\), canonically.

Now, we remark that
\[
\int_{C(X)} f dH^{n-l} = \int_0^\infty \int_{\partial B(p)} f dH^{n-l-1} dt
\]
holds for every \(f \in L^1(C(X))\) (this is the co-area formula for the distance function from the pole in \(C(X)\)). See for instance appendix in [24]). Thus, especially, we have \(H^{n-l-1} \left( \partial B(p) \cap C(X) \cap \tilde{C}_{k,i} \right) = 0\) for a.e. \(t > 0\). Then it is not difficult to check the assertion.

Remark 3.54. With the same notation as in Corollary 3.53, we have \(0 < H^{n-l-1}(B_r(x)) < \infty\) for every \(x \in X\) and every \(r > 0\). It follows from [4, Theorem 5.9], [6, Theorem 4.6] and the above co-area formula for the distance function from the pole on \(C(X)\). We skipped the proof because it is not difficult to check it.

Similarly, we have the following:

Corollary 3.55. Let \((X, x)\) be a pointed proper geodesic space, \(l\) a nonnegative integer. Assume that \(l \leq n\), \(\dim_H X = n - l\) and that \((\mathbb{R}^l \times X, (0_l, x))\) is a Ricci limit space. Then, \(X\) is \(H^{n-l}\)-rectifiable.

4 Convergence of \(L^\infty\)-functions and of Lipschitz functions

In this section, we will give two-notions of convergence of a sequence of \(L^\infty\)-functions with respect to the measured Gromov-Hausdorff topology. By using these notions, we will give the definition of a convergence of the differentials of Lipschitz functions (see Definition 4.15). Moreover, by combining with several results given in section 3, we will discuss convergence of harmonic functions. In [27], we can also find related important, interesting results to this section. Throughout the following subsections 4.1 and 4.2, we shall fix the following:

1. Let \(\{(Z_i, z_i)\}_{1 \leq i \leq \infty}\) be a sequence of pointed proper geodesic spaces, \(x_i \in Z_i\).
2. Let \(\nu_i\) be a Radon measure on \(Z_i\) for every \(1 \leq i \leq \infty\).
3. \(\nu_i(B_1(z_i)) = 1\) holds for every \(i\).
4. For every \(R \geq 1\), there exists \(\kappa = \kappa(R) \geq 1\) such that \(\nu_i(B_{2s}(z)) \leq 2^s \nu_i(B_s(z))\) for every \(1 \leq i \leq \infty\), every \(z \in Z_i\) and every \(0 < s \leq R\).
5. \((Z_i, x_i, z_i, v_i) \to (Z_\infty, x_\infty, z_\infty, v_\infty)\).

### 4.1 Pointwise strong convergence of \(L^\infty\)-functions

Our aims in this subsection are to give the following notion and several fundamental properties of it:

**Definition 4.1** (Pointwise strong convergence of \(L^\infty\)-functions). Let \(R\) be a positive number, \(w_\infty\) a point in \(B_R(x_\infty)\), and \(\{f_i\}_{1 \leq i \leq k}\) a sequence of \(L^\infty\)-functions \(f_i\) on \(B_R(x_i)\) with \(\sup_i |f_i|_{L^\infty(B_R(x_i))} < \infty\). We say that \(f_i\) converges strongly to \(f_\infty\) at \(w_\infty\) if for every \(\epsilon > 0\), there exists \(r > 0\) such that

\[
\limsup_{i \to \infty} \frac{1}{v_i(B_r(w_i))} \int_{B_r(w_i)} \left| f_i - \frac{1}{v_\infty(B_r(w_\infty))} \int_{B_r(w_\infty)} f_\infty dv_\infty \right| dv_i \leq \epsilon
\]

and

\[
\limsup_{i \to \infty} \frac{1}{v_\infty(B_r(w_\infty))} \int_{B_r(w_\infty)} \left| f_\infty - \frac{1}{v_i(B_r(w_i))} \int_{B_r(w_i)} f_idv_i \right| dv_\infty \leq \epsilon
\]

for every \(0 < t < r\) and every \(w_i \to w_\infty\).

**Example 4.2.** Fix \(f \in C^0(B_R(x_\infty))\) and put \(f_i = f \circ \phi_i\). Then, it is easy to check that \(f_i\) converges strongly to \(f_\infty\) at every \(w \in B_R(x_\infty)\).

We shall give a fundamental result about this convergence without the proof because it is not difficult to check it:

**Proposition 4.3.** Let \(k\) be a positive integer, \(R\) a positive number, \(\{f_i^l\}_{1 \leq i \leq k}\) a collection of \(L^\infty\)-functions on \(B_R(x_i)\) for every \(1 \leq i \leq k\) with \(\sup_{i,l} |f_i^l|_{L^\infty(B_R(x_i))} < \infty\), \(w_\infty\) a point in \(B_R(x_\infty)\) and \(\{F_i\}_{1 \leq i \leq k}\) a sequence of continuous functions on \(\mathbb{R}^k\). Assume that \(f_i^l\) converges strongly to \(f_\infty^l\) at \(w_\infty\) for every \(l\), and that \(F_i\) converges to \(F_\infty\) with respect to the compact uniformly topology. Then, \(F_i(f_i^1, \ldots, f_i^k)\) converges strongly to \(F_\infty(f_\infty^1, \ldots, f_\infty^k)\) at \(w_\infty\).

**Remark 4.4.** Let \(k\) be a positive integer, \(\{f_i^l\}_{1 \leq i \leq k}\) a collection of \(L^\infty\)-functions \(f_i^l\) on \(B_R(x_i)\) for every \(1 \leq i \leq \infty\), \(w_\infty\) a point in \(B_R(x_\infty)\), and \(\{F_i\}_{1 \leq i \leq \infty}\) a sequence of locally \(L^\infty\)-functions on \(\mathbb{R}^k\). Assume that the following properties hold:

1. \(\sup_{i,l} |f_i^l|_{L^\infty(B_R(x_i))} < \infty\).

2. \(f_i^l\) converges strongly to \(f_\infty^l\) at \(w_\infty\) for every \(l\).

3. The limits

\[
d' = \lim_{r \to 0} \frac{1}{v_\infty(B_r(w_\infty))} \int_{B_r(w_\infty)} f_\infty dv_\infty \in \mathbb{R}
\]

exist for every \(l\).
4. There exists an open neighborhood $U$ at $(a^1, \ldots, a^k) \in \mathbb{R}^k$ such that $F_i$ is continuous on $U$ for every $1 \leq i \leq \infty$, and that $F_i$ converges to $F_\infty$ on $U$ uniformly.

Then, we also have that $F_i(f_i^1, \ldots, f_i^k)$ converges strongly to $F_\infty(f_\infty^1, \ldots, f_\infty^k)$ at $w_\infty$.

The following proposition is the main result in this subsection:

**Proposition 4.5.** Let $\{(M_i, m_i)\}_i$ be a sequence of pointed $n$-dimensional complete Riemannian manifolds with $\text{Ric}_{M_i} \geq -(n-1)$, $(Y, y, v)$ a Ricci limit space of $\{(M_i, m_i, \text{vol})\}_i$, $R$ a positive number, $x_\infty, z_\infty$ points in $Y$, $x_i, z_i$ points in $M_i$ for every $1 \leq i < \infty$, $f_i$ a $C^2$-function on $B_R(x_i)$ for every $i \leq \infty$, and $f_\infty$ a Lipschitz function on $B_R(x_\infty)$. Assume that $\sup_i \text{Lip} f_i < \infty$, $(M_i, m_i, x_i, z_i, f_i, \text{vol})^{(\phi_i, R_i, \epsilon_i)} \to (Y, y, x_\infty, z_\infty, f_\infty, v)$ and

$$\sup_i \int_{B_R(x_i)} |\text{Hess}_{f_i}|d\text{vol} < \infty.$$ 

Then, $(dr_{z_i}, df_i)$ converges strongly to $(dr_{z_\infty}, df_\infty)$ at a.e. $w_\infty \in B_R(x_\infty)$.

**Proof.** Fix $\epsilon > 0$ and let $L \geq 1$ with

$$\sup_i \left( \frac{1}{\text{vol} B_R(x_i)} \int_{B_R(x_i)} |\text{Hess}_{f_i}|d\text{vol} + \text{Lip} f_i \right) \leq L.$$ 

By Theorem 3.30, there exist $0 < \eta << \epsilon$ and a Borel subset $X(\epsilon)$ of $B_R(x_\infty) \cap D_{\epsilon} \setminus B_\eta(z_\infty)$ such that $\nu(B_R(x_\infty) \setminus X(\epsilon))/\nu(B_R(x_\infty)) \leq \epsilon$ and

$$\left| \frac{f_\infty \circ \gamma(z_\infty, \alpha + h) - f_\infty(\alpha)}{h} - \langle dr_{z_\infty}, df_\infty \rangle(\alpha) \right| \leq \epsilon$$

for every $\alpha \in X(\epsilon)$, every real number $h$ with $0 < |h| < \eta$, and every isometric embedding $\gamma$ from $[0, z_\infty, \alpha + \eta]$ to $Y$ with $\gamma(0) = z_\infty$, $\gamma(z_\infty, \alpha) = \alpha$. On the other hand, by Lebesgue’s differentiation theorem, there exists a Borel subset $\hat{X}(\epsilon)$ of $X(\epsilon)$ such that $\nu(X(\epsilon) \setminus \hat{X}(\epsilon)) = 0$ and that for every $\alpha \in \hat{X}(\epsilon)$, there exists $r(\alpha) > 0$ such that

$$\frac{1}{\nu(B_t(\alpha))} \int_{B_t(\alpha)} |\langle dr_{z_\infty}, df_\infty \rangle - \langle dr_{z_\infty}, df_\infty \rangle(\alpha)|d\nu < \epsilon$$

for every $0 < t < r(\alpha)$. Put $l = \eta^{1/4}$. By an argument similar to the proof of Proposition 3.1, for every $1 \leq i < \infty$, there exists a compact subset $K_i$ of $B_{R-\epsilon}(x_i)$ such that

$$\frac{\text{vol}(B_{R-\epsilon}(x_i) \setminus K_i)}{\text{vol} B_{R-\epsilon}(x_i)} \leq \Psi(l^{-1}; n, R, L) \quad \text{and} \quad \frac{1}{\text{vol} B_t(w)} \int_{B_t(w)} |\text{Hess}_{f_i}|d\text{vol} \leq l$$

for every $w \in K_i$ and every $0 < t < \epsilon/100$. Without loss of generality, we can assume that there exists a compact subset $K_\infty$ of $\overline{B_R(x_\infty)}$ such that $K_i \to K_\infty$. Put $W(\epsilon) = K_\infty \cap X(\epsilon)$. By Proposition 2.5, we have $\nu(W(\epsilon))/\nu(B_R(x_\infty)) \geq 1 - \Psi(\epsilon; n, R, L)$. Fix $\alpha \in W(\epsilon)$,
$0 < t << \min\{\eta, r(\alpha)\}$ and an isometric embedding $\gamma$ from $[0, \infty, \alpha + \eta]$ to $Y$ with $\gamma(0) = z_\infty, \gamma(\infty, \alpha) = \alpha$. Let $\{\alpha_i\}$ be a sequence of points $\alpha_i$ in $K_i$ with $\alpha_i \to \alpha$. Define a Borel function $F_i$ on $B_i(\alpha_i) \setminus (C_{z_i} \cup \{\eta\})$ by $F_i(\beta) = (f_i \circ \gamma_\beta(z_i, \beta - \eta^2) - f_i(\beta))/(\eta^2)$, where $\gamma_\beta$ is the minimal geodesic from $z_i$ to $\beta$. By an argument similar to the proof of Claim 3.34, we have

$$\frac{1}{\text{vol} B_i(\alpha_i)} \int_{B_i(\alpha_i)} |\langle df_i, dr_{z_i} \rangle - F_i|d\text{vol} \leq \eta^2 \frac{C(n)}{\text{vol} B_i(\alpha_i)} \int_{B_i(\alpha_i)} |\text{Hess}_{f_i} |d\text{vol}| \leq \eta^2 C(n)l \leq \Psi(\epsilon; n)$$

for every $i$. Fix $i_0$ with $\epsilon_i << t$ for every $i \geq i_0$. We remark that $\phi_i(\beta_i), \alpha \leq t + \epsilon_i \leq \eta^3$ for every $i \geq i_0$ and every $\beta_i \in B_i(\alpha_i)$. Then, since

$$z, \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)) \eta^{-2}d\gamma + \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), \phi_i(\beta_i), \eta^{-2}d\gamma - z, \phi_i(\beta_i) \eta^{-2}d\gamma < 3\epsilon_i,$$

we have

$$z, \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)) \eta^{-2}d\gamma + \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), \phi_i(\beta_i) \eta^{-2}d\gamma - z, \alpha \eta^{-2}d\gamma < 5\eta.$$

Similarly, we have

$$z, \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)) \eta^{-2}d\gamma + \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), \gamma(z, \alpha + \eta) \eta^{-2}d\gamma - z, \gamma(z, \alpha + \eta) \eta^{-2}d\gamma < 5\eta,$$

$$\phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), \gamma(z, \alpha + \eta) \eta^{-2}d\gamma \geq \eta^{-1} - \eta, \phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), z \eta^{-2}d\gamma \geq \eta^{-1} - \eta$$

and

$$\phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), \alpha \eta^{-2}d\gamma = 1 \pm 5\eta.$$

Therefore, by the splitting theorem on limit spaces, we have

$$\phi_i(\gamma_\beta(z_i, \beta_i - \eta^2)), \gamma(z, \alpha - \eta^2) \eta^{-2}d\gamma \leq \Psi(\eta; n).$$

Thus we have

$$f_i(\gamma_\beta(z_i, \beta_i - \eta^2)) - f_i(\beta_i) = f_\infty(\phi_i(\gamma_\beta(z_i, \beta_i - \eta^2))) - f_\infty(\phi_i(\beta_i)) \pm \frac{\epsilon_i}{\eta^2}$$

$$= f_\infty(\gamma(z, \alpha - \eta^2)) - f_\infty(\alpha) \pm \Psi(\eta; n, L)$$

$$= \langle dr_z, df_\infty \rangle(\alpha) \pm \Psi(\eta; n, L).$$

Especially, we have

$$\frac{1}{\text{vol} B_i(\alpha_i)} \int_{B_i(\alpha_i)} |F_i - \langle dr_z, df_\infty \rangle(\alpha)|d\text{vol} \leq \Psi(\eta; n, L)$$

for every $i \geq i_0$. Put $W = \cap_{N_1 \in \mathbb{N}} (\cup_{N_2 \geq N_1} W(N_2^{-1}))$. Then we have $v(B_R(x_\infty) \setminus W) = 0$. Moreover, by the argument above, $\langle dr_z, df_i \rangle$ converges strongly to $\langle dr_z, df_\infty \rangle$ at every $w_\infty \in W$. □
Remark 4.6. We shall introduce the following important method to get a uniformly $L^2$-Hessian estimates by using cut-off functions with good properties constructed by Cheeger-Colding: Let $(M, m)$ be a pointed $n$-dimensional complete Riemannian manifold with $\text{Ric}_M \geq -(n-1)$, $R$ a positive number and $f$ a $C^2$-function on $B_R(m)$. Assume that there exists $L \geq 1$ such that

$$|\nabla f|_{L^\infty(B_R(m))} + \int_{B_R(m)} |\Delta f|^2 d\text{vol} \leq L.$$  

Then, we have

$$\int_{B_r(m)} |\text{Hess} f|^2 d\text{vol} < C(n, r, R, L)$$  

for every $0 < r < R$. The proof is as follows. By the standard smoothing argument, without loss of generality, we can assume that $f$ is a smooth function. By [2, Theorem 8.16], there exists a smooth function $\phi$ on $M$ such that $0 \leq \phi \leq 1$, $\phi|_{B_r(m)} = 1$, $\text{supp} \phi \subset B_R(m)$, $|\nabla \phi| \leq C(n, r, R)$ and $|\Delta \phi| \leq C(n, r, R)$. By Bochner’s formula, we have

$$-\frac{1}{2} \Delta |\nabla (\phi f)|^2 \geq |\text{Hess} \phi f|^2 - \langle \nabla \Delta (\phi f), \nabla (\phi f) \rangle - (n-1)|\nabla (\phi f)|^2.$$  

Thus, we have

$$\int_{B_r(m)} |\text{Hess} f|^2 d\text{vol} \leq \int_{B_r(m)} |\text{Hess} \phi f|^2 d\text{vol} \leq \int_{B_r(m)} (\Delta (\phi f))^2 d\text{vol} + C(n, R, L) \leq \int_{B_r(m)} ((f \Delta \phi)^2 + (\phi \Delta f)^2 + |\langle \nabla f, \nabla \phi \rangle|^2) d\text{vol} + C(n, R, L) \leq C(n, r, R, L).$$  

This observation performs a crucial role to study limit functions of harmonic functions in subsection 4.4.

The following proposition follows from Corollary 3.37 directly.

Proposition 4.7. Let $\{(M_i, m_i)\}_i$ be a sequence of pointed $n$-dimensional complete Riemannian manifolds with $\text{Ric}_{M_i} \geq -(n-1)$, $(Y, y, v)$ a Ricci limit space of $\{(M_i, m_i, \text{vol})\}_i$, $w^1, w^2$ points in $Y$, and $w^1_i, w^2_i$ points in $M_i$ for every $i$, satisfying that $w^1_i \to w^1_\infty$ for every $j$. Then $\langle dr_{w^1_i}, dr_{w^2_j} \rangle$ converges strongly to $\langle dr_{w^1_\infty}, dr_{w^2_\infty} \rangle$ at every $z \in Y \setminus (C_{w^1_\infty} \cup C_{w^2_\infty} \cup \{w^1_\infty, w^2_\infty\})$.  

47
4.2 Pointwise weak convergence of $L^\infty$-functions

Our aims in this subsection are to give the following notion and its fundamental properties.

**Definition 4.8** (Pointwise weak convergence of $L^\infty$-functions). Let $R$ be a positive number, $w_\infty$ a point in $B_R(x_\infty)$ and $\{f_i\}_{1 \leq i \leq \infty}$ a sequence of $L^\infty$-functions on $B_R(x_i)$ for every $1 \leq i \leq \infty$ with $\sup_i |f_i|_{L^\infty(B_R(x_i))} < \infty$. We say that $f_i$ converges weakly to $f_\infty$ at $w_\infty$ if for every $\epsilon > 0$, there exists $r > 0$ such that

$$\limsup_{i \to \infty} \left| \frac{1}{v_i(B_i(w_i))} \int_{B_i(w_i)} f_i dv_i - \frac{1}{v_\infty(B_i(w_\infty))} \int_{B_i(w_\infty)} f_\infty dv_\infty \right| \leq \epsilon$$

for every $0 < t < r$ and every $w_i \to w_\infty$.

It is clear that if $f_i$ converges strongly to $f_\infty$ at $w_\infty$, then $f_i$ converges weakly to $f_\infty$ at $w_\infty$. We skip the proof of the next proposition because it is not difficult to check it.

**Proposition 4.9** (Linearity of weak convergence). Let $R$ be a positive number, $w_\infty$ a point in $B_R(x_\infty)$ and $a_i, b_i, c_i, d_i$ $L^\infty$-functions on $B_R(x_i)$ for every $1 \leq i \leq \infty$ with $\sup_i (|a_i| + |b_i| + |c_i| + |d_i|)_{L^\infty(B_R(x_i))} < \infty$. Assume that $a_i, b_i$ converge strongly to $a_\infty, b_\infty$ at $w_\infty$, respectively, and that $c_i, d_i$ converge weakly to $c_\infty, d_\infty$ at $w_\infty$, respectively. Then $a_i c_i + b_i d_i$ converges weakly to $a_\infty c_\infty + b_\infty d_\infty$ at $w_\infty$.

**Proposition 4.10.** Let $\{A_i\}_{1 \leq i \leq \infty}$ be a sequence of Borel subsets $A_i$ of $B_R(x_i)$ and $w_\infty$ a point in $\text{Leb}A_\infty$. Assume that $1_{A_i}$ converges weakly to $1_{A_\infty}$ at $w_\infty$. Then $1_{A_i}$ converges strongly to $1_{A_\infty}$ at $w_\infty$.

**Proof.** Fix $\epsilon > 0$. Let $\{w_i\}_i$ be a sequence of points $w_i$ in $Z_i$ satisfying $w_i \to w_\infty$. There exists $r > 0$ such that $v_\infty(B_i(w_\infty) \cap A_\infty)/v_\infty(B_i(w_\infty)) \geq 1 - \epsilon$ and

$$\limsup_{i \to \infty} \left| \frac{1}{v_i(B_i(w_i))} \int_{B_i(w_i)} 1_{A_i} dv_i - \frac{1}{v_\infty(B_i(w_\infty))} \int_{B_i(w_\infty)} 1_{A_\infty} dv_\infty \right| < \epsilon$$

for every $0 < t < r$. Fix $0 < t < r$. Then we have

$$\frac{1}{v_i(B_i(w_i))} \int_{B_i(w_i)} \left| 1_{A_i} - \frac{1}{v_\infty(B_i(w_\infty))} \int_{B_i(w_\infty)} 1_{A_\infty} dv_\infty \right| dv_i$$

$$\leq \frac{1}{v_i(B_i(w_i))} \int_{B_i(w_i)} \left| 1_{A_i} - v_i(B_i(w_i)) \int_{B_i(w_i)} 1_{A_i} dv_i \right| dv_i + \epsilon$$

$$= \frac{1}{v_i(B_i(w_i))} \int_{A_i} \frac{v_i(B_i(w_i))}{v_i(B_i(w_i))} dv_i + \frac{1}{v_i(B_i(w_i))} \int_{B_i(w_i) \setminus A_i} \frac{v_i(A_i)}{v_i(B_i(w_i))} dv_i + \epsilon$$

$$\leq 2 \frac{v_i(B_i(w_i) \setminus A_i)}{v_i(B_i(w_i))} + \epsilon < 2 \frac{v_\infty(B_i(w_\infty) \setminus A_\infty)}{v_\infty(B_i(w_\infty))} + 2\epsilon < 5\epsilon.$$
for every sufficiently large \( i \). Similarly, we have
\[
\frac{1}{v_\infty(B_t(w_\infty))} \int_{B_t(w_\infty)} \left| 1_{A_\infty} - \frac{1}{v_1(B_t(w_1))} \int_{B_t(w_1)} 1_{A_i} \, dv_1 \right| dv_\infty < 5\epsilon
\]
for every sufficiently large \( i \). Thus, we have the assertion. \( \square \)

The next proposition follows from an argument similar to the proof of Proposition 2.5:

**Proposition 4.11.** Let \( R \) be a positive number, \( \{K_i\}_{1 \leq i \leq \infty} \) a sequence of Borel subsets \( K_i \) of \( \overline{B}_R(x_i) \), and \( \{f_i\}_{1 \leq i \leq \infty} \) of nonnegative valued \( L^\infty \)-functions \( f_i \) on \( \overline{B}_R(x_i) \) with \( \sup_i |f_i|_{L^\infty(B_R(x_i))} < \infty \). Assume that \( K_\infty \) is compact, \( \limsup_{i \to \infty} K_i \subset K_\infty \) and that \( f_i \) converges weakly to \( f_\infty \) at a.e. \( w \in K_\infty \). Then we have
\[
\limsup_{i \to \infty} \int_{K_i} f_i \, dv_1 \leq \int_{K_\infty} f_\infty \, dv_\infty.
\]

We shall give a fundamental result about this weak convergence:

**Proposition 4.12.** Let \( R \) be a positive number, \( \{A_i\}_{1 \leq i \leq \infty} \) a sequence of Borel subsets \( A_i \) of \( \overline{B}_R(x_i) \), and \( \{f_i\}_{1 \leq i \leq \infty} \) of \( L^\infty \)-functions \( f_i \) on \( \overline{B}_R(x_i) \) with \( \sup_i |f_i|_{L^\infty(B_R(x_i))} < \infty \). Assume that \( 1_{A_i} \) converges weakly to \( 1_{A_\infty} \) at a.e. \( w \in B_R(x_\infty) \) and that \( f_i \) converges weakly to \( f_\infty \) at a.e. \( w \in A_\infty \). Then, we have
\[
\lim_{i \to \infty} \int_{A_i} f_i \, dv_1 = \int_{A_\infty} f_\infty \, dv_\infty.
\]

**Proof.** It follows from (the proof of ) Proposition 4.9 and 4.10 that \( f_i 1_{A_i} \) converges weakly to \( f_\infty 1_{A_\infty} \) at a.e. \( w_\infty \in B_R(x_\infty) \). Thus, without loss of generality, we can assume that \( A_i = B_R(x_i) \) for every \( 1 \leq i \leq \infty \). Fix \( \epsilon > 0 \). Let \( L \geq 1 \) with \( \sup_i |f_i|_{L^\infty(B_R(x_i))} + v_\infty(B_R(x_\infty)) < L \). There exists a Borel subset \( \tilde{K}_\infty \) of \( B_R(x_\infty) \) such that \( v(B_R(x_\infty) \setminus \tilde{K}_\infty) = 0 \) and that for every \( w_\infty \in \tilde{K}_\infty \), there exists \( t_{w_\infty} > 0 \) such that \( \overline{B}_{10t_{w_\infty}}(w_\infty) \subset B_R(x) \) and
\[
\limsup_{i \to \infty} \left| \frac{1}{v_1(B_t(w_1))} \int_{B_t(w_1)} f_i \, dv_1 - \frac{1}{v_\infty(B_t(w_\infty))} \int_{B_t(w_\infty)} f_\infty \, dv_\infty \right| < \epsilon
\]
for every \( 0 < s < t_{w_\infty} \) and every \( w_1 \to w_\infty \). By Lemma 2.4, there exists a pairwise disjoint collection \( \{\overline{B}_{r_i}(x_i)\}_i \) such that \( x_i \in \tilde{K}_\infty, r_i << t_{x_i} \), and \( \tilde{K}_\infty \setminus \bigcup_{i=1}^N \overline{B}_{r_i}(x_i) \subset \bigcup_{i=N+1}^\infty \overline{B}_{5r_i}(x_i) \) for every \( N \). Fix \( N \) satisfying \( \sum_{i=N+1}^\infty v_\infty(B_{5r_i}(x_i)) < \epsilon \). Then, we have
\[
\sum_{i=N+1}^\infty v_\infty(B_{5r_i}(x_i)) < 2^{\omega(1)} \epsilon.
\]
For every \( i, j \), let \( x_i(j) \) be a point in \( Z_j \) satisfying \( x_i(j) \to
Then we have
\[
\int_{B_R(x_\infty)} f_\infty dv_\infty = \sum_{i=1}^N \int_{B_r_i(x_i)} f_\infty dv_\infty \pm \Psi(\epsilon; \kappa(1), L)
\]
\[
= \sum_{i=1}^N \int_{B_r_i(x_i)} f_j dv_j \pm \Psi(\epsilon; \kappa(1), L)
\]
\[
= \int_{B_R(x_j)} f_j dv_j \pm \left( \int_{B_R(x_j) \setminus \bigcup_{i=1}^N B_r_i(x_i)} |f_j| dv_j + \Psi(\epsilon; \kappa(1), L) \right).
\]
for every sufficiently large \(j\). On the other hand, by Proposition 2.3 and Proposition 2.5, we have
\[
\limsup_{j \to \infty} \int_{B_R(x_j) \setminus \bigcup_{i=1}^N B_r_i(x_i)} |f_j| dv_j \leq L \limsup_{j \to \infty} v_j \left( B_R(x_j) \setminus \bigcup_{i=1}^N B_r_i(x_i(j)) \right)
\]
\[
\leq L v_\infty \left( \hat{K}_\infty \bigcup_{i=1}^N B_r_i(x_i) \right)
\]
\[
\leq \Psi(\epsilon; \kappa(1), L).
\]
Therefore, we have the assertion.

Next corollary follows from Proposition 4.12 directly.

**Corollary 4.13.** Let \(R\) be a positive number, \(N\) a positive integer, \(\{r_j\}_{1 \leq j \leq N}\) a collection of positive numbers, \(\{z_j\}_{1 \leq j \leq N}\) of points in \(Y\), and \(\{f_i\}_{1 \leq i \leq \infty}\) a sequence of \(L^\infty\)-functions \(f_i\) on \(B_R(x_i)\) with \(\sup_i |f_i|_{L^\infty(B_R(x_i))} < \infty\). Assume that \(f_i\) converges weakly to \(f_\infty\) at a.e. \(w \in B_R(x_\infty) \setminus \bigcup_{i=1}^N B_r_i(z_i)\). Then, we have
\[
\lim_{j \to \infty} \int_{B_R(x_j) \setminus \bigcup_{i=1}^N B_r_i(z_i)} f_j dv_j = \int_{B_R(x_\infty) \setminus \bigcup_{i=1}^N B_r_i(z_i)} f_\infty dv_\infty
\]
for every \(z_i(j) \to z_i\).

### 4.3 Convergence of the differentials of Lipschitz functions

A purpose of this subsection is to give the definition of a convergence: \(df_i \to df_\infty\). See Definition 1.1 or Definition 4.15. Throughout this subsection, we fix the following situation:

1. Let \(\{(M_i, m_i)\}_{1 \leq i < \infty}\) be a sequence of pointed \(n\)-dimensional complete Riemannian manifolds with \(\text{Ric}_{M_i} \geq -(n - 1)\).

2. Let \((Y, y, \nu)\) be a Ricci limit space of \(\{(M_i, m_i, \nu)\}_i\).
3. Let $R$ be a positive number, $\{x_i\}_{1 \leq i < \infty}$ a sequence of points $x_i$ in $M_i$, and $x_{\infty}$ a point in $Y$ satisfying $x_i \to x_{\infty}$.

4. Let $\{f_i\}_{1 \leq i \leq \infty}$ be a sequence of Lipschitz functions $f_i$ on $B_R(x_i)$ with $\sup_i (\text{Lip} f_i + |f_i|_{L^\infty(B_R(x_i))}) < \infty$.

In this setting, we recall that $f_i$ converges to $f_\infty$ at $w_\infty \in B_R(x_\infty)$ if $f_i(w_i) \to f_\infty(w_\infty)$ holds for every $w_i \to w_\infty$. See section 1.2. We denote it by $f_i \to f_\infty$ at $w_\infty$. We remark that it is easy to check that the following conditions are equivalent:

1. $f_i$ converges strongly to $f_\infty$ at $w_\infty$.
2. $f_i \to f_\infty$ at $w_\infty$.
3. $f_i$ converges weakly to $f_\infty$ at $w_\infty$.

We shall consider a convergence of the $L^2$-energy of Lipschitz functions.

**Definition 4.14** (Pointwise upper semicontinuity of $L^2$-energy). We say that $L^2$-energy of $\{f_i\}_i$ are upper semicontinuous at $w_\infty \in B_R(x_\infty)$ if for every $\epsilon > 0$, there exists $r > 0$ such that

$$\limsup_{i \to \infty} \frac{1}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} (\text{Lip} f_i)^2 d\nu \leq \frac{1}{\text{vol} B_t(w_\infty)} \int_{B_t(w_\infty)} (\text{Lip} f_\infty)^2 d\nu + \epsilon$$

for every $0 < t < r$ and every $w_i \to w_\infty$.

By the definition, if $(\text{Lip} f_i)^2$ converges weakly to $(\text{Lip} f_\infty)^2$ at $w_\infty$, then $L^2$-energy of $\{f_i\}_i$ are upper semicontinuous at $w_\infty$. We shall give the definition of a convergence of the differentials of Lipschitz functions:

**Definition 4.15** (Convergence of the differentials of Lipschitz functions). We say that $df_i$ converges to $df_\infty$ at $w_\infty \in B_R(x_\infty)$ if the following properties hold:

1. $\langle dr_{z_i}, df_i \rangle$ converges weakly to $\langle dr_{z_\infty}, df_\infty \rangle$ at $w_\infty$ for every $z_i \to z_\infty$
2. $L^2$-energy of $\{f_i\}_i$ are upper semicontinuous at $w_\infty$.

Then we denote it by $df_i \to df_\infty$ at $w_\infty$. Moreover, for a subset $A$ of $B_R(x_\infty)$, if $f_i \to f_\infty$ and $df_i \to df_\infty$ at every $a \in A$, then we denote it by $(f_i, df_i) \to (f_\infty, df_\infty)$ on $A$.

**Proposition 4.16.** Let $w_i$ be a point in $M_i$ for every $i < \infty$, and $w_\infty$ a point in $Y$ with $w_i \to w_\infty$. Then we have $(r_{w_i}, dr_{w_i}) \to (r_{w_\infty}, dr_{w_\infty})$ on $Y$.

**Proof.** It follows from Proposition 4.7 and Proposition 4.12 directly.
The following theorem is the main result in this subsection:

**Theorem 4.17.** Let \( \{g_i\}_{1 \leq i \leq \infty} \) be a sequence of Lipschitz functions \( g_i \) on \( B_R(x_i) \), and \( A \) a Borel subset of \( B_R(x_\infty) \). Assume that \( \sup_i (\text{Lip} g_i + |g_i|_{L^\infty(B_R(x_i))}) < \infty \), \( df_i \to df_\infty \) and \( dg_i \to dg_\infty \) on \( A \). Then, \( \langle df_i, dg_i \rangle \) converges strongly to \( \langle df_\infty, dg_\infty \rangle \) at a.e. \( w_\infty \in A \).

**Proof.** By Theorem 3.16 and Lemma 3.48, there exist collections of Borel subsets \( \{A_j\}_j \), of positive integers \( \{k_j\}_j \) with \( 1 \leq k_j \leq n \), and of points \( \{x_i^j\}_{j, 1 \leq i \leq k_j} \) in \( Y \) such that the following properties hold:

1. \( v(A \setminus \bigcup_{j=1}^{\infty} A_j) = 0 \) and \( A_j \subset Y \setminus \bigcup_{i=1}^{k_j} (C_i \cup \{x_i^j\}) \) for every \( j \).

2. For every \( w \in A_j \), there exists \( a_i^j, \ldots, a_{k_j}^j, b_i^j, \ldots, b_{k_j}^j \in \mathbb{R} \) such that

\[
\lim_{r \to 0} \frac{1}{v(B_r(w_\infty))} \int_{B_r(w_\infty)} \left| df_\infty - d \left( \sum_{l=1}^{k_j} a_i^j r_{x_i^j} \right) \right|^2 + \left| dg_\infty - d \left( \sum_{l=1}^{k_j} b_i^j r_{x_i^j} \right) \right|^2 \, dv = 0.
\]

Fix \( j \) and \( w_\infty \in A_j \). Let \( a_1^j, \ldots, a_{k_j}^j, b_1^j, \ldots, b_{k_j}^j \in \mathbb{R} \) as above, and \( L \geq 1 \) with \( \sup_j (\text{Lip} f_i + \text{Lip} g_i + \sum_{i=1}^{k_j} (a_i^j)^2 + (b_i^j)^2) \leq L \). Take \( \tau > 0 \) with \( w \in \bigcup_{i=1}^{k_j} (D_r \setminus B_r(x_i^j)) \). Let \( x_i^j(i) \to x_i^j \) and \( w_i \to w_\infty \). Fix \( \epsilon > 0 \). Then, there exists \( r > 0 \) such that

\[
\frac{1}{v(B_r(w_\infty))} \int_{B_r(w_\infty)} \left| df_\infty - d \left( \sum_{l=1}^{k_j} a_i^j r_{x_i^j} \right) \right|^2 + \left| dg_\infty - d \left( \sum_{l=1}^{k_j} b_i^j r_{x_i^j} \right) \right|^2 \, dv \leq \epsilon,
\]

and

\[
\limsup_{i \to \infty} \frac{1}{v(B_r(w_i))} \int_{B_r(w_i)} (\text{Lip} f_i)^2 \, dv \leq \frac{1}{v(B_r(w_\infty))} \int_{B_r(w_\infty)} (\text{Lip} f_\infty)^2 \, dv + \epsilon,
\]

\[
\limsup_{i \to \infty} \frac{1}{v(B_r(w_i))} \int_{B_r(w_i)} (\text{Lip} g_i)^2 \, dv \leq \frac{1}{v(B_r(w_\infty))} \int_{B_r(w_\infty)} (\text{Lip} g_\infty)^2 \, dv + \epsilon,
\]

and

\[
\limsup_{i \to \infty} \frac{1}{v(B_r(w_i))} \int_{B_r(w_i)} \langle df_i, dr_{x_i^j(i)} \rangle \, dv \leq \frac{1}{v(B_r(w_\infty))} \int_{B_r(w_\infty)} \langle df_\infty, dr_{x_i^j} \rangle \, dv < \epsilon
\]

for every \( l \) and every \( 0 < t < r \). Fix \( 0 < t < \min\{r, \tau\} \). Then, by Corollary 3.37, we have

\[
\frac{1}{v(B_t(w_\infty))} \int_{B_t(w_\infty)} \left| df_\infty, dg_\infty \right| - \frac{1}{v(B_t(w_\infty))} \int_{B_t(w_\infty)} \left| d \left( \sum_{l=1}^{k_j} a_i^j r_{x_i^j} \right), d \left( \sum_{l=1}^{k_j} b_i^j r_{x_i^j} \right) \right| \, dv \leq \Psi(\epsilon, n, L)
\]

for all \( 1 \leq i \leq \infty \).
Therefore, by Corollary 3.37, we have the assertion.

\[
\frac{1}{v(B_t(\infty))} \left| \langle df_\infty, dg_\infty \rangle - \frac{1}{v(B_t(w))} \left| \langle df_\infty, dg_\infty \rangle \right| dv \right| \int_{B_t(w_\infty)} \left| \langle df_\infty, dg_\infty \rangle - \frac{1}{v(B_t(w))} \left| \langle df_\infty, dg_\infty \rangle \right| dv \right| dv
\]

\[
= \frac{1}{v(B_t(\infty))} \int_{B_t(\infty)} \left| \langle df_i, d \left( \sum_{l=1}^{k_j} a_l^j r_i x_i^l \right) \rangle d \left( \sum_{l=1}^{k_j} b_i^l r_i x_i^l \right) \rangle \right| dv + \Psi(\varepsilon; n, L)
\]

On the other hand, we have

\[
\frac{1}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} \left| df_i - d \left( \sum_{l=1}^{k_j} a_l^j r_i x_i^l \right) \right|^2 d\text{vol}
\]

\[
= \frac{1}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} |df_i|^2 d\text{vol} - \sum_{l=1}^{k_j} \frac{a_l^j}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} \langle df_i, dr_i x_i^l \rangle \rangle d\text{vol}
\]

\[
+ \sum_{l,l} \frac{a_l^j a_l^j}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} \langle dr_i x_i^l, dr_i x_i^l \rangle \rangle d\text{vol}
\]

\[
\leq \frac{1}{v(B_t(\infty))} \int_{B_t(\infty)} |df_\infty|^2 dv - \sum_{l=1}^{k_j} \frac{a_l^j}{v(B_t(\infty))} \int_{B_t(\infty)} \langle df_\infty, dr_i x_i^l \rangle dv
\]

\[
+ \sum_{l,l} \frac{a_l^j a_l^j}{v(B_t(\infty))} \int_{B_t(\infty)} \langle dr_i x_i^l, dr_i x_i^l \rangle dv + \Psi(\varepsilon; n, L)
\]

\[
= \frac{1}{v(B_t(\infty))} \int_{B_t(\infty)} \left| df_\infty - d \left( \sum_{l=1}^{k_j} a_l^j r_i x_i^l \right) \right|^2 dv + \Psi(\varepsilon; n, L) \leq \Psi(\varepsilon; n, L).
\]

for every sufficiently large \(i\). Similarly, we have

\[
\frac{1}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} \left| dg_i - d \left( \sum_{l=1}^{k_j} b_i^l r_i x_i^l \right) \right|^2 d\text{vol} \leq \Psi(\varepsilon; n, L)
\]

for every sufficiently large \(i\). Especially, we have

\[
\frac{1}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} \langle df_i, dg_i \rangle - \frac{1}{\text{vol} B_t(w_i)} \int_{B_t(w_i)} \langle df_i, d \left( \sum_{l=1}^{k_j} a_l^j r_i x_i^l \right) \rangle \rangle d\text{vol} \rangle d\text{vol}
\]

\[
\leq \Psi(\varepsilon; n, L).
\]

Therefore, by Corollary 3.37, we have the assertion.
COROLLARY 4.18. Let $\Omega$ be a non-empty open subset of $B_R(x_\infty)$. Assume that $df_i \to df_\infty$ at a.e. $w \in \Omega$. Then $df_i \to df_\infty$ on $\Omega$.

PROOF. The assertion follows from Proposition 4.12 and Theorem 4.17.

COROLLARY 4.19. Let $\{g_i\}_{1 \leq i \leq \infty}$ be a sequence of Lipschitz functions $g_i$ on $B_R(x_i)$ with $\sup_i(\text{Lip}g_i + |g_i|_{L^\infty(B_R(x_i))}) < \infty$, and $A$ a Borel subset of $B_R(x_\infty)$. Assume that $(f_i, df_i) \to (f_\infty, df_\infty)$ and $(g_i, dg_i) \to (g_\infty, dg_\infty)$ on $A$. Then, $(f_i + g_i, d(f_i + g_i)) \to (f_\infty + g_\infty, d(f_\infty + g_\infty))$ at a.e. $w_\infty \in A$, and $(f_i g_i, d(f_i g_i)) \to (f_\infty g_\infty, d(f_\infty g_\infty))$ at a.e. $w_\infty \in A$.

PROOF. By Theorem 4.17, there exists a Borel subset $\hat{A}$ of $A$ such that $v(A \setminus \hat{A}) = 0$ and that $|df_i|^2$, $|df_i|$, and $|dg_i|^2$ converge strongly to $|df_\infty|^2$, $|df_\infty|$, and $|dg_\infty|^2$ on $\hat{A}$, respectively. Since $|d(f_i g_i)|^2 = f_i^2 |dg_i|^2 + 2 f_i g_i d(f_i, dg_i) + g_i |df_i|^2$, by Proposition 4.3, $|d(f_i g_i)|^2$ converges strongly to $f_\infty^2 |dg_\infty|^2 + 2 f_\infty g_\infty (df_\infty, dg_\infty) + g_\infty^2 |df_\infty|^2 = |d(f_\infty g_\infty)|^2$ on $\hat{A}$. On the other hand, since $d(f_i g_i) = g_i df_i + f_i dg_i$, by Proposition 4.9, $(dr_{z_i}, d(f_i g_i))$ converges weakly to $g_\infty (dr_{z_\infty}, df_\infty) + f_\infty (dr_{z_\infty}, dg_\infty) = (dr_{z_\infty}, d(f_\infty g_\infty))$ on $\hat{A}$ for every $z_i \to z_\infty$. Therefore we have $(f_i g_i, d(f_i g_i)) \to (f_\infty g_\infty, d(f_\infty g_\infty))$ on $\hat{A}$. Similarly, we have $(f_i + g_i, d(f_i + g_i)) \to (f_\infty + g_\infty, d(f_\infty + g_\infty))$ on $\hat{A}$. 

COROLLARY 4.20. Let $k$ be a positive integer, $\{A_i\}_{1 \leq i \leq \infty}$ a sequence of Borel subsets $A_i$ of $\overline{B}_R(x_i)$, $\{f^1_i, g^1_i\}_{1 \leq i \leq \infty, 1 \leq l \leq k}$ a collection of Lipschitz functions $f^l_i, g^l_i$ on $B_R(x_i)$ with $\sup_i(\text{Lip} f^l_i + \text{Lip} g^l_i) < \infty$, and $\{F_i\}_{1 \leq i \leq \infty}$ a sequence of continuous functions on $\mathbb{R}^k$. Assume that the following properties hold:

1. $F_i$ converges to $F_\infty$ with respect to the compact uniformly topology.
2. $1_{A_i}$ converges weakly to $1_{A_\infty}$ at a.e. $w_\infty \in B_R(x_\infty)$.
3. $df^1_i \to df^1_\infty$ and $dg^1_i \to dg^1_\infty$ at a.e. $w_\infty \in A_\infty$ for every $1 \leq l \leq k$.

Then we have

$$\lim_{i \to \infty} \int_{A_i} F_i((df^1_i, dg^1_i), \ldots, (df^k_i, dg^k_i)) d\nu = \int_{A_\infty} F_\infty((df^1_\infty, dg^1_\infty), \ldots, (df^k_\infty, dg^k_\infty)) d\nu.$$ 

PROOF. The assertion follows from Proposition 4.3, Proposition 4.10 and Theorem 4.17.

We shall end this subsection by giving several remarks:

REMARK 4.21. By several arguments in section 3, and the proof of Theorem 4.17, we can also show the following: Assume that the following properties hold:

1. $L^2$-energy of $\{f_i\}$, are upper semicontinuous at every $\alpha \in B_R(x_\infty)$,
2. There exist a dense subset $A$ of $B_R(x_\infty)$ and a Borel subset $\hat{A}$ of $B_R(x_\infty)$ such that $v(B_R(x_\infty) \setminus \hat{A}) = 0$ and that $\langle dr_{w_i}, df_i \rangle$ converges weakly to $\langle dr_{w_\infty}, df_\infty \rangle$ at every $\alpha \in \hat{A}$ for every $w_\infty \in A$ and every $w_i \to w_\infty$.

Then, $df_i \to df_\infty$ on $B_R(x_\infty)$.

**Remark 4.22.** Let $\{(Y_i, y_i, v_i)\}_{1 \leq i \leq \infty}$ be a sequence of Ricci limit spaces and $\{f_i\}_{1 \leq i \leq \infty}$ a sequence of Lipschitz functions $f_i$ on $B_R(y_i)$. Then, similarly, we can also define a notion of convergence: $df_i \to df_\infty$ and give several properties as above.

**Remark 4.23.** Let $(Y, y, v)$ be a Ricci limit space and $\{f_i\}_{1 \leq i \leq \infty}$ a sequence of Lipschitz functions on $B_R(y)$ with $\sup_i \Lip f_i < \infty$. Then, $df_i \to df_\infty$ on $B_R(y)$ (in the sense of Definition 4.15 with respect to the convergence $(Y, y, v)$ $(\text{id}_{Y,R_i}), (Y, y, v)$) if and only if $|\Lip(f_i - f_\infty)|_{L^2(B_R(y))} \to 0$. We shall check it below. By Corollary 4.20, it suffices to check the ‘if’ part. Assume that $|\Lip(f_i - f_\infty)|_{L^2(B_R(y))} \to 0$. Then, it is clear that $L^2$-energy of $\{f_i\}_i$ are upper semicontinuous at every $w \in B_R(y)$. On the other hand, by Proposition 4.16, we have $\lim_{i \to \infty} |\Lip(r_{x_i} - r_{x_\infty})|_{L^2(B_R(y))} = 0$ for every $x_i \to x_\infty \in Y$. Especially, $(dr_{x_i}, df_i)$ converges weakly to $\langle dr_{x_\infty}, df_\infty \rangle$ at every $w \in B_R(y)$. Thus, $df_i \to df_\infty$ on $B_R(y)$.

### 4.4 An approximation theorem

Throughout this subsection, we shall use the following notation (same to one used in previous subsection): Let $\{(M_i, m_i)\}_i$ be a sequence of pointed $n$-dimensional complete Riemannian manifolds with $\text{Ric}_{M_i} \geq -(n-1)$, $(Y, y, v)$ a Ricci limit space of $\{(M_i, m_i, \text{vol})\}_i$, $x_i$ a point in $M_i$ for every $i < \infty$, $x_\infty$ a point in $Y$ satisfying $(M_i, m_i, x_i, \text{vol})$ $(\text{id}_{Y,R_i}), (Y, y, v)$ $(Y, y, x_\infty, v)$. A purpose in this subsection is to give the following approximation theorem. Roughly speaking, it means that for a given Lipschitz function $f_\infty$ on $B_R(x_\infty)$, there exists a sequence of Lipschitz functions $f_i$ on $B_R(x_i)$ approximating the given function with respect to the topology: “$(f_i, df_i) \to (f_\infty, df_\infty)$”.

**Theorem 4.24** (Approximation theorem). Let $L, R$ be positive numbers, $f_\infty$ an $L$-Lipschitz function on $B_R(x_\infty)$, $A_\infty$ a compact subset of $B_R(x_\infty)$, $\{A_i\}_{1 \leq i \leq \infty}$ a sequence of Borel subsets $A_i$ of $B_R(x_\infty)$, and $\{f_i\}_{1 \leq i \leq \infty}$ a sequence of $L$-Lipschitz functions $f_i$ on $A_i$. Assume that $\limsup_{i \to \infty} G_{A_i} A_i \subset A_\infty$ and that $f_\infty|_{A_\infty}$ is an extension of $\{f_i\}_i$ asymptotically.

Then, for every $\epsilon > 0$, there exist an open subset $\Omega_\epsilon$ of $B_R(x_\infty) \setminus A_\infty$, and a sequence $\{f_i^\epsilon\}_{1 \leq i \leq \infty}$ of $C(n, L)$-Lipschitz functions $f_i^\epsilon$ on $B_R(x_i)$ such that $(f_i^\epsilon, df_i^\epsilon) \to (f_\infty^\epsilon, df_\infty^\epsilon)$ on $\Omega_\epsilon$, $f_i^\epsilon|_{A_i} = f_i|_{A_i}$ for every $1 \leq i \leq \infty$, and

$$\frac{v(B_R(x_\infty) \setminus (\Omega_\epsilon \cup A_\infty))}{v(B_R(x_\infty))} + |f_\infty - f_\infty^\epsilon|_{L^\infty(B_R(x_\infty))} + |\Lip(f_\infty^\epsilon - f_\infty)|_{L^2(B_R(x_\infty))} < \epsilon.$$
Proof. Fix sufficiently small $\epsilon > 0$ and $\xi > 0$ (we will decide $\xi$ later). By Lemma 3.13 and (the proof of) Theorem 3.16, there exist collections of pairwise disjoint Borel subsets $\{E_j\}_j$ of $B_R(x_\infty)$, of positive numbers $\{\tau_j\}_j$, of positive integers $\{k_j\}_j$ with $1 \leq k_j \leq n$, and of points $\{x^j_i\}_{j, 1 \leq i \leq k_j}$ in $Y$ such that the following properties hold:

1. $v_\infty(B_R(x_\infty) \setminus \bigcup_j E_j) = 0$ and $E_j \subset \bigcap_{l=1}^{k_j} \left( D^j_x \setminus B_{\tau_j}(x^j_l) \right)$ for every $j$.

2. For every $w \in E_j$, we have
   \[ \langle dr^j_x, dr^j_x \rangle(w) = \lim_{r \to 0} \frac{1}{v(B_r(w))} \int_{B_r(w)} \langle dr^j_x, dr^j_x \rangle d\nu = \delta_{i,l} \pm \epsilon. \]

3. For every $w \in E_j$, there exists $r_w > 0$ such that $r_w << \tau_j$, $\overline{B}_{10r_w}(w) \subset B_R(x_\infty)$ and
   \[ \frac{1}{v(B_r(w))} \int_{B_r(w)} | df_\infty - d \left( \sum_{l=1}^{k_j} a^j_l(w)r^j_{x^j_l} \right) |^2 d\nu < \epsilon \]
   for every $0 < t < r_w$.

Put $X = \bigcup_{j=1}^\infty (E_j \setminus \overline{B}_{5\xi}(A_\infty))$. By Proposition 2.4, there exists a pairwise disjoint collection $\{\overline{B}_{r_i}(z_i)\}_i \subset B_R(x_\infty)$ such that $z_i \in X$, $r_i << \min\{r_{z_i}, \epsilon, \xi\}$ and $X \setminus \bigcup_{i=1}^\infty \overline{B}_{r_i}(z_i) \subset \bigcup_{i=N+1}^\infty \overline{B}_{5r_i}(z_i)$ for every $N$. For every $i$, let $l(i)$ with $z_i \in E_{l(i)}$. Without loss of generality, we can assume that $l(i) = i$. Fix $N$ satisfying $\sum_{i=N+1}^\infty v(B_{r_i}(z_i)) < \epsilon$. Let $z_i(j) \to z_i$ and $x^i_m(j) \to x^i_m$. Define functions $F^i_j$ on $B_{r_i}(z_i(j))$, and $F_i$ on $B_{r_i}(z_i)$ by

\[ F^i_j = \sum_{m=1}^{k_j} a^i_m r^i_{x^i_m(j)} + C_i, \quad F_i = \sum_{m=1}^{k_i} a^i_m r^i_{x^i_m} + C_i, \]

where $C_i$ is the constant defined by satisfying $F_i(z_i) = f_\infty(z_i)$, and $a_m^i = a_m^i(z_i)$.

Claim 4.25. We have $\text{Lip} F^i_j + \text{Lip} F_i \leq C(n, L)$ for every $i, j$.

The proof is as follows. Since

\[ |df_\infty(z_i)|^2 = \sum_{s,t} a^i_s a^i_t \langle dr^j_x, dr^j_x \rangle(z_i) \]
\[ = \sum_{s,t} a^i_s a^i_t (\delta_{s,t} \pm \epsilon) \]
\[ = (1 \pm \epsilon) \sum_{s=1}^{k_i} (a^i_s)^2 \pm \Psi(\epsilon; n) \sum_{s=1}^{k_i} (a^i_s)^2 = (1 \pm \Psi(\epsilon; n)) \sum_{s=1}^{k_i} (a^i_s)^2 \]

and $|df_\infty(z_i)| \leq L$, we have $\sum_{m=1}^{k_i} (a_m^i)^2 \leq L^2 + \Psi(\epsilon; n, L)$. Therefore we have Claim 4.25.

We remark that $\{\overline{B}_{r_i}(z_i(j))\}_{1 \leq i \leq N}$ is a pairwise disjoint collection for every sufficiently large $j$. Define functions $F_j$ on $\bigcup_{m=1}^N \overline{B}_{(1-\xi)r_i}(z_i(j))$, and $F_\infty$ on $\bigcup_{m=1}^\infty \overline{B}_{(1-\xi)r_i}(z_i)$ by $F_j|_{B_{(1-\xi)r_i}(z_i(j))} = F^i_j|_{B_{(1-\xi)r_i}(z_i(j))}$, $F_\infty|_{B_{(1-\xi)r_i}(z_i)} = F_j|_{B_{(1-\xi)r_i}(z_i)}$ for every sufficiently large $j$. 

56
Claim 4.26. We have $\text{Lip} F_j + \text{Lip} F_\infty \leq C(n, L) + \xi^{-1} \Psi(\epsilon; n, L)$ for every sufficiently large $j$.

The proof is as follows. By Claim 4.25, we have $\text{Lip}(F_j)_{\overline{B}(z_l)}(z_l(j)) + \text{Lip}(F_\infty)_{\overline{B}(z_l)}(z_l) \leq C(n, L)$ for every $i, j$. Let $j_0$ satisfying that $\epsilon_j < \min \{\xi_{r_1}, \ldots, \xi_{r_N}\}$ for every $j \geq j_0$. Fix $j \geq j_0$, $1 \leq l < m \leq N$, $w_l(j) \in \overline{B}(z_l(j))$ and $w_m(j) \in \overline{B}(z_m(j))$. Since $\overline{B}(z_l(j)) \cap \overline{B}(z_m(j)) = \emptyset$, there exists $\alpha(j) \in \partial B_r(z_l)$ such that $w_l(j), \alpha(j) + \frac{1}{\alpha(j)}$, $w_m(j) = w_l(j), \alpha(j) \geq \xi r_1$. Similarly, we have $w_l(j), w_m(j) \geq \xi r_m$. Thus, we have $w_l(j), w_m(j) \geq \xi (r_l + r_m)/2$. On the other hand, since

$$\frac{1}{v(B_{10r_l}(z_l))} \int_{B_{10r_l}(z_l)} \left| \text{Lip} \left( f_\infty - \sum_{s=1}^{k_l} a_s^l r_{x_s^l} \right) \right|^2 \, dv < \epsilon,$$

by the segment inequality on limit spaces [6, Theorem 2.6], there exist points $\hat{z}_l, \phi_j(\hat{w}_l(j))$ in $B_{r_l}(z_l)$ and a minimal geodesic $\gamma$ from $\hat{z}_1$ to $\phi_j(\hat{w}_l(j))$ such that $\hat{z}_l, \hat{z}_l + \phi_j(\hat{w}_l(j)), \phi_j(\hat{w}_l(j)) < \Psi(\epsilon; n)r_l$ and

$$\int_0^{\hat{z}_l, \phi_j(\hat{w}_l(j))} \text{Lip} \left( f_\infty - \sum_{s=1}^{k_l} a_s^l r_{x_s^l} \right) (\gamma(t)) \, dt < \Psi(\epsilon; n)r_l.$$ 

Therefore we have

$$\left| f_\infty(z_l) - \sum_{s=1}^{k_l} a_s^l r_{x_s^l}(z_l) - \left( f_\infty(\phi_j(z_l(j))) - \sum_{s=1}^{k_l} a_s^l r_{x_s^l}(\phi_j(z_l(j))) \right) \right| \leq \int_0^{\hat{z}_l, \phi_j(\hat{w}_l(j))} \text{Lip} \left( f_\infty - \sum_{s=1}^{k_l} a_s^l r_{x_s^l} \right) (\gamma(t)) \, dt < \Psi(\epsilon; n)r_l.$$ 

Thus we have

$$\left| f_\infty(z_l) - \sum_{s=1}^{k_l} a_s^l r_{x_s^l}(z_l) - \left( f_\infty(\phi_j(z_l(j))) - \sum_{s=1}^{k_l} a_s^l r_{x_s^l}(\phi_j(z_l(j))) \right) \right| \leq \Psi(\epsilon; n, L)r_l.$$ 

Especially, we have $|F_j(w_l(j)) - f_\infty \circ \phi_j(w_l(j))| \leq \Psi(\epsilon; n, L)r_l$. Similarly, we have $|F_j(w_m(j)) - f_\infty \circ \phi_j(w_m(j))| \leq \Psi(\epsilon; n, L)r_m$ and $|F_\infty - f_\infty| \leq \Psi(\epsilon; n, L)r_l$ on $\overline{B}(z_l)$. Therefore we have

$$|F_j(w_l(j)) - F_j(w_m(j))| \leq \left| f_\infty \circ \phi_j(w_l(j)) - f_\infty \circ \phi_j(w_m(j)) \right| + \Psi(\epsilon; n, L)(r_l + r_m)$$

$$\leq L \phi_j(w_l(j)), \phi_j(w_m(j)) + \Psi(\epsilon; n, L)(r_l + r_m)$$

$$\leq L \phi_j(w_l(j)), \phi_j(w_m(j)) + \epsilon_j + \Psi(\epsilon; n, L)(r_l + r_m)$$

$$\leq L \phi_j(w_l(j)), \phi_j(w_m(j)) + \Psi(\epsilon; n, L)(r_l + r_m) \leq (L + \xi^{-1} \Psi(\epsilon; n, L)) w_l(j), w_m(j).$$

Thus, by Claim 4.25, we have $\text{Lip} F_j \leq C(n, L) + \xi^{-1} \Psi(\epsilon; n, L)$. Similarly, we have $\text{Lip} F_\infty \leq C(n, L) + \xi^{-1} \Psi(\epsilon; n, L)$. Therefore we have Claim 4.26.
Claim 4.27. We have \( \bigcup_{i=1}^{N} \overline{B}_{(1-\xi)r_i}(z_i(j)) \subset M_i \setminus B_{2\xi}(A_i) \) and \( \bigcup_{i=1}^{N} \overline{B}_{(1-\xi)r_i}(z_i) \subset Y \setminus B_{2\xi}(A_{\infty}) \) for every sufficiently large \( j \).

The proof is as follows. It is easy to check that \( \bigcup_{i=1}^{N} \overline{B}_{r_i}(z_i) \subset Y \setminus B_{2\xi}(A_{\infty}) \). On the other hand, by the assumption, there exists \( i_0 \) such that \( \phi_i(A_i) \subset B_\xi(A_{\infty}) \) and \( \epsilon_i < \min_{1 \leq j \leq N} \{ \xi r_j \} \) for every \( i \geq i_0 \). Thus, since \( \phi_i \left( \bigcup_{i=1}^{N} \overline{B}_{(1-\xi)r_i}(z_i(j)) \right) \subset \bigcup_{i=1}^{N} \overline{B}_{r_i}(z_i) \subset Y \setminus B_{2\xi}(A_{\infty}) \) for every \( i \geq i_0 \), we have Claim 4.27.

Claim 4.28. We have

\[
\lim_{i \to \infty} \sup_{A_i} |f_i - f_{\infty} \circ \phi_i| = 0.
\]

The proof is by a contradiction. Assume that the assertion is false. Then, there exist \( \tau > 0 \), a subsequence \( \{ n(i) \} \) of \( N \), and \( \alpha_{n(i)} \in A_{n(i)} \) such that \( |f_{n(i)}(\alpha_{n(i)}) - f_{\infty} \circ \phi_{n(i)}(\alpha_{n(i)})| > \tau \). Without loss of generality, we can assume that there exists \( \alpha_{\infty} \in Y \) such that \( \phi_{n(i)}(\alpha_{n(i)}) \to \alpha_{\infty} \). Thus, \( \liminf_{i \to \infty} |f_{n(i)}(\alpha_{n(i)}) - f_{\infty}(\alpha_{\infty})| \geq \tau \). On the other hand, we have \( \alpha_{\infty} \in A_{\infty} \). Since \( f_{\infty}|_{A_{\infty}} \) is an extension of \( \{ f_i \} \) asymptotically, this is a contradiction. Therefore we have Claim 4.28.

Put \( W_j = \bigcup_{m=1}^{N} B_{(1-\xi)r_i}(z_i(j)) \) and \( W_{\infty} = \bigcup_{m=1}^{N} B_{(1-\xi)r_i}(z_i) \). By Claim 4.27, we can define Lipschitz functions \( G_j \) on \( W_j \cup A_j \), and \( G_{\infty} \) on \( W_{\infty} \cup A_{\infty} \) by \( G_j|_{W_j} = F_j|_{W_j} \), \( G_j|_{A_j} = f_j \), \( G_{\infty}|_{W_{\infty}} = F_{\infty}|_{W_{\infty}} \) and \( G_{\infty}|_{A_{\infty}} = f_{\infty}|_{A_{\infty}} \) for every sufficiently large \( j \).

Claim 4.29. We have \( \text{Lip} G_j + \text{Lip} G_{\infty} \leq C(n, L) + \xi^{-1} \Psi(\epsilon; n, L) \) for every sufficiently large \( j \).

The proof is as follows. Put \( \xi_j = \sup_{A_j} |f_j - f_{\infty} \circ \phi_j| \). Then by the proof of Claim 4.26, there exists \( j_0 \) such that

\[
|G_j(\alpha_j) - G_j(\beta_j)| = |F_j(\alpha_j) - f_j(\beta_j)| \\
\leq |f_{\infty} \circ \phi_j(\alpha_j) - f_{\infty} \circ \phi_j(\beta_j)| + \Psi(\epsilon; n, L)r_i + \xi_j \\
\leq |f_{\infty} \circ \phi_j(\alpha_j) - f_{\infty} \circ \phi_j(\beta_j)| + \Psi(\epsilon; n, L)r_i + \xi_j \\
\leq L\phi_j(\alpha_j), \phi_j(\beta_j) + \Psi(\epsilon; n, L)r_i \\
\leq L(\alpha_j, \beta_j + \epsilon_j) + \Psi(\epsilon; n, L)\xi_j \leq (L + \Psi(\epsilon; n, L))\alpha_{\infty, \beta_{\infty}}.
\]

for every \( j \geq j_0 \), every \( \alpha_j \in \overline{B}_{(1-\xi)r_i}(z_i(j)) \) and every \( \beta_j \in A_j \). Therefore, by Claim 4.26, we have \( \text{Lip} G_j \leq C(n, L) + \xi^{-1} \Psi(\epsilon; n, L) \) for every sufficiently large \( j \). Similarly, we have \( \text{Lip} G_{\infty} \leq C(n, L) + \xi^{-1} \Psi(\epsilon; n, L) \). Thus, we have Claim 4.29.

For \( \Psi = \Psi(\epsilon; n, L) \) as in Claim 4.29, put \( \xi = \sqrt{\Psi} \). Let \( f_j^\epsilon \) be a Lipschitz function on \( M_j \) and \( f_{\infty}^\epsilon \) a Lipschitz function on \( Y \) satisfying that \( \text{Lip} f_j^\epsilon = \text{Lip} G_j \), \( \text{Lip} f_{\infty}^\epsilon = \text{Lip} G_{\infty} \), \( f_j^\epsilon|_{W_j \cup A_j} = F_j|_{W_j \cup A_j} \) and \( f_{\infty}^\epsilon|_{W_{\infty} \cup A_{\infty}} = F_{\infty}|_{W_{\infty} \cup A_{\infty}} \). Put \( \Omega_\epsilon = W_{\infty} \). Then, by Proposition 4.16 and Corollary 4.19, we have \( (f_i^\epsilon, d_i^\epsilon) \to (f_{\infty}^\epsilon, d_{\infty}^\epsilon) \) on \( \Omega_\epsilon \). On the other hand, we
have \( v(B_R(x_\infty) \setminus (\Omega_\epsilon \cup A_\infty)) \leq v(X \setminus \Omega_\epsilon) + v(\overline{B}_\infty(A_\infty) \setminus A_\infty) \leq \sum_{i=N+1}^{\infty} v(B_{5r_i}^i(z_i)) + v(\overline{B}_\infty(A_\infty) \setminus A_\infty) + \Psi(\epsilon; n, L) \) and
\[
\int_{B^i_R(x_\infty)} |df_\infty - df^i_\infty|^2 dv \leq \int_X |df_\infty - df^i_\infty|^2 dv + \int_{\overline{B}_\infty(A_\infty)} |df_\infty - df^i_\infty|^2 dv
\]
\[
\leq \sum_{i=1}^{N} \int_{B_{(1-\epsilon)r_i}^i(z_i)} |df_\infty - df^i_\infty|^2 dv + 5L^2 v(\overline{B}_\infty(A_\infty) \setminus A_\infty) + \int_{A_\infty} |df^i_\infty - df_\infty|^2 dv + \Psi(\epsilon; n, L)
\]
\[
\leq \sum_{i=1}^{N} \epsilon v(B_{(1-\epsilon)r_i}^i(z_i)) + 5L^2 v(\overline{B}_\infty(A_\infty) \setminus A_\infty) + \Psi(\epsilon; n, L)
\]
\[
\leq \epsilon v(B_R(x_\infty)) + 5L^2 v(\overline{B}_\infty(A_\infty) \setminus A_\infty) + \Psi(\epsilon; n, L).
\]

We remark that since \( A_\infty \) is compact, we have \( \lim_{r \to 0} v(B_r(A_\infty) \setminus A_\infty) = 0 \). Put \( \tau(r) = v(B_r(A_\infty) \setminus A_\infty) \). On the other hand, by the proof of Claim 4.26, we have \( |f^i_\infty - f_\infty| < \Psi(\epsilon; n, L) \) on \( \Omega_\epsilon \cup A_\infty \). For every \( w \in B_R(x_\infty) \), there exists \( \tilde{w} \in \Omega_\epsilon \cup A_\infty \) such that \( w, \tilde{w} < \Psi(\epsilon, 5\xi; n, L, v(B_R(x_\infty))) \). Therefore, we have \( |f^i_\infty(w) - f_\infty(w)| \leq |f^i_\infty(\tilde{w}) - f_\infty(\tilde{w})| + \Psi(\epsilon, 5\xi; n, L, v(B_R(x_\infty))) \). Thus, we have \( |f^i_\infty - f_\infty| < \Psi(\epsilon, 5\xi; n, L, v(B_R(x_\infty))) \) on \( B_R(x_\infty) \). Since it is not difficult to check that \( |\text{Lip}(f^i_\infty - f_\infty)|_{L^2(B_R(x_\infty))} \leq \Psi(\epsilon; n, L, R, v(B_R(x_\infty))) \), we have the assertion.

By using Theorem 4.24, we shall give a sufficient condition to satisfy pointwise upper semicontinuity of \( L^2 \)-energy:

**Proposition 4.30.** Let \( R \) be a positive number, \( f_i \) a \( C^2 \)-function on \( B_R(x_i) \) for every \( i < \infty \), and \( f_\infty \) a Lipschitz function on \( \overline{B}_R(x_\infty) \). Assume that
\[
\sup_i \left( \text{Lip} f_i + \int_{B_R(x_i)} |\Delta f_i| dvol \right) < \infty
\]
and \( f_i \to f_\infty \) on \( B_R(x_\infty) \). Then, we have
\[
\limsup_{i \to \infty} \int_{B_R(x_i)} (\text{Lip} f_i)^2 dvol \leq \int_{B_R(x_\infty)} (\text{Lip} f_\infty)^2 dv.
\]
Especially, \( L^2 \)-energy of \( \{f_i\}_i \) are upper semicontinuous at every \( w \in B_R(x_\infty) \).

**Proof.** Let \( g_i = \Delta f_i \). First, we shall remark the following:

**Claim 4.31.** We have
\[
\int_{B_R(x_i)} |d(f_i + k)| dvol - 2 \int_{B_R(x_i)} g_i f_i dvol \geq \int_{B_R(x_i)} |d f_i|^2 dvol - 2 \int_{B_R(x_i)} g_i f_i dvol
\]
for every Lipschitz function \( k \) on \( B_R(x_i) \), which has compact support.
Claim 4.31 follows from the equality:

\[
\int_{B_R(x_i)} |d(f_i + k)|^2 d\nu - 2 \int_{B_R(x_i)} g_i(f_i + k)d\nu = \int_{B_R(x_i)} |df_i|^2 d\nu - 2 \int_{B_R(x_i)} g_i f_i d\nu + \int_{B_R(x_i)} |dk|^2 d\nu.
\]

Fix \( \epsilon > 0 \). Let \( L \geq 1 \) with

\[
\sup_i \left( \text{Lip}f_i + |f_i|_{L^\infty(B_B(x_i))} + \int_{B_B(x_i)} |g_i| d\nu \right) < L.
\]

Since \( \limsup_{i \to \infty} A_{R-R,R}(x_i) \subset A_{R-R,R}(x_\infty) \), by Theorem 4.24, there exist a sequence \( \{f_i^j\}_{1 \leq i \leq \infty} \) of \( C(n, L) \)-Lipschitz functions \( f_i^j \) on \( B_B(x_i) \), and an open set \( \Omega_\epsilon \subset B_B(x_\infty) \) \( \backslash \) \( A_{R-R,R}(x_\infty) \) such that \( f_i^j|_{A_{R-R,R}(x_i)} = f_i|_{A_{R-R,R}(x_i)} \) for every \( 1 \leq i \leq \infty \), \( (f_i^j, df_i^j) \to (f^\infty, df^\infty) \) on \( \Omega_\epsilon \), and

\[
u(B_B(x_\infty) \backslash (\Omega_\epsilon \cup A_{R-R,R}(x_\infty))) + |f_\infty - f^\infty|_{L^\infty(B_B(x_\infty))} + |\text{Lip}(f^\infty - f_\infty)|_{L^2(B_B(x_\infty))} < \epsilon.
\]

By Claim 4.31, we have

\[
\int_{B_B(x_i)} |df_i|^2 d\nu - 2 \int_{B_B(x_i)} g_i f_i d\nu \geq \int_{B_B(x_i)} |df_i|^2 d\nu - 2 \int_{B_B(x_i)} g_i f_i d\nu.
\]

By Proposition 2.4, without loss of generality, we can assume that there exists a pairwise disjoint finite collection \( \{\overline{B}_R(z_i)\}_{1 \leq i \leq N} \) such that \( \Omega_\epsilon = \bigcup_{i=1}^N B_R(z_i) \). Let \( z_i(j) \to z_i \).

Put \( \Omega_\epsilon(j) = \bigcup_{i=1}^N B_R(z_i(j)) \). Since \( \nu(\Omega_\epsilon(j) \cup A_{R-R,R}(x_j)) / \nu B_R(x_j) \geq 1 - \epsilon \) for every sufficiently large \( j \), by Proposition 4.12, we have

\[
\int_{B_B(x_j)} |df_j^\infty|^2 d\nu - \int_{B_B(x_\infty)} |df_\infty|^2 d\nu < \Psi(\epsilon; n, L, R).
\]

On the other hand, since \( \sup_{B_B(x_j)} |f_j^\infty - f_j| \leq C(n, R, L) \sup_{\Omega_\epsilon(j)} |f_j^\infty - f_j| \) and \( \limsup_{j \to \infty} \sup_{\Omega_\epsilon(j)} |f_j^\infty - f_j| \leq \sup_{\Omega_\epsilon} |f^\infty - f_\infty| \), we have

\[
\int_{B_B(x_j)} g_j f_j^\infty d\nu - \int_{B_B(x_j)} g_j f_j d\nu \leq \sup_{B_B(x_j)} |f_j^\infty - f_j| \int_{B_B(x_j)} |g_j| d\nu \leq \Psi(\epsilon; n, R, L)
\]

for every sufficiently large \( j \). Therefore, we have

\[
\limsup_{i \to \infty} \int_{B_B(x_i)} |df_i|^2 d\nu \leq \int_{B_B(x_\infty)} |df_\infty|^2 d\nu + \Psi(\epsilon; n, L, R).
\]

By letting \( \epsilon \to 0 \), we have the assertion. \( \Box \)

Next corollary follows from Remark 4.6 and Proposition 4.30 directly.

60
Corollary 4.32. Let \( R \) be a positive number, \( f_i \) a \( C^2 \)-function on \( B_R(x_i) \) for every \( i < \infty \), and \( f_\infty \) a Lipschitz function on \( B_R(x_\infty) \). Assume that
\[
\sup_i \left( \text{Lip} f_i + \int_{B_R(x_i)} |\Delta f_i|^2 d\text{vol} \right) < \infty
\]
and \( f_i \to f_\infty \) on \( B_R(x_\infty) \). Then, we have \((f_i, df_i) \to (f_\infty, df_\infty)\) on \( B_R(x_\infty) \).

Next we shall consider a convergence of the equations \( \Delta f_i = g_i \) with respect to the measured Gromov-Hausdorff convergence:

Corollary 4.33. Let \( R \) be a positive number, \( f_i \) a \( C^2 \)-function on \( B_R(x_i) \) for every \( i < \infty \), and \( f_\infty \) a Lipschitz function on \( B_R(x_\infty) \) with \( \sup_i (\text{Lip} f_i + |f_i|_{L^\infty(B_R(x_i))} + |\Delta f_i|_{L^\infty(B_R(x_i))}) < \infty \). Assume that \( f_i \to f_\infty \) on \( B_R(x_\infty) \) and that there exists a \( L^\infty \)-function \( g_\infty \) on \( B_R(x_\infty) \) such that \( \Delta f_i \) converges weakly to \( g_\infty \) a.e. \( w \in B_R(x_\infty) \). Then, we have
\[
\int_{B_R(x_\infty)} \langle df_\infty, dk_\infty \rangle d\nu = \int_{B_R(x_\infty)} k_\infty g_\infty d\nu
\]
for every Lipschitz function \( k_\infty \) on \( B_R(x_\infty) \), which has compact support.

Proof. By Corollary 4.32, we have \((f_i, df_i) \to (f_\infty, df_\infty)\) on \( B_R(x_\infty) \). Let \( L \geq 1 \) with \( \sup_i (\text{Lip} f_i + |f_i|_{L^\infty(B_R(x_i))} + |\Delta f_i|_{L^\infty(B_R(x_i))}) < \infty \). Put \( r = \sup_{w \in \text{supp} k_\infty} \frac{|x_\infty - w|}{1 + |x_\infty - w|} \) and \( g_i = \Delta f_i \). Then, we have \( r < R \). Fix \( \epsilon > 0 \) with \( \epsilon < R - r \). By Theorem 4.24, there exist a sequence \( \{k_i^\epsilon\}_{1 \leq i \leq \infty} \) of \( C(n, L) \)-Lipschitz functions \( k_i^\epsilon \) on \( B_R(x_i) \), and an open set \( \Omega_\epsilon \subset B_R(x_\infty) \setminus A_{R-\epsilon, R}(x_\infty) \) such that \( k_i^\epsilon|_{A_{R-\epsilon, R}(x_i)} = 0 \) for every \( 1 \leq i \leq \infty \), \((k_i^\epsilon, dk_i^\epsilon) \to (k_\infty, dk_\infty)\) on \( \Omega_\epsilon \) and
\[
\frac{v(B_R(x_\infty) \setminus (\Omega_\epsilon \cup A_{R-\epsilon, R}(x_\infty)))}{v(B_R(x_\infty))} + |k_\infty - k_i^\epsilon|_{L^2(B_R(x_\infty))} + |\text{Lip}(k_i^\epsilon - k_\infty)|_{L^2(B_R(x_\infty))} < \epsilon.
\]
By Proposition 4.9, \( k_i^\epsilon g_i \) converges weakly to \( k_\infty^\epsilon g_\infty \) at a.e. \( w \in \Omega_\epsilon \). By an argument similar to the proof of Proposition 4.30, and Proposition 4.12, we have
\[
\left| \int_{B_R(x_i)} \langle df_i, dk_i^\epsilon \rangle d\text{vol} - \int_{B_R(x_\infty)} \langle df_\infty, dk_\infty^\epsilon \rangle d\nu \right| + \int_{B_R(x_i)} g_i k_i^\epsilon d\text{vol} - \int_{B_R(x_\infty)} g_\infty k_\infty^\epsilon d\nu < \Psi(\epsilon; n, L, R)
\]
for every sufficiently large \( i \). Since
\[
\int_{B_R(x_i)} \langle df_i, dk_i^\epsilon \rangle d\text{vol} = \int_{B_R(x_i)} g_i k_i^\epsilon d\text{vol},
\]
we have
\[
\int_{B_R(x_\infty)} \langle df_\infty, dk_\infty^\epsilon \rangle d\nu = \int_{B_R(x_\infty)} g_\infty k_\infty^\epsilon d\nu \pm \Psi(\epsilon; n, L, R).
\]
By letting \( \epsilon \to 0 \), we have the assertion. \( \square \)
We shall recall the notion of $(\mathcal{L})$-harmonic for Lipschitz functions on Ricci limit spaces. For a Lipschitz function $f$ on $B_R(x_\infty)$, we say that $f$ is harmonic on $B_R(x_\infty)$ if
\[
\int_{B_R(x_\infty)} |df|^2 dv \leq \int_{B_R(x_\infty)} |d(f+k)|^2 dv
\]
for every Lipschitz function $k$ on $B_R(x_\infty)$ which has compact support. We remark that the notion of harmonic function for $H_{1,2}$-functions is well-defined. See section 7 in [2]. The following corollary follows from Corollary 4.32 and 4.33 directly. See also [11].

**Corollary 4.34.** Let $R$ be a positive number, $f_i$ a harmonic function on $B_R(x_i)$ for every $i < \infty$, and $f_\infty$ a Lipschitz function on $B_R(x_\infty)$ with $\sup_i \text{Lip} f_i < \infty$. Assume that $f_i \to f_\infty$ on $B_R(x_\infty)$. Then, we have $(f_i, df_i) \to (f_\infty, df_\infty)$ on $B_R(x_\infty)$. Moreover, we have
\[
\int_{B_R(x_\infty)} (df_\infty, dk_\infty) dv = 0
\]
for every Lipschitz function $k_\infty$ on $B_R(x_\infty)$, which has compact support. Especially $f_\infty$ is harmonic on $B_R(x_\infty)$.

## 5 Appendix: A proof of Claim 3.24

In this appendix, we shall give a proof of Claim 3.24. Define functions $\pi_1$, $f_r^A$ on $\mathbb{R}^k$ by $\pi_1((x_1, \ldots, x_k)) = x_1$, $f_r^A(x) = H^{k-1}(\mathcal{B}_r(x) \cap A \cap \pi_1^{-1}(\pi_1(x))) 1_A(x)$. We remark that by the definition of $sl_1 - \text{Leb} A$,
\[
sl_1 - \text{Leb} A = \left\{ a = (a_1, \ldots, a_k) \in A; \liminf_{r \to 0} \frac{H^{k-1}(\mathcal{B}_r(a) \cap A \cap \pi_1^{-1}(\pi_1(a)))}{\omega_{k-1} r^{k-1}} = 1 \right\}.
\]
First, assume that $A$ is compact.

**Claim 5.1.** The function $f_r^A$ is an upper semi-continuous function on $\mathbb{R}^k$. Especially, $f_r^A$ is a $H^k$-measurable function.

**Proof.** Let $\{x_i\}_{1 \leq i \leq \infty}$ be a sequence of points in $\mathbb{R}^k$ with $x_i \to x_\infty$. It suffices to check that $\limsup_{i \to \infty} f_r^A(x_i) \leq f_r^A(x_\infty)$ under the assumption: $x_j \in A$ for every $j$. Fix $\delta > 0$. Let $\{n(i)\}_{i \in \mathbb{N}}$ be a subsequence of $\mathbb{N}$ satisfying $\lim_{j \to \infty} H^{k-1}(\mathcal{B}_r(x_{n(j)}) \cap A \cap \pi_1^{-1}(\pi_1(x_{n(j)}))) = \limsup_{i \to \infty} H^{k-1}(\mathcal{B}_r(x_{j}) \cap A \cap \pi_1^{-1}(\pi_1(x_{i})))$. On the other hand, since $\{\mathcal{B}_r(x_{n(j)}) \cap A \cap \pi_1^{-1}(\pi_1(x_{n(j)}))\}_j$ is precompact with respect to the Hausdorff distance on $\mathbb{R}^k$, without loss of generality, we can assume that there exists a compact subset $K_\infty$ of $\mathbb{R}^k$ such that $\mathcal{B}_r(x_{n(j)}) \cap A \cap \pi_1^{-1}(\pi_1(x_{n(j)}))$ converges to $K_\infty$ with respect to the Hausdorff distance on $\mathbb{R}^k$. Then, it is easy to check $K_\infty \subset \mathcal{B}_r(x_\infty) \cap A \cap \pi_1^{-1}(\pi_1(x_\infty))$. There exists a finite collection $\{B_r(y_i)\}_{1 \leq i \leq N}$ such that $r_i << \delta$, $\mathcal{B}_r(x_\infty) \cap A \cap \pi_1^{-1}(\pi_1(x_\infty)) \subset \bigcup_{i=1}^N B_r(y_i)$ and
Thus, we have Claim 3.24. Lebesgue differentiation theorem and Fubini’s theorem, we have the statements 2 and 3. Thus, we have the statement 3. Therefore, we have Claim 3.24 if $A$ is compact. 

By Claim 5.1, we have the statement 1 in Claim 3.24. The statement 2 follows from Lebesgue differentiation theorem on Euclidean spaces. Finally, by Fubini’s theorem, we have

$$ H^k(A \setminus sl_1 - \text{Leb}A) = \int_R H^{k-1}(A \cap (\{t\} \times \mathbb{R}^{k-1}) \setminus sl_1 - \text{Leb}A) \ dt = 0. $$

Thus, we have the statement 3. Therefore, we have Claim 3.24 if $A$ is compact.

We shall give a proof of Claim 3.24 in general case. Fix $R > 0$. There exists a sequence of compact subsets $\{K_i\}$ of $B_R(0_k) \cap A$ such that $H^k(B_R(0_k) \cap A \setminus K_i) \to 0$. Then, we have

$$ sl_1 - \text{Leb}K_i \subset sl_1 - \text{Leb}(B_R(0_k) \cap A). $$

Thus, we have

$$ H^k(B_R(0_k) \cap A \setminus sl_1 - \text{Leb}(B_R(0_k) \cap A)) \leq H^k(B_R(0_k) \cap A \setminus sl_1 - \text{Leb}K_i) \leq H^k(B_R(0_k) \cap A \setminus K_i) + H^k(K_i \setminus sl_1 - \text{Leb}K_i) \xrightarrow{i \to \infty} 0 $$

as an outer measure. Thus, $sl_1 - \text{Leb}(B_R(0_k) \cap A)$ is a $H^k$-measurable set. Since

$$ sl_1 - \text{Leb}A = \bigcup_{N \in \mathbb{N}} (sl_1 - \text{Leb}(A \cap B_N(0))), $$

we have the statement 1 in Claim 3.24. By Lebesgue differentiation theorem and Fubini’s theorem, we have the statements 2 and 3. Thus, we have Claim 3.24.
