THE VANISHING CYCLES OF TYPES $A_{\frac{1}{2}\infty}$ AND $D_{\frac{1}{2}\infty}$

KYOJI SAITO

ABSTRACT. We introduce two real entire functions $f_{A_{\frac{1}{2}\infty}}$ and $f_{D_{\frac{1}{2}\infty}}$ in two variables, having only two critical values 0 and 1. Associated maps $C^{2} \rightarrow C$ define topologically locally trivial fibrations over $C\setminus\{0,1\}$. The critical points over 0 and 1 are ordinary double points, whose associated vanishing cycles in the generic fiber span its middle homology group and their intersection diagram forms the bi-partite decomposition of quivers of type $A_{\frac{1}{2}\infty}$ and $D_{\frac{1}{2}\infty}$, respectively. Coxeter element of type $A_{\frac{1}{2}\infty}$ and $D_{\frac{1}{2}\infty}$ are introduced as the product of the monodromies of the fibrations around 0 and 1. We describe the spectra of the intersection form (normalized in the interval $[0,4]$) and the Coxeter elements (normalized in the interval $(-\frac{1}{2},\frac{1}{2})$).

The present note is taken from the abstract of a preprint of the author: RIMS-1710 (Jan. 2011), Coxeter elements for vanishing cycles of types $A_{\frac{1}{2}\infty}$ and $D_{\frac{1}{2}\infty}$, which is going to appear elsewhere.
