1 Introduction

We consider the Cauchy problem for the following semilinear heat equation:

$$\begin{cases} \frac{\partial u}{\partial t} = \Delta u + u^p, & (x, t) \in \mathbb{R}^n \times (0, \infty), \\ u(x, 0) = \phi(x) \geq 0, & x \in \mathbb{R}^n, \end{cases}$$ (1)

where $\Delta$ is the $n$-dimensional Laplacian, $n \in \mathbb{N}$, $p > 1$, and $\phi$ is a bounded continuous function on $\mathbb{R}^n$.

Existence and nonexistence results for time-global solutions of (1) are well-known. Here, we put $p_F = 1 + 2/n$.

• Let $p \in (1, p_F]$. Then every nontrivial solution of (1) blows up in finite time.
\begin{itemize}
  \item Let $p \in (p_F, \infty)$. Then (1) has a time-global classical solution for small initial data $\phi$, and has a blowing up solution for large or slowly decaying initial data $\phi$.
  \item Let $p \in (0, 1)$. Then the solution of (1) exists globally.
\end{itemize}

For slowly decaying initial data, in [7] Lee and Ni showed a sufficient condition for finite time blow up on the decay order of initial data.

**Theorem 1.1** ([7]). *The solution of the equation (1) blows up in finite time if*

\[
\lim_{x \to \infty} \inf |x|^{2/(p-1)} \phi(x) > \mu_1^{1/(p-1)},
\]

*where $\mu_R$ is the first Dirichlet eigenvalue of $-\Delta$ in the ball $B_R$.*

We put $\Omega = \{(r, \omega) \in (0, \infty) \times \mathbb{S}^{n-1}; \ r > R, d(\omega, \omega_0) < cr^{-\mu}\}$ for some $R > 0$, $c > 0$, $\omega_0 \in \mathbb{S}^{n-1}$, and $0 \leq \mu < 1$, where $d(\cdot, \cdot)$ denotes the usual distance on the unit sphere $\mathbb{S}^{n-1}$. Mizoguchi and Yanagida [8] showed a sufficient condition for finite time blow up on the decay order of initial data in $\Omega$.

**Theorem 1.2** ([8]). *Assume that initial data $\phi$ is nonnegative. Suppose that $\phi \in L^\infty(\mathbb{R}^n)$ satisfies

\[
\phi \geq K_1 r^{-\alpha} \text{ in } \Omega \text{ for some } \alpha > 0 \text{ and } K_1 > 0,
\]

*with $0 < \alpha < 2(1 - \mu)/(p - 1)$. Then the solution of (1) blows up in finite time.*

We remark that from the theorem, in particular, for nondecaying initial data the solution of (1) blows up in finite time, and that the slow decay of initial data in all directions is not necessary for finite time blow up.
2 Known results for life span

In this section, we introduce several known results for the life span of solutions for (1). Here, we define the life span $T_{\max}$ as

$$T_{\max} := \sup\{T > 0 | \text{The problem possesses a unique classical solution in } \mathbb{R}^n \times [0, T)\}.$$ 

First, we introduce the results for the life span for the equation with large or small initial data. We consider the following Cauchy problem:

$$\begin{cases} \frac{\partial u}{\partial t} = \Delta u + u^p, & (x, t) \in \mathbb{R}^n \times (0, \infty), \\ u(x, 0) = \lambda \psi(x) \geq 0 & x \in \mathbb{R}^n, \end{cases}$$

(2)

where $n \in \mathbb{N}$, $p > 1$. Let $\psi$ be a bounded continuous function on $\mathbb{R}^n$ and $\lambda$ be a positive parameter.

In [7], Lee and Ni showed the asymptotic behavior of the life span $T_{\max}(\lambda)$ for (2) as large or small $\lambda$.

**Theorem 2.1** ([7]). Assume that $\psi$ is nonnegative.

(i) There exist constants $C_1 > 0$ and $C_2 > 0$ such that $C_1 \lambda^{1-p} \leq T_{\max}(\lambda) \leq C_2 \lambda^{1-p}$ for large $\lambda$.

(ii) If $\lim\inf_{|x| \to \infty} \psi(x) > 0$, then there exist constants $C_1 > 0$ and $C_2 > 0$ such that $C_1 \lambda^{1-p} \leq T_{\max}(\lambda) \leq C_2 \lambda^{1-p}$ for small $\lambda$.

In [6], Gui and Wang obtained more detailed information of the asymptotics for (2). The following result indicates that for large $\lambda$ the supremum of initial data $\phi$ is dominant in the asymptotics, and that for small $\lambda$ the limiting value of $\phi$ at space infinity is dominant.

**Theorem 2.2** ([6]). Assume that $\psi$ is nonnegative.

(i) We have

$$\lim_{\lambda \to \infty} T_{\max}(\lambda) \cdot \lambda^{p-1} = \frac{1}{p-1} \|\psi\|_{L^\infty(\mathbb{R}^n)}^{1-p}$$
(ii) If \( \lim_{|x|\to\infty} \psi(x) = \psi_{\infty} > 0 \), then
\[
\lim_{\lambda \to 0} T_{\text{max}}(\lambda) \cdot \lambda^{p-1} = \frac{1}{p-1} \psi_{\infty}^{1-p}.
\]

The proof of the theorem is based on Kaplan’s method, and the assumption \( \lim_{|x|\to\infty} \psi(x) = \psi_{\infty} \) plays an important role in the proof.

Next, we discuss the life span for the equation with large diffusion. We shall consider the following Cauchy problem:
\[
\begin{cases}
\frac{\partial' u}{\partial t} = D \Delta u + |u|^{p-1}u, & (x,t) \in \mathbb{R}^n \times (0,\infty), \\
u(x,0) = \lambda + \phi(x) & x \in \mathbb{R}^n,
\end{cases}
\]
where \( D > 0, \ p > 1, \ n \geq 3, \ \lambda > 0, \) and \( \phi \in L^\infty(\mathbb{R}^n) \cap L^1(\mathbb{R}^n,(1+|x|)^2dx) \).

In [1, 2] Fujishima and Ishige obtained the asymptotics of the life span \( T_{\text{max}}(D) \) of the solution of (3) as \( D \to \infty \). We prepare the following notation:
\[
M(\phi) := \int_{\mathbb{R}^n} \phi(x)dx, \quad \Xi(\phi) := \int_{\mathbb{R}^n} x\phi(x)dx, \quad S_\lambda := \frac{\lambda^{1-p}}{p-1}.
\]

**Theorem 2.3** ([1, 2]). (i) Assume \( M(\phi) > 0 \). Then \( T_{\text{max}}(D) \leq S_\lambda \) for any \( D > 0 \), and
\[
S_\lambda - T_{\text{max}}(D) = \left(4\pi S_\lambda\right)^{-n/2}(D^{-n/2}[M(\phi) + O(D^{-1})]
\]
as \( D \to \infty \).

(ii) Assume \( M(\phi) = 0 \). Then \( T_{\text{max}}(D) \leq S_\lambda \) for any \( D > 0 \), and
\[
S_\lambda - T_{\text{max}}(D) = \frac{(4\pi S_\lambda)^{-n/2}}{\lambda^{p/2}S_\lambda^{(n-1)/2}} D^{(-n-1)/2} [\Xi(\phi) + O(D^{-1/2})]
\]
as \( D \to \infty \).

(iii) Assume \( M(\phi) < 0 \). Then \( T_{\text{max}}(D) \leq S_\lambda \) for any \( D > 0 \), and
\[
S_\lambda - T_{\text{max}}(D) = O(D^{-\frac{n}{2}-1})
\]
as \( D \to \infty \).
We remark that the problem with large diffusion is equivalent to the equation with small initial data by changing variable.

At last, we discuss the life span for the following parabolic equations (cf. [3, 4, 5, 10, 11]):

\[
\begin{aligned}
\frac{\partial u}{\partial t} = \Delta u + f(u), & \quad (x, t) \in \mathbb{R}^n \times (0, \infty), \\
u(x, 0) = \phi(x) \geq 0, & \quad x \in \mathbb{R}^n,
\end{aligned}
\]

(4)

where \(\phi\) is a bounded continuous function on \(\mathbb{R}^n\). Suppose that

\[
\begin{aligned}
f \text{ is locally Lipschitz function in } [0, \infty), \\
f(\xi) > 0 \quad (\xi > 0), \\
\int_1^{\infty} \frac{d\xi}{f(\xi)} < \infty.
\end{aligned}
\]

From the comparison principle to (4), we easily see

\[
T_{\max} \geq \int_{\|\phi\|_{L^\infty(\mathbb{R}^n)}}^{\infty} \frac{d\xi}{f(\xi)}.
\]

When \(f(u) = u^p\), we always have

\[
T_{\max} \geq \frac{1}{p - 1} \|\phi\|_{L^\infty(\mathbb{R}^n)}^{1 - p}.
\]

A solution \(u\) to (4) with initial data \(\phi\) is said to blow up at minimal blow-up time provided that

\[
T_{\max} = \int_{\|\phi\|_{L^\infty(\mathbb{R}^n)}}^{\infty} \frac{d\xi}{f(\xi)}.
\]

We put \(\rho(x) := e^{-|x|}/(\int_{\mathbb{R}^n} e^{-|y|}dy)\) and \(A_\rho(x; \phi) := \int_{\mathbb{R}^n} \rho(y - x)\phi(y)dy\). In [3], Giga, Seki and Umeda obtained the necessary and sufficient conditions of initial data \(\phi\) for blowing up at minimal blow-up time.
Theorem 2.4 ([3]). Let $u$ be a solution of (4). Assume that there exist constants $\xi_0 > 0$ and $p > 1$ such that $f(\xi)/\xi^p$ is nondecreasing for $\xi \geq \xi_0$. Then $u$ blows up at minimal blow-up time iff one of the following two conditions for initial data $\phi$ holds:

There exists a sequence $\{x_n\} \subset \mathbb{R}^n$ such that

$$|x_n| \to \infty \text{ and } \phi(x + x_n) \to \|\phi\|_{L^\infty(\mathbb{R}^n)} \text{ a.e. in } \mathbb{R}^n \text{ as } n \to \infty;$$

$$\sup_{x \in \mathbb{R}^n} A_\rho(x; \phi) = \|\phi\|_{L^\infty(\mathbb{R}^n)}.$$

3 Main results

In this section, we shall show an upper bound of the life span of positive solutions of the Cauchy problem for a semilinear heat equation:

$$\left\{ \begin{array}{ll}
\frac{\partial u}{\partial t} = \Delta u + f(u), & (x, t) \in \mathbb{R}^n \times (0, \infty), \\
 u(x, 0) = \phi(x) \geq 0, & x \in \mathbb{R}^n,
\end{array} \right. \tag{5}$$

where $n \in \mathbb{N}$ and $\phi$ is a bounded continuous function on $\mathbb{R}^n$. We assume that $F(u)$ satisfies

$$f(u) \geq u^p \text{ for } u \geq 0,$$

with $p > 1$.

We prepare several notations. For $\xi' \in S^{n-1}$, and $\delta \in (0, \sqrt{2})$, we set neighborhood $S_{\xi'}(\delta)$:

$$S_{\xi'}(\delta) := \{\eta' \in S^{n-1}; |\eta' - \xi'| < \delta\}.$$

Define

$$M_\infty := \sup_{\xi' \in S^{n-1}, \delta > 0} \left\{ \text{ess.inf}_{x' \in S_{\xi'}(\delta)} \left( \liminf_{r \to +\infty} \phi(rx') \right) \right\}.$$
Theorem 3.1 ([9, 12, 13]). (i) Let \( n \geq 2 \). Assume that \( M_\infty > 0 \). Then the classical solution for (5) blows up in finite time, and the blow up time is estimated as follows:

\[
T_{\text{max}} \leq \frac{1}{p - 1} M_\infty^{1-p}.
\]

(ii) Let \( n = 1 \). Assume that

\[
\max \left\{ \liminf_{x \to -\infty} \phi(x), \liminf_{x \to +\infty} \phi(x) \right\} > 0.
\]

Then the classical solution for (5) blows up in finite time, and the blow up time is estimated as follows:

\[
T_{\text{max}} \leq \frac{1}{p - 1} \left( \max \left\{ \liminf_{x \to -\infty} \phi(x), \liminf_{x \to +\infty} \phi(x) \right\} \right)^{1-p}.
\]

Corollary 3.1. (i) Let \( n \geq 2 \). Suppose that

\[
M_\infty = \|\phi\|_{L^\infty(\mathbb{R^n})}.
\]

Then the solution \( u \) blows up at minimal blow-up time.

(ii) Let \( n = 1 \). Suppose that

\[
\max \left\{ \liminf_{x \to -\infty} \phi(x), \liminf_{x \to +\infty} \phi(x) \right\} = \|\phi\|_{L^\infty(\mathbb{R})}.
\]

Then the solution \( u \) blows up at minimal blow-up time.

Idea of the proof of Theorem 3.1 (i). For \( \xi' \in S^{n-1} \) and \( \delta > 0 \), we first determine the sequences \( \{a_j\} \subset \mathbb{R^n} \) and \( \{R_j\} \subset (0, \infty) \) as follows:

- \( |a_j| \to \infty \) as \( j \to \infty \),
- \( a_j/|a_j| = \xi' \) for any \( j \in \mathbb{N} \),
- \( R_j = (\delta \sqrt{4 - \delta^2}/2)|a_j| \).
For $R_j > 0$, let $\rho_{R_j}$ be the first eigenfunction of $-\Delta$ on $B_{R_j}(0) = \{x \in \mathbb{R}^n; |x| < R_j\}$ with zero Dirichlet boundary condition under the normalization $\int_{B_{R_j}(0)} \rho_{R_j}(x) dx = 1$. Let $\mu_{R_j}$ be the corresponding first eigenvalue. For the solutions for (1), we define

$$w_j(t) := \int_{B_{R_j}(0)} u(x + a_j, t) \rho_{R_j}(x) dx.$$

Now we introduce the following two lemmas for the life span of $w_j$ and for the asymptotics for $w_j(0)$.

**Lemma 3.1** ([12]). The blow up time of $w_j$ is estimated from above as follows:

$$T_{w_j}^* \leq \frac{\log(1 - \mu_{R_j} w_j^{1-p}(0))}{-(p - 1)\mu_{R_j}}$$

for large $j$.

**Lemma 3.2** ([12]). (i) We have

$$\liminf_{j \to +\infty} w_j(0) \geq \text{ess.inf}_{x' \in \Sigma_{\xi}} \phi_{\infty}(x').$$

(ii) We have

$$\lim_{j \to +\infty} \frac{\log(1 - \mu_{R_j} w_j^{1-p}(0))}{-\mu_{R_j} w_j^{1-p}(0)} = 1.$$
