Background of the IUGONET project

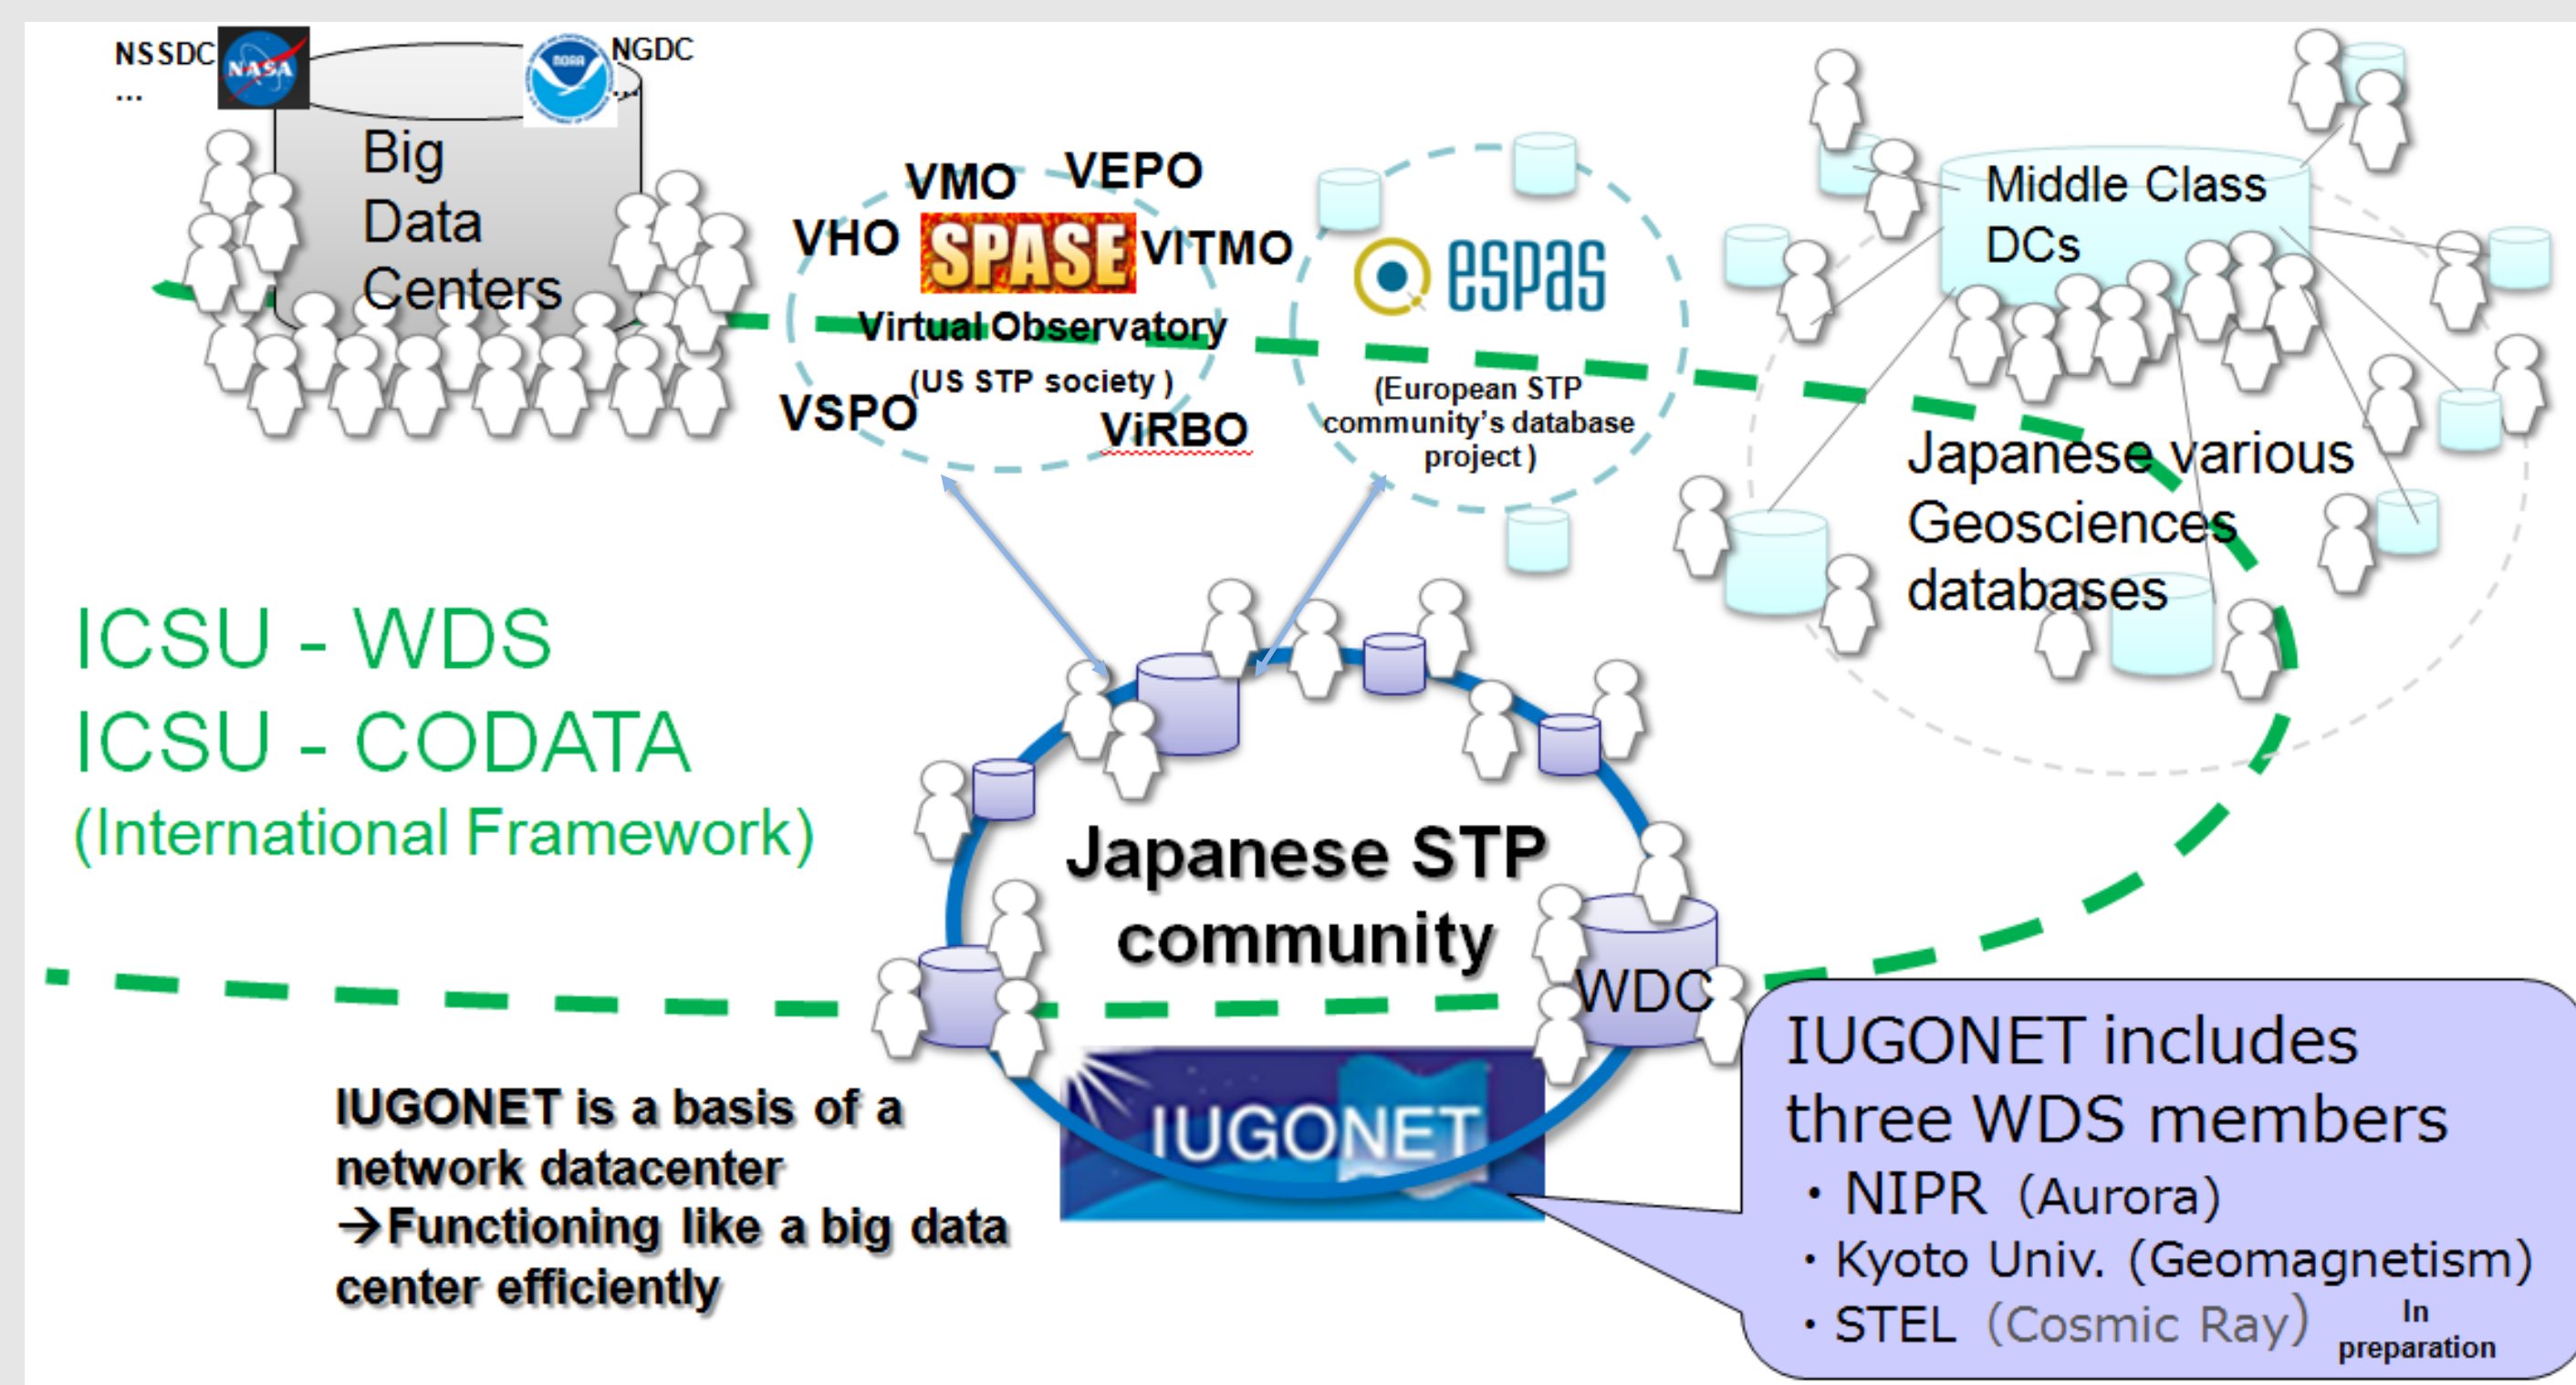

Complicated Upper Atmospheric Phenomena

Characters of the variation in the upper atmosphere

1. Affected by various phenomena from the earth surface to the space
2. Many physical parameters
3. Various waves including that of solar activity are overlapped

International/Interdisciplinary linkage

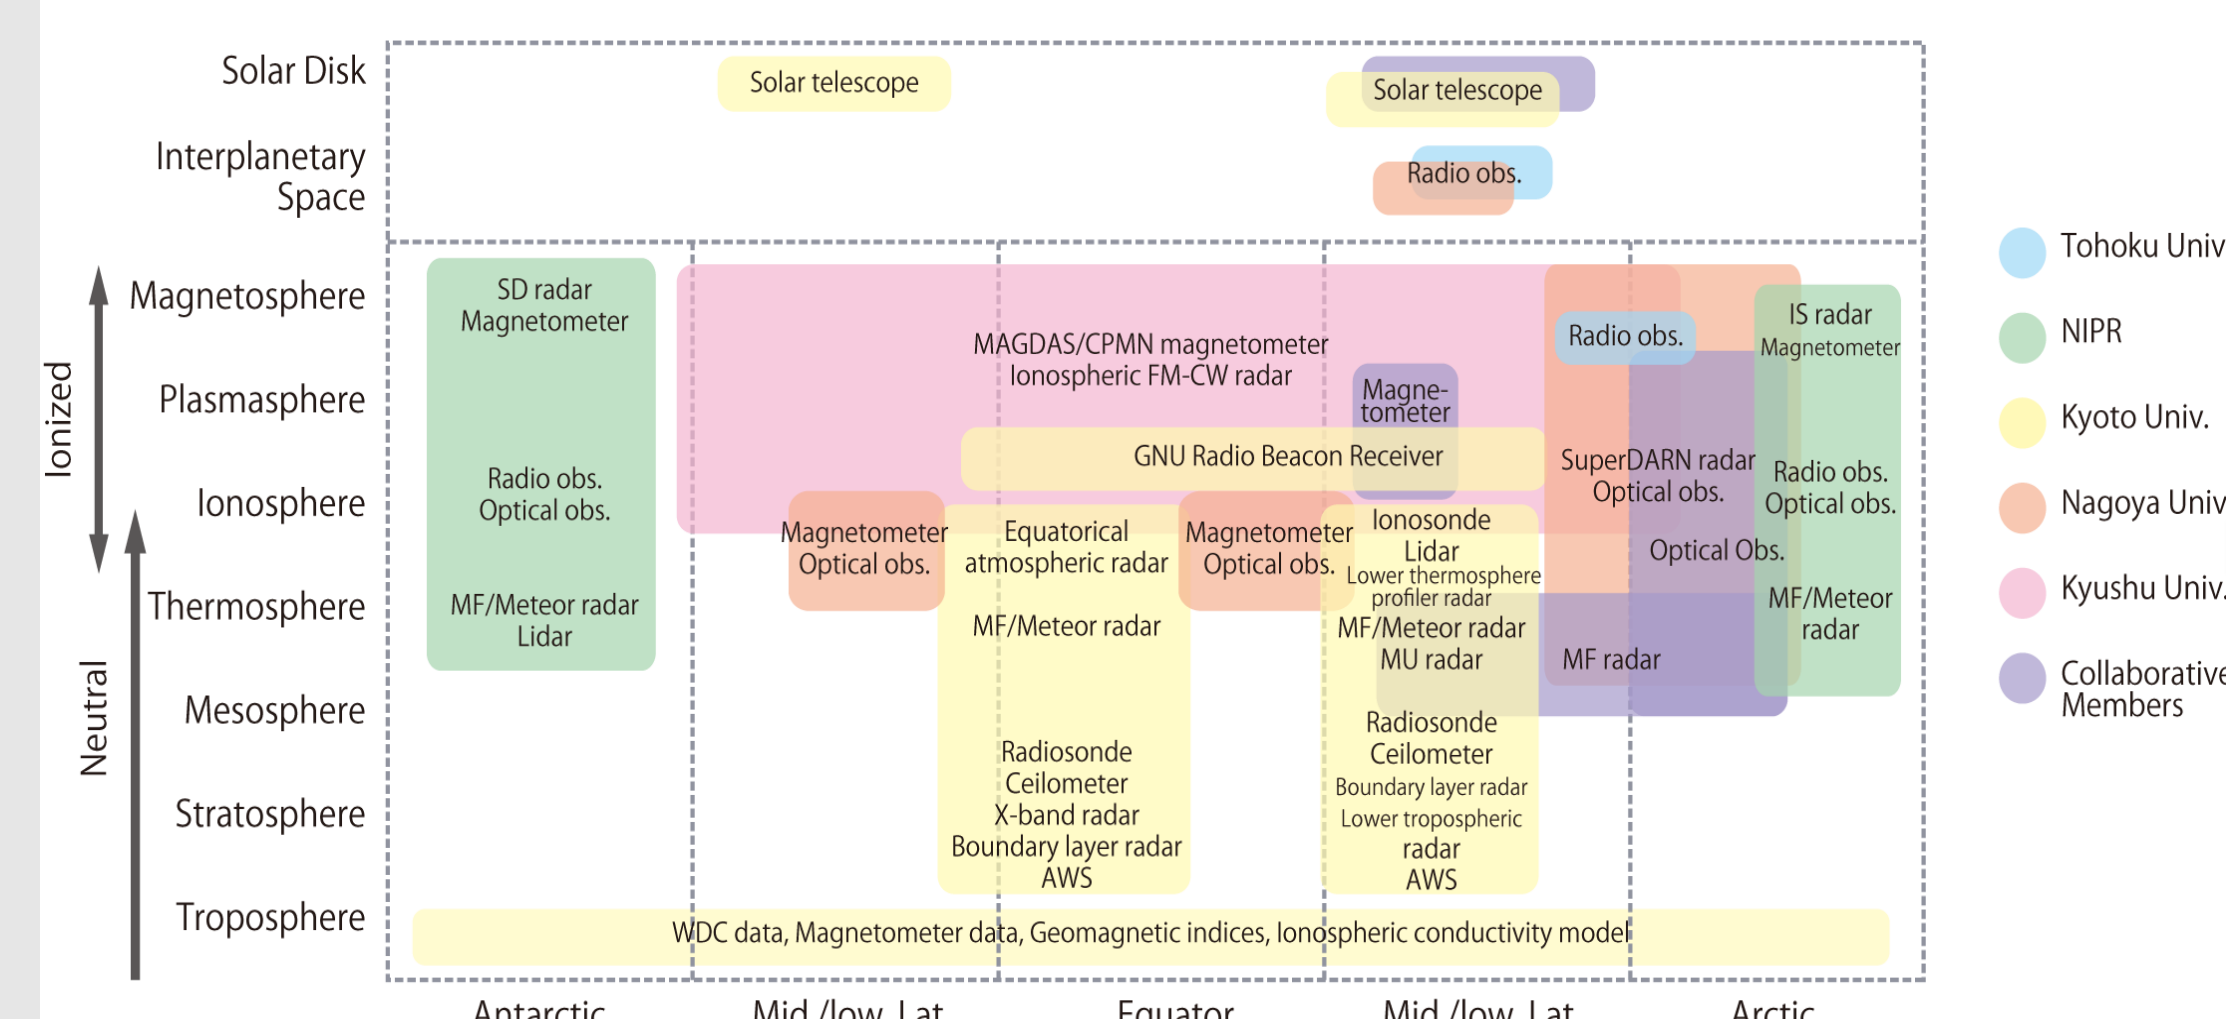

IUGONET Mddb: what's inside?

Number of Registered data (as of 17 May 2013)

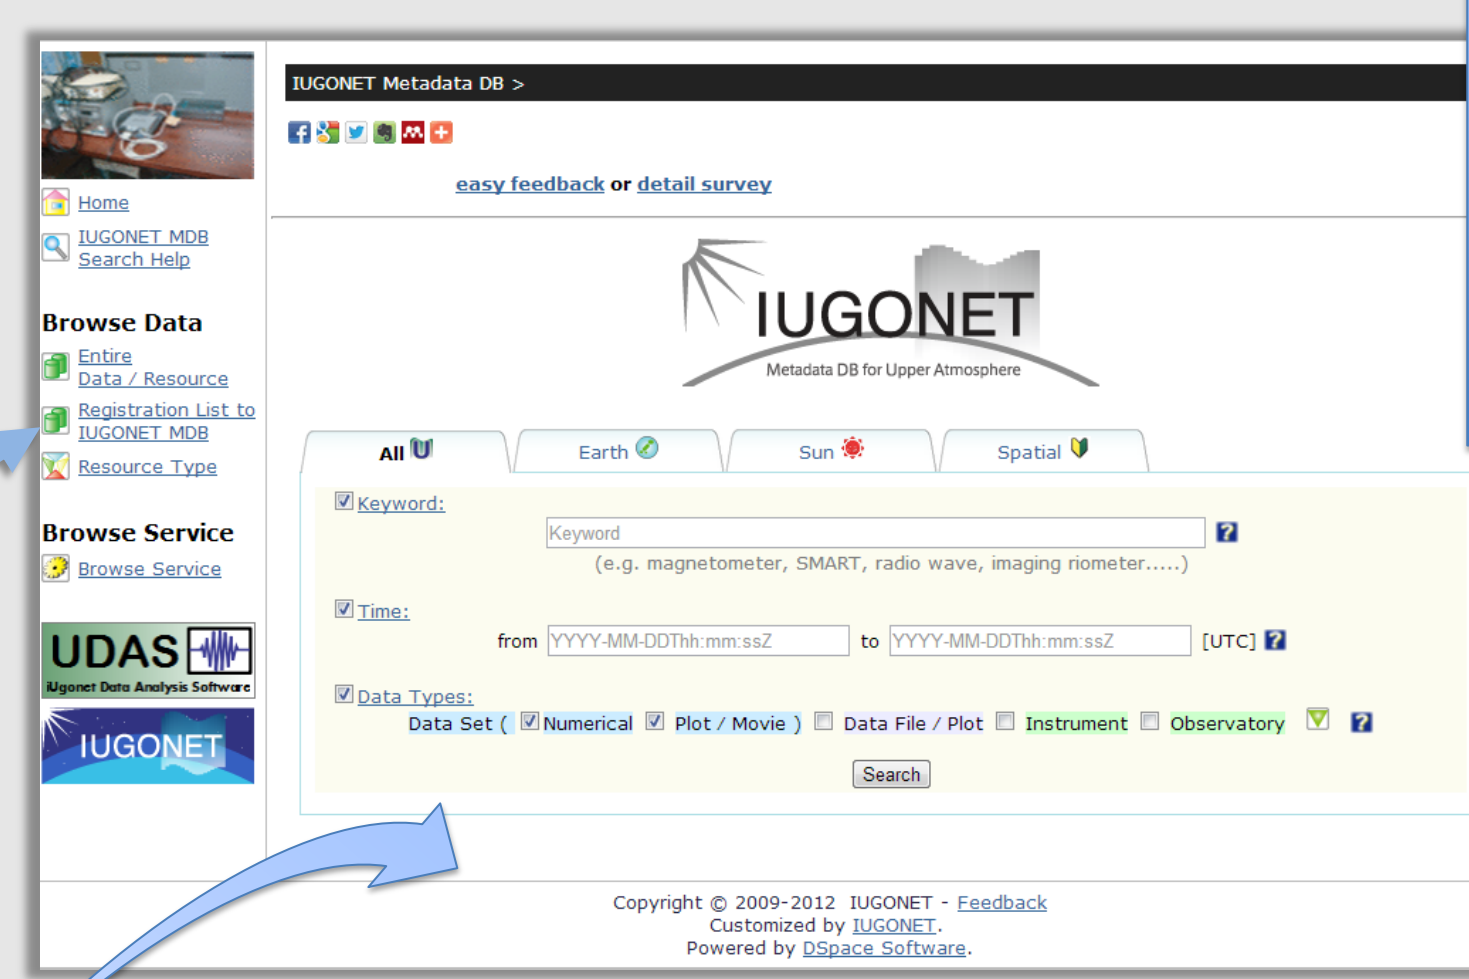

All: 8,394,891
Except for Granule: 2578
(Observatory: 776, Instrument: 869, Dataset 943)

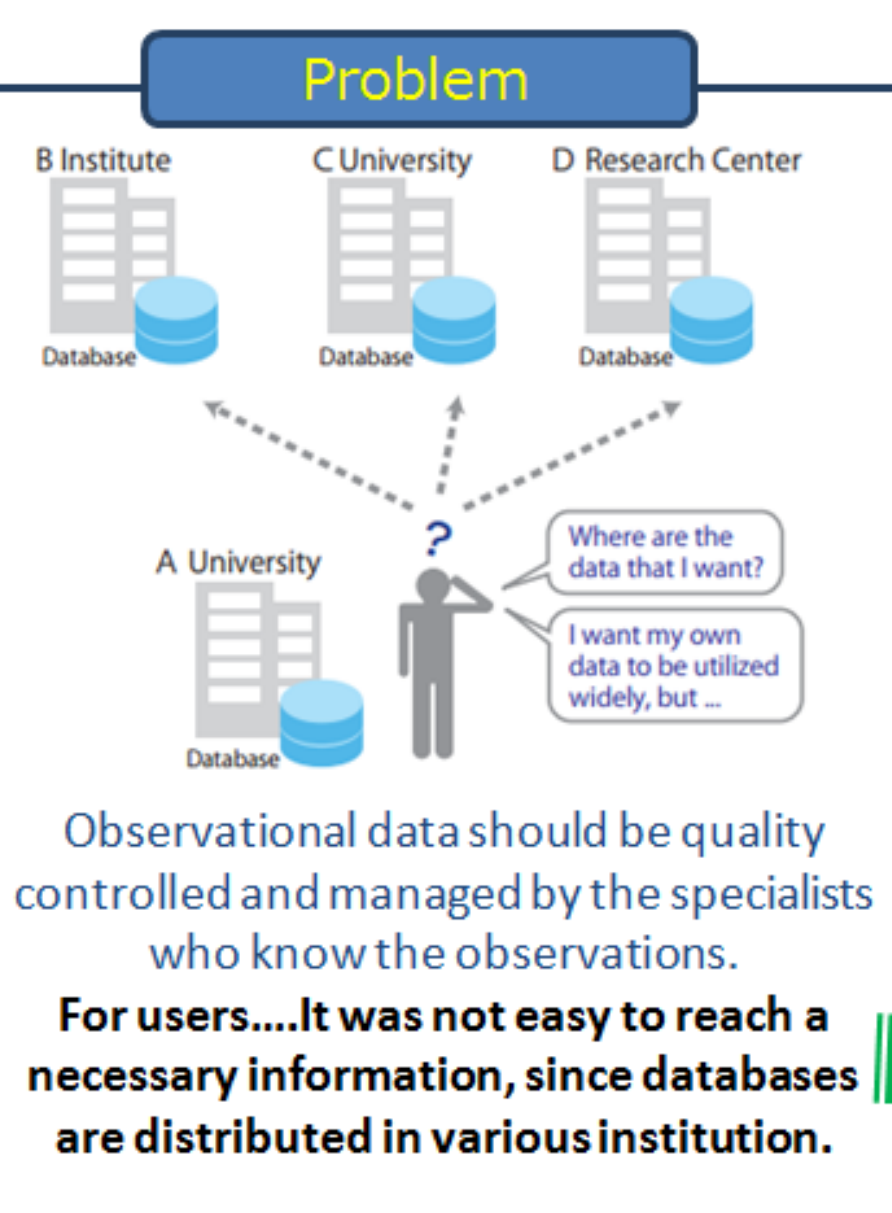

IUGONET Global Network of Ground-Based Observations

Progress of registration to IUGONET Metadata Database

Granule

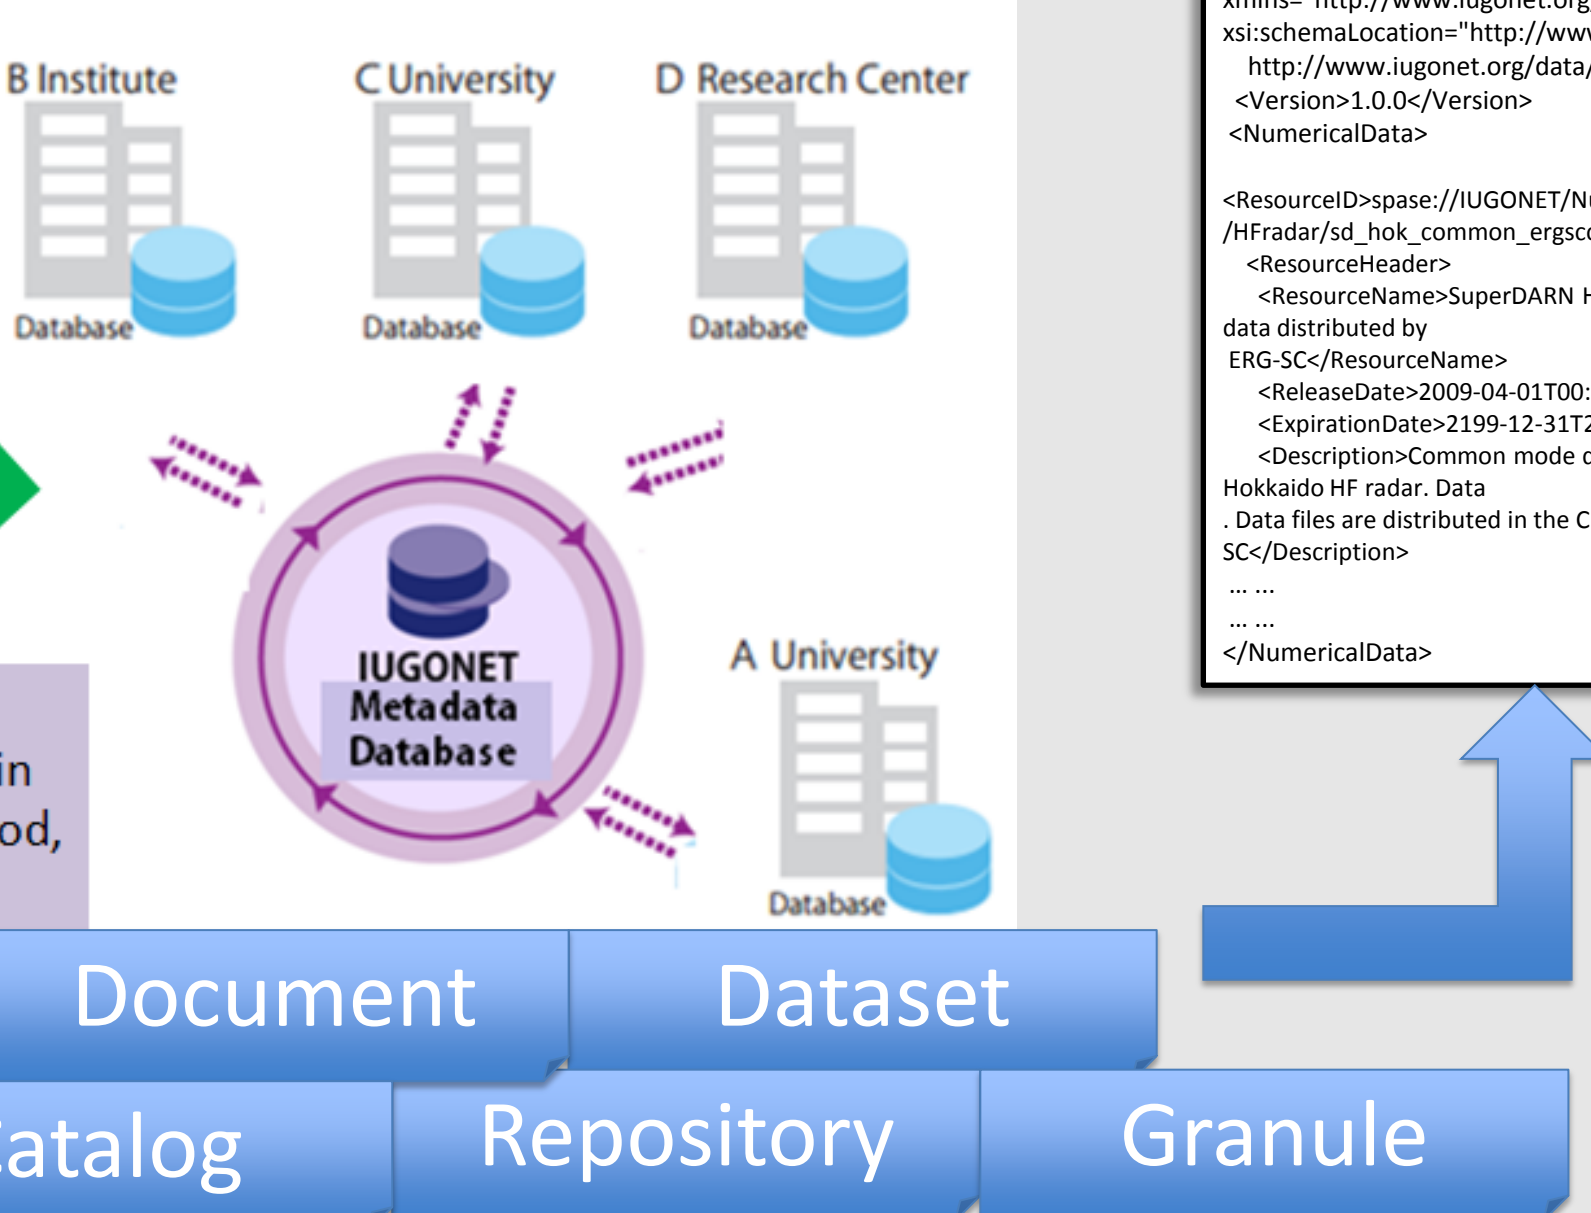

Necessity of a Metadata Database

IUGONET provides a new research platform that enables metadata extracted from ground-based observation data to be shared. In addition, IUGONET developed analysis software to access and analyze data in an integrated fashion.

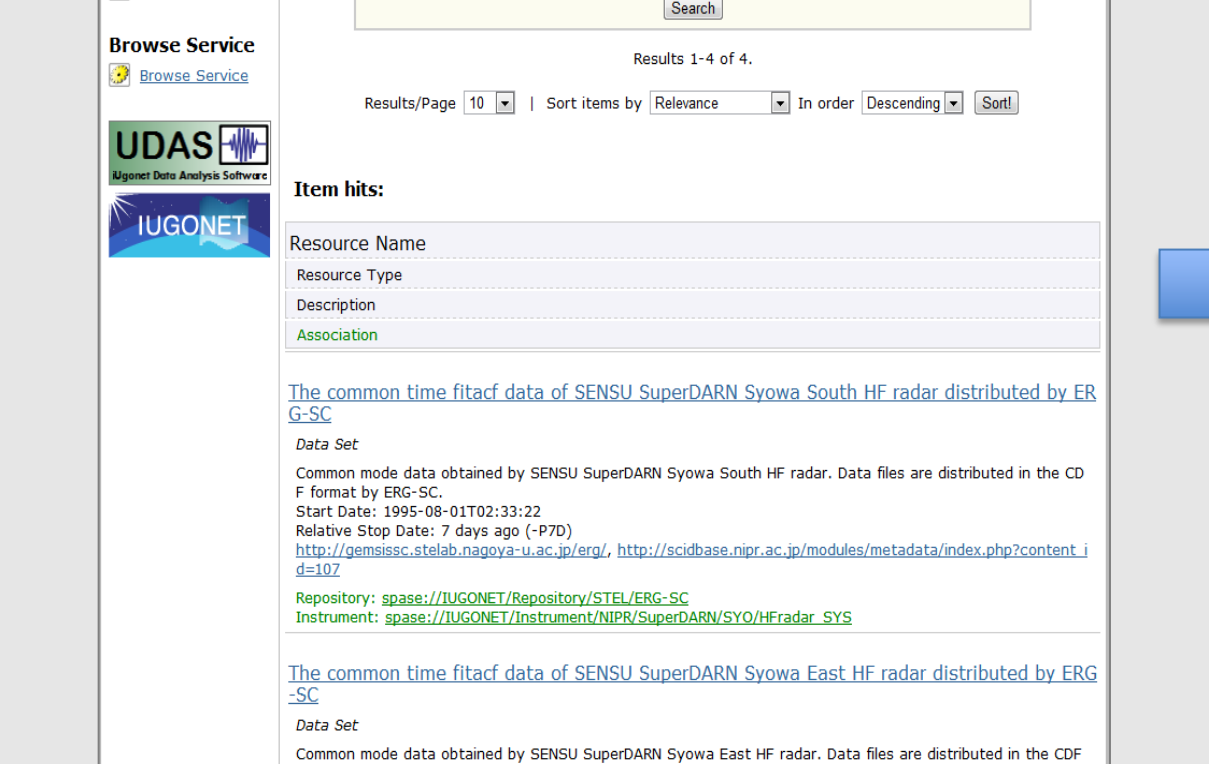

Solution

IUGONET metadata (XML)

```
<?xml version="1.0" encoding="UTF-8"?>
<spase xmlns="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.iugonet.org/data/schema
    http://www.iugonet.org/data/schema/iugonet.xsd"
  version="1.0.0" >
  <Instrument>
    <ResourceName>IUGONET/NumericalData/STEL/SuperDARN/HOK
      /HF radar/rd_hok_common_ergccdf/ResourceId</ResourceName>
    <ResourceType>Common mode data distributed by
      ERG-SC</ResourceType>
    <ReleaseDate>2009-04-01T00:00:00</ReleaseDate>
    <ExpirationDate>2199-12-31T23:59:59</ExpirationDate>
    <Description>Common mode data generated by SuperDARN
      Hokkaido HF radar. Data files are distributed in the CDF
      format from ERG-SC</Description>
    ...
  </Instrument>
</spase>
```

Search Results

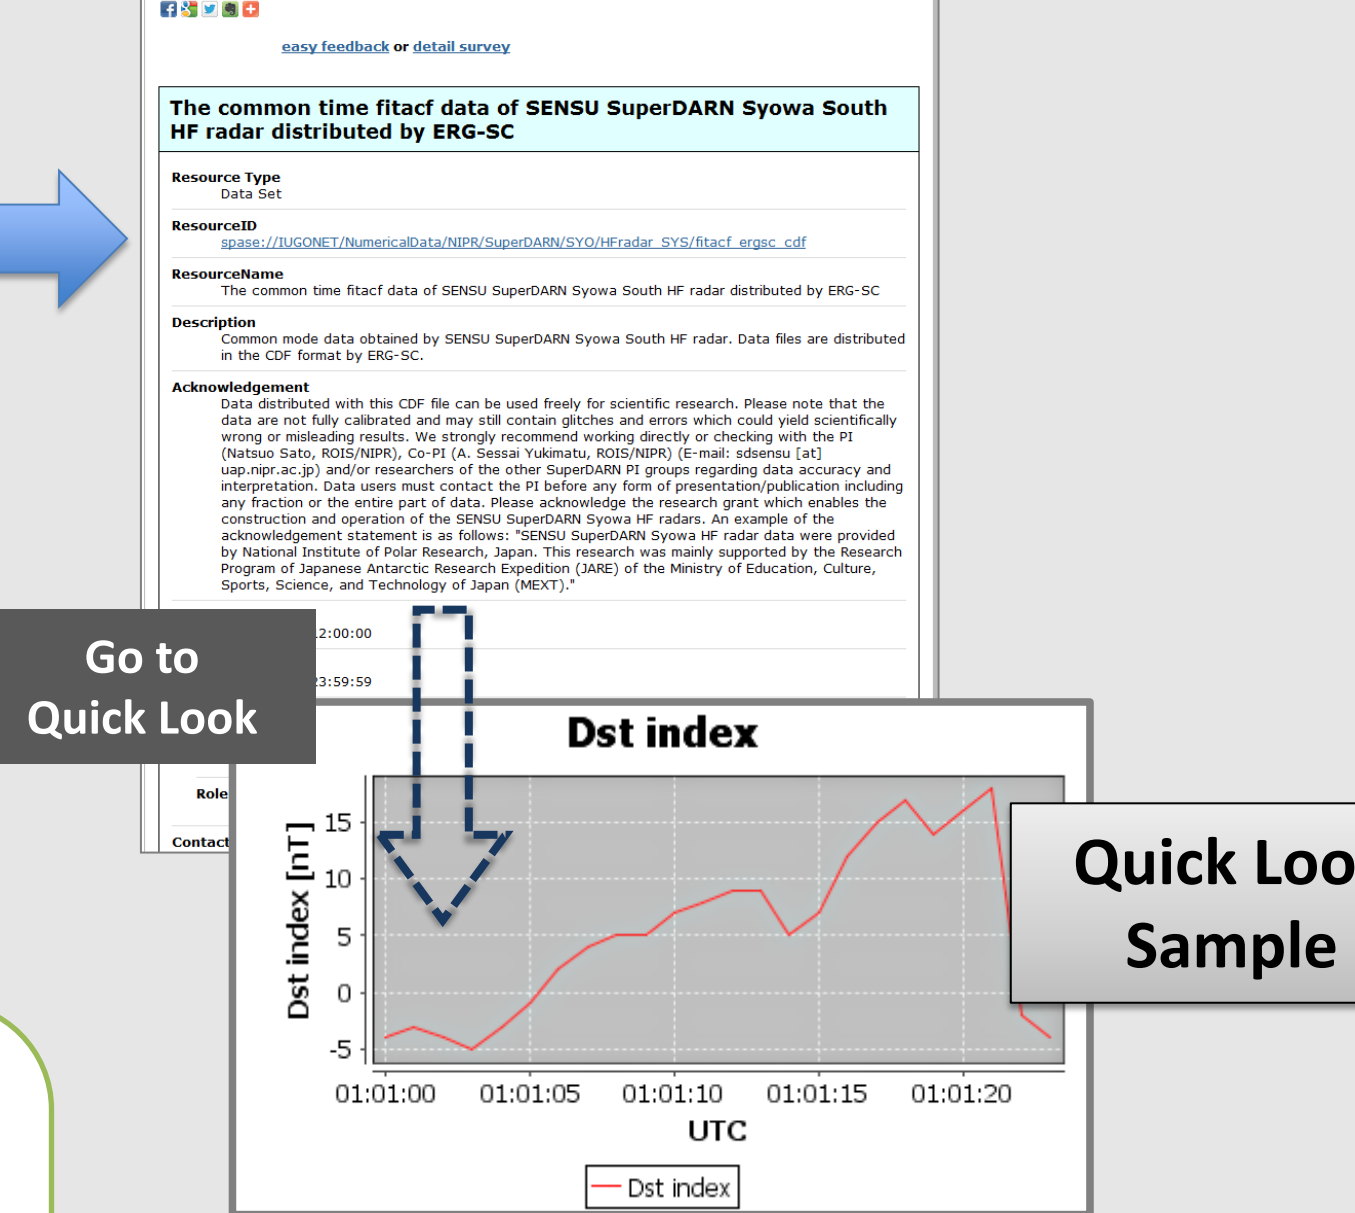

We are preparing a dictionary which works with "Associative Search" developed by NII.

A quick look (QL) viewer of data referred in the Mddb is under development. The viewer with data can be deployed with a single click over the Internet.

- It has not equipped 2D-plot scheme yet.
- We have checked GeoMapApp.

Metadata Details

IUGONET adopted DSpace as the metadata database platform. DSpace is a free software widely used by digital repositories at many universities over the world. One of the major differences between Dublin Core used in the library systems and scientific metadata is the description of domain and period of observation.

Framework of the IUGONET

Further developments and international collaborations

Summary

- The IUGONET project has been developing the infrastructures and common tools (**metadata database (IUGONET-MDB)** and **data analysis software (UDAS)**) to facilitate the distribution and wide use of the ground-based upper atmospheric data provided by the IUGONET university/institutes.
- IUGONET is continuously in discussion with the SPASE Consortium, since the IUGONET common metadata format is based on the SPASE metadata model. IUGONET is currently discussing the possible international collaboration with the databases of the European project "Near earth space data infrastructure for e-science (ESPAS)" and the "Virtual Observatory (VO)" of the United States.
- In Japan, in addition to the metadata provided by the IUGONET institutions/universities, metadata from the National Astronomical Observatory of Japan (NAOJ), National Institute of Information and Communications Technology (NICT), and the Kakioka Magnetic Observatory of the Japan Meteorological Agency (JMA) have been registered.
