Kyoto University
Blow-up and pointwise comparison principles for the generalized Riccati differential equation and application to oscillation of some nonlinear ode’s

Mervan Pašić
University of Zagreb, Faculty of Electrical Engineering and Computing
Department of Mathematics, 10000 Zagreb, Croatia

Abstract We give a short presentation on the blow-up and pointwise comparison principles for the generalized Riccati differential equation recently applied to a study of oscillation of a class of general second-order differential equations with damping term. A part of this review article was presented on the RIMS workshop: Global qualitative theory of ordinary differential equations and its applications, Kyoto 2012. All details have been published in author’s paper [4].

1 Introduction

We consider the following class of the second-order differential equation with damping:

\[(r(t)\Phi(x, x'))' + p(t)\Psi(x, x') + q(t)f(x) = 0, \quad t \geq t_0,\]  
\[(1.1)\]

where we adopt the following:
- solutions: \(x = x(t), \quad x \in C([t_0, \infty), \mathbb{R}) \cap C^2((t_0, \infty), \mathbb{R})\);
- nonlinear or linear functions: \(\Phi = \Phi(u, v), \quad \Psi = \Psi(u, v), \quad f = f(u), \quad \Phi, \Psi : \mathbb{R} \times \mathbb{R} \to \mathbb{R}, \quad f : \mathbb{R} \to \mathbb{R}, \) are smooth enough;
- coefficients: \(r \in C^1([t_0, \infty), (0, \infty)), \quad p, q \in C([t_0, \infty), \mathbb{R})\).

Definition 1.1 A function \(x(t)\) is oscillatory if there is a sequence \(t_n \geq t_0\) such that \(x(t_n) = 0\) and \(t_n \to \infty\) as \(n \to \infty\). A differential equation is oscillatory if all its solutions are oscillatory.

The main assumptions on the differential operators \((r(t)\Phi(x, x'))'\) and the damped term \(p(t)\Psi(x, x')\) are:

\[|u|^{-2}v\Phi(u, v) \geq g(\Phi(u, v)) \quad \text{and} \quad \Psi(u, v)u \geq 0,\]  
\[(1.2)\]

or

\[\Phi(u, v)v \geq 0 \quad \text{and} \quad u|u|^{-2}\Psi(u, v) \geq g(\Phi(u, v))\]  
\[(1.3)\]

where \(\gamma \geq 2\) and \(g : \mathbb{R}_+ \to \mathbb{R}_+:\)

\[\begin{cases}
g(cs) \geq c^\gamma g_0(s) \quad \text{for all } c > 0 \text{ and } s > 0, \\
g_0 : \mathbb{R}_+ \to \mathbb{R}_+ \text{ is a locally Lipschitz function on } \mathbb{R}_+, \\
\exists M_0 > 0 \text{ such that } g_0(s) + M_0 \geq s^2, \forall s \in \mathbb{R}_+.\end{cases}\]  
\[(1.4)\]

For instance, if \(g(s) = g_0(s) = s^\gamma, \gamma \geq 2\), then (1.2) is:

\[|u|^{-2}v\Phi(u, v) \geq (\Phi(u, v))^\gamma \quad \text{and} \quad \Psi(u, v)u \geq 0,\]
Next we give the main examples for the second-order differential operators $(r(t)\Phi(x,x'))'$ that satisfy required assumption (1.2) or (1.3).

**Example 1.1** (linear second-order differential operators in $x'$) We consider the equation:
\[
(r(t)A(x)x')' + p(t)B(x)\psi(x') + q(t)f(x) = 0, \quad t \geq t_0.
\]
Condition (1.2) for $\gamma = 2$ is fulfilled provided functions $A(u)$, $B(u)$ and $\psi(v)$ satisfy:
\[
0 \leq A(u) \leq 1, \quad A(u) \neq 0, \quad uB(u) \geq 0 \quad \text{and} \quad \psi(v) \geq 0.
\]
For instance: $A(u) = |\sin(u)|$ and $A(u) = |u|/(1 + |u|)$. Indeed, for $\Phi(u,v) = A(u)v$, $\Psi(u,v) = B(u)\psi(v)$, $\gamma = 2$ we have:
\[
|u|^{\gamma-2}v\Phi(u,v) = A(u)v^2 \geq A^2(u)v^2 = |\Phi(u,v)|^\gamma.
\]
\[
\Psi(u,v)u = uB(u)\psi(v) \geq 0. \quad \square
\]

**Example 1.2** (quasilinear prescribed mean-curvature differential operators in $x'$) We consider the equation:
\[
(r(t)A(x)\frac{x'}{\sqrt{1+x^2}})' + p(t)B(x)\psi(x') + q(t)f(x) = 0, \quad t \geq t_0.
\]
Condition (1.2) for any $\gamma \geq 2$ is fulfilled provided $A(u)$, $B(u)$ and $\psi(v)$ satisfy:
\[
0 \leq A^{\gamma-1}(u) \leq |u|^{\gamma-2}, \quad A(u) \neq 0, \quad uB(u) \geq 0 \quad \text{and} \quad \psi(v) \geq 0.
\]
For instance: $A(u) = |\sin(u)|$ and $A(u) = |u|/(1 + |u|)$.
Indeed, for $\Phi(u,v) = A(u)\frac{v}{(1+v^2)^{1/2}}$ and $\Psi(u,v) = B(u)|v|^\gamma$,
we have:
\[
|u|^{\gamma-2}v\Phi(u,v) = |u|^{\gamma-2}A(u)\frac{v^2}{(1+v^2)^{1/2}} \geq A^\gamma(u)\frac{v^2}{(1+v^2)^{1/2}} \geq A^\gamma(u)\frac{|v|^\gamma}{(1+v^2)^{\gamma/2}} = |\Phi(u,v)|^\gamma. \quad \square
\]

**Example 1.3** (half-linear second-order differential operators in $x'$) We consider the equation:
\[
(r(t)A(x)|x'|^{\beta-1}x')' + p(t)B(x)|x'|^\beta\gamma + q(t)f(x) = 0, \quad t \geq t_0,
\]
where $\beta \geq 1$. Condition (3) for any $\gamma \geq 2$ is fulfilled provided $A(u)$ and $B(u)$ satisfy:
\[
0 \leq A(u), \quad A(u) \neq 0 \quad \text{and} \quad u|u|^\gamma B(u) \geq A^\gamma(u).
\]
Indeed, for $\Phi(u,v) = A(u)|v|^\beta v$ and $\Psi(u,v) = B(u)|v|^\beta\gamma$, we have:
\[
\Phi(u,v)v = A(u)|v|^{\beta+1}v = A(u)|v|^{\beta+1} \geq 0
\]
and
\[
|u|^{\gamma-1}\Psi(u,v) = |u|^{\gamma-1}B(u)|v|^\beta \gamma \geq A^\gamma(u)|v|^\beta\gamma = |A(u)|v|^\beta v = |A(u)|v|^\beta v = |\Phi(u,v)|^\gamma. \quad \square
\]
2 Riccati transformation under assumption (1.2)

In this section we recall the well known Riccati transformation of the equation (1.1) by supposing the main assumption (1.2).

**Lemma 2.1** Let $p(t) \geq 0$ and $q(t) > 0$. Let $\Phi(u,v)$ and $\Psi(u,v)$ satisfy (1.2), and $f(u)$ satisfy: $f(u)/u \geq K > 0$ for all $u \neq 0$. Let $x(t)$ be a nonoscillatory solution of equation (1.1). Then $\overline{w}(t)$ defined by:

$$\overline{w}(t) = -\frac{r(t)\Phi(x(t),x'(t))}{x(t)}, \quad t \geq T,$$

satisfies the inequality:

$$\overline{w}' \geq (r(t))^{1-\gamma}g_{0}(\overline{w}) + Kq(t) \quad t > T,$$

**Proof.** Taking the first derivative in (2.1), we obtain:

$$\overline{w}'(t) = \frac{r(t)\Phi(x(t),x'(t))}{x^{2}(t)} x'(t) - \frac{(r(t)\Phi(x(t),x'(t)))'}{x(t)}$$

and using equation (1.1) we get:

$$\overline{w}'(t) = \frac{r(t)\Phi(x(t),x'(t))}{x^{2}(t)} x'(t) + \frac{p(t)\Psi(x,x')}{x(t)} + q(t) \frac{f(x(t))}{x(t)}$$

that is:

$$\overline{w}'(t) = \frac{r(t)\Phi(x(t),x'(t))}{x^{2}(t)} x'(t) + \frac{p(t)\Psi(x,x')x(t)}{x^{2}(t)} + q(t) \frac{f(x(t))}{x(t)}.$$

Using assumptions (1.2) and $f(u)/u \geq K > 0$ for all $u \neq 0$, where $\gamma \geq 2$ and $g(s)$ satisfies (1.4), we get:

$$\overline{w}'(t) \geq \frac{r(t)g(|\Phi(x(t),x'(t))|)}{|x(t)|^{\gamma}} + Kq(t) \quad t > T.$$

From (2.1) we get:

$$|\Phi(x(t),x'(t))| = \frac{|\overline{w}(t)||x(t)|}{r(t)}, \quad t \geq T,$$

and putting it into previous inequality we obtain:

$$\overline{w}'(t) \geq \frac{r(t)}{|x(t)|^{\gamma}} g\left(\frac{|\overline{w}(t)||x(t)|}{r(t)}\right) + Kq(t) \quad t > T.$$

Now we can use assumption (1.4) in previous inequality, and hence, we obtain:

$$\overline{w}'(t) \geq \frac{r(t)}{|x(t)|^{\gamma}} \frac{|x(t)|^{\gamma}}{r(t)^{\gamma}} g_{0}(\overline{w}(t)) + Kq(t)$$

$$= (r(t))^{1-\gamma}g_{0}(\overline{w}(t)) + Kq(t) \quad t > T,$$

that proves this lemma. $\square$
3 Riccati transformation under assumption (1.3)

In this section, we repeat the consideration from previous section but supposing the main assumption (1.3) instead of (1.2).

**Lemma 3.1** Let \( p(t) \geq 0 \) and \( q(t) > 0 \). Let \( \Phi(u, v) \) and \( \Psi(u, v) \) satisfy (1.3), and \( f(u) \) satisfy: \( f(u)/u \geq K > 0 \) for all \( u \neq 0 \). Let \( x(t) \) be a nonoscillatory solution of equation (1.1). Then \( \overline{w}(t) \) defined by:

\[
\overline{w}(t) = -\frac{r(t)\Phi(x(t), x'(t))}{x(t)}, \quad t \geq T,
\]

satisfies the inequality:

\[
\overline{w} \geq \frac{p(t)}{r(t)^{\gamma}}g_{0}(|\overline{w}|) + Kq(t), \quad t > T.
\]

**Proof.** We start as before. Taking the first derivative in (2.1), we obtain:

\[
\overline{w}'(t) = \frac{d}{dt}\left[\frac{r(t)\Phi(x(t), x'(t))}{x^{2}(t)}x'(t) - \frac{(r(t)\Phi(x(t), x'(t)))'}{x(t)}\right],
\]

that is,

\[
\overline{w}'(t) = \frac{r(t)\Phi(x(t), x'(t))x'(t)}{|x(t)|^{2}} + \frac{p(t)\Psi(x, x')x(t)|x(t)|^{\gamma-2}}{|x(t)|^{\gamma}} + q(t)\frac{f(x(t))}{x(t)}.
\]

Using assumptions \( f(u)/u \geq K > 0 \) for all \( u \neq 0 \), and (1.3), where \( \gamma \geq 2 \) and \( g(s) \) satisfy (1.4), we get:

\[
\overline{w}'(t) \geq \frac{p(t)g(|\Phi(x(t), x'(t))|)}{|x(t)|^{\gamma}} + Kq(t) \quad \text{for} \quad t > T.
\]

From (2.1) we have in particular that:

\[
|\Phi(x(t), x'(t))| = \frac{||w(t)||x(t)||}{r(t)}, \quad t \geq T,
\]

and putting it into

\[
\overline{w}'(t) \geq \frac{p(t)g(|\Phi(x(t), x'(t))|)}{|x(t)|^{\gamma}} + Kq(t) \quad \text{for} \quad t > T,
\]

we obtain:

\[
\overline{w}'(t) \geq \frac{p(t)}{|x(t)|^{\gamma}}g\left(\frac{||w(t)||x(t)||}{r(t)}\right) + Kq(t) \quad \text{for} \quad t > T.
\]

Now we use assumption (1.4) in previous inequality and so, we conclude that:

\[
\overline{w}'(t) \geq \frac{p(t)}{|x(t)|^{\gamma}}g\left(\frac{||w(t)||x(t)||}{r(t)}\right) + Kq(t)
\]

\[
= \frac{p(t)}{r(t)^{\gamma}}g_{0}(||w(t)||) + Kq(t) \quad \text{for} \quad t > T,
\]

that shows this lemma. \( \square \)
4 A pointwise comparison principle and a blow-up argument

We consider the generalized Riccati differential equation:

\[ w'(t) = a(t)g_0(|w(t)|) + Kq(t), \quad t > T, \tag{4.1} \]

where

\[ a(t) = \begin{cases} (r(t))^{1-\gamma} & \text{under condition (1.2),} \\ p(t)/r(t)^\gamma & \text{under condition (1.3).} \end{cases} \]

For \( T_0 \) and \( T^*, \ T \leq T_0 < T^* \), we associate to equation (4.1) the corresponding sub- and supersolutions: \( \underline{w}, \overline{w} \in C^1([T_0, T^*), \mathbb{R}) \) defined respectively by:

\[ \underline{w}'(t) \leq a(t)g_0(|\underline{w}(t)|) + Kq(t) \quad \text{and} \quad \overline{w}'(t) \geq a(t)g_0(|\overline{w}(t)|) + Kq(t) \quad \text{in} \quad [T_0, T^*). \]

**Definition 4.1** We says that the comparison principle holds for equation (4.1) with arbitrary \( T_0 \) and \( T^* \), \( T \leq T_0 < T^* \), if the following statement holds for all sub- and supersolutions \( \underline{w}, \overline{w} \) of equation (4.1):

\[ \underline{w}(T_0) \leq \overline{w}(T_0) \quad \text{implies} \quad \underline{w}(t) \leq \overline{w}(t) \quad \text{for all} \quad t \in [T_0, T^*). \]

For a supersolution \( \overline{w} \in C^1([T_0, \infty), \mathbb{R}) \) of the Riccati differential equation (4.1), let find:
- two real numbers \( T_0 \) and \( T^* \), \( T \leq T_0 < T^* \),
- a subsolution \( \underline{w} \in C^1([T_0, T^*), \mathbb{R}) \) of equation (4.1),

such that the following initial and blow-up arguments are satisfied at the same time:

\[ \underline{w}(T_0) \leq \overline{w}(T_0) \quad \text{and} \quad \lim_{t \to T^*} \underline{w}(t) = \infty. \]

By a combination of the preceding comparison principle and the initial and blow-up arguments we can conclude:

\[ \lim_{t \to T^*} \underline{w}(t) \leq \lim_{t \to T^*} \overline{w}(t), \]

and hence, every supersolution \( \overline{w}(t) \) satisfies:

\[ \lim_{t \to T^*} \overline{w}(t) = \infty. \]

It shows the nonexistence of a global supersolution of the Riccati differential equation (4.1).

In conclusion:

1\textsuperscript{st} step: if there is a nonoscillatory solution \( x(t) \) of the main equation (1.1):

\[ (r(t)\Phi(x, x'))' + p(t)\Psi(x, x') + q(t)f(x) = 0, \quad t \geq t_0, \]

then the function \( \overline{w}(t) \) defined by:

\[ \overline{w}(t) = -\frac{r(t)\Phi(x(t), x'(t))}{x(t)}, \quad t \geq T, \]

is a GLOBAL supersolution of the Riccati differential equation (4.1);

2\textsuperscript{nd} and 3\textsuperscript{rd} steps: for some sufficient "oscillation" conditions, the comparison and blow-up principles for equation (4.1) hold and it implies: \( \lim_{t \to T^*} \overline{w}(t) = \infty \), that is, \( \overline{w}(t) \) is a LOCAL supersolution of (4.1), which implies that there is NO any nonoscillatory solution of the main equation (1.1). By this contradiction, we can conclude that equation (1.1) is oscillatory.

Now we present the main results of this section.
Lemma 4.1 (a pointwise comparison principle) Let \( a(t) = (r(t))^{1-\gamma} \) in the case of condition (1.2) or \( a(t) = p(t)/r(t) \gamma \) in the case of condition (1.3) and let \( a(t) \) be a locally integrable function on \( \mathbb{R}_+ \). Then for every two points \( T_0 \) and \( T^* \), \( T \leq T_0 < T^* \), and for every sub- and supersolution \( \underline{w}(t), \overline{w}(t) \in C^1([T_0, T^*), \mathbb{R}) \) of the generalized Riccati differential equation (4.1) we have: \( \underline{w}(T_0) \leq \overline{w}(T_0) \) implies \( \underline{w}(t) \leq \overline{w}(t) \) for all \( t \in [T_0, T^*) \). That is:

- \( \underline{w}(t) \leq \overline{w}(T_0) \),
- \( \underline{w}'(t) \leq a(t)g_0(|\underline{w}(t)|) + Kq(t) \), \( t > T \),
- \( \overline{w}(t) \geq a(t)g_0(|\overline{w}(t)|) + Kq(t) \), \( t > T \),

which gives: \( \underline{w}(t) \leq \overline{w}(t) \) for all \( t \in [T_0, T^*) \).

Lemma 4.2 (a blow-up principle) Let the coefficients \( a(t) \) and \( Kq(t) \) of the generalized Riccati differential equation (4.1) satisfy the following "oscillation" condition: there is a continuous function \( C(t) \) and a point \( T_1 \geq t_0 \) such that:

\[
C(t) \leq \min\{a(t), Kq(t)\}, \quad t \geq T_1 \quad \text{and} \quad \limsup_{t \to \infty} \int_T^t C(\tau) d\tau = \infty. \tag{4.2}
\]

Then there are two points \( T_0 \) and \( T^* \), \( T_0 < T^* \), and a subsolution \( \underline{w}(t) \) of equation (4.1) such that:

\[
\underline{w}(T_0) \leq \overline{w}(T_0) \quad \text{and} \quad \lim_{t \to T_0^-} \underline{w}(t) = \infty.
\]

5 Main results and examples

In this section we present the main results and their consequences. Also, a few examples are given to illustrate the importance of our main results.

Theorem 5.1 Let \( \Phi(u, v) \) and \( \Psi(u, v) \) satisfy condition (1.2) or (1.3). Let \( f(u)/u \geq K > 0 \) for \( u \neq 0 \), and let coefficients \( r(t) \) and \( q(t) \) satisfy "oscillatory condition" (4.2). Then equation (1.1) is oscillatory.

The main consequence is the following.

Corollary 5.1 Let \( \Phi(u, v) \) and \( \Psi(u, v) \) satisfy condition (1.2) or (1.3), and let \( f(u)/u \geq K > 0 \) for \( u \neq 0 \). Let \( \mu \leq 1/(\gamma - 1) \) or \( \nu \geq \gamma \mu - 1 \) and \( \sigma \leq 1 \), where \( \gamma \geq 2 \) Then equation:

\[
(t^{\nu}\Phi(x, x'))' + t^{\nu}\Psi(x, x') + t^{-\sigma}f(x) = 0, \quad t \geq t_0, \tag{5.1}
\]

is oscillatory.

Proof. The hypotheses on \( \Phi(u, v) \), \( \Psi(u, v) \), and \( f(u) \) are the same as in Theorem 5.1. Hence, we need only to show that the coefficients:

\[
r(t) = t^{\mu}, \quad p(t) = t^{\nu} \quad \text{and} \quad q(t) = t^{-\sigma}, \quad t \geq t_0,
\]

where \( \mu \leq 1/(\gamma - 1) \) or \( \nu \geq \gamma \mu - 1 \) and \( \sigma \leq 1 \), satisfy the required oscillatory condition (4.2). Indeed, in both cases (1.2) and (1.3), if \( C(t) = c/t \) for some \( c > 0 \) and all \( t \geq t_0 > 0 \), then:

\[
\frac{c}{t} \leq \left(\frac{1}{t}\right)^{\mu/(\gamma - 1)}, \quad \frac{c}{t} \leq \left(\frac{1}{t}\right)^{\nu/(\gamma - 1)} \quad \text{and} \quad \frac{c}{t} \leq \left(\frac{1}{t}\right)^{\sigma},
\]

and

\[
\limsup_{t \to \infty} \int_T^t C(\tau) d\tau = \lim_{t \to \infty} \int_T^t \frac{c}{\tau} d\tau = \infty,
\]

which proves this corollary. \( \square \)

Finally, we present some concrete examples which can be shown by previous corollary.
Example 5.1 Let $K > 0$, $\mu \leq 1$ or $\nu \geq 2\mu - 1$ and $\sigma \leq 1$. Then the equation:

$$\left(t^{\mu}\frac{x^{2}}{1+x^{2}}x'\right)' + t^{\nu}x^{3}x'^{2} + Kt^{-\sigma}x = 0, \quad t \geq t_{0} > 0,$$

is oscillatory.

Example 5.2 Let $K > 0$, $\mu \leq 1$ or $\nu \geq 2\mu - 1$ and $\sigma \leq 1$. Then the equation:

$$(t^{\mu}(\sin x)^{2}x')' + t^{\nu}x^{3}x'^{2} + Kt^{-\sigma}x = 0, \quad t \geq t_{0} > 0,$$

is oscillatory.

Example 5.3 Let $\alpha \geq 1$, $n \in \mathbb{N}$, $K > 0$, $\mu \leq 1$ or $\nu \geq 2\mu - 1$ and $\sigma \leq 1$. Then the equation:

$$\left(t^{\mu}\frac{x^{2}}{1+x^{2}}(1+x^{2})^{2n}\right)' + t^{\nu}x\left(\frac{xx'}{(1+x^{2})(1+x^{2})^{2n}}\right)^{2n} + Kt^{-\sigma}x = 0,$$

is oscillatory.

Example 5.4 Let $\beta \geq 1$, $K > 0$, $\nu \geq 2\mu - 1$ and $\sigma \leq 1$. Then the equation:

$$(t^{\mu}(\sin x)^{2}x^{\beta})' + t^{\nu}x^{3}x'^{2\beta} + Kt^{-\sigma}x = 0, \quad t \geq t_{0} > 0,$$

is oscillatory.

Example 5.5 Let $K > 0$, $\mu \leq 1$, $\nu \geq 0$, $\lambda \geq 0$, and $\sigma \leq 1$. Then the equation:

$$\left(t^{\mu}\frac{x^{2}}{1+x^{2}}x'\right)' + t^{\nu}|x|^{\lambda}x^{(x')} + Kt^{-\sigma}x = 0, \quad t \geq t_{0} > 0,$$

is oscillatory.

The oscillation criterion presented in Theorem 5.1 can be called the Fite-Wintner-Leighton type criterion. The reason for that can be found in papers by Fite [1], Wintner [2], Leighton [3], and Pasic [4].
