Abstract

Hepatic stellate cells (HSCs) constitute the liver sinusoid with Kupffer cells (KCs) and liver sinusoidal endothelial cells (LSECs). While the sinusoid functions as the gateway to liver inflammation, whether HSCs contribute to liver inflammation and, if so, how they exert such functions remain elusive. Here we found that mouse as well as human HSCs expressed DP1 receptor for prostaglandin D_2 (PGD_2) selectively in the liver. Pharmacological stimulation of DP1 by BW245C, a DP1-selective agonist, suppressed the activation of cultured HSCs by tumor necrosis factor (TNF)-α at least in part through down regulation of nuclear factor kappa-light-chain-enhancer of activated B cells (NF-κB) signaling and inhibition of c-jun N-terminal kinase (JNK) phosphorylation. DP1 deficiency or BW245C administration in mice significantly enhanced or suppressed concanavalin A (ConA)-induced hepatitis, respectively. ConA injection induced TNF-α and interferon (IFN)-γ expression in the sinusoid, which was suppressed by administration of BW245C. Co-culture of spleen cells and liver non-parenchymal cells showed that ConA first activated spleen cells and this activation led to activation of non-parenchymal cells to secondarily produce TNF-α and IFN-γ. Microarray analysis revealed ConA-induced expression of endothelin-1 (ET-1), tissue factor (TF), and chemokines in the liver and inducible nitric oxide synthase (iNOS) in

hepatocytes, resulting in flow stagnation, leukocyte adherence and migration to the parenchyma, and hepatocyte death. DP1 stimulation inhibits all these events in the liver. Therefore, HSCs mediate amplification of ConA-induced liver inflammation in the sinusoid and causes direct and indirect hepatocyte injury, and DP1 stimulation inhibits this HSC activation. *Conclusions:* HSCs integrate cytokine-mediated inflammatory responses in the sinusoids and relay them to the liver parenchyma, and these HSC actions are inhibited by DP1 stimulation.

Liver sinusoids serve as the gate of inflammation in the liver (1, 2). There, KCs, LSECs, and HSCs, are strategically positioned. KCs and LSECs facing the sinusoidal lumen and in direct contact with the portal circulation constitute the frontline responding to immune and inflammatory challenges (1, 2). In septic liver injury and fatty liver diseases, gut microbiota and their products invade into the portal circulation through the impaired intestinal barrier, and KCs and LSECs respond to them by producing inflammatory cytokines (3). On the other hand, HSCs are located in the space of Disse between LSECs and hepatocytes (1, 2). While the involvement of HSCs in liver fibrosis is well recognized and attracts much attention (4), their role in liver inflammation has been little documented. Quite recently, Yoshimoto et al. (5) examined the mechanism underlying obesity-associated hepatocellular carcinoma (HCC) generation and found that HSCs are activated by gut microbiota-derived deoxycholic acid and promote HCC development through inflammatory cytokines. While this study strongly suggests the proinflammatory role of HSCs in liver inflammation, how HSCs function in various inflammatory liver diseases remains to be characterized. Such a study may lead to identification of a new therapeutic target against liver diseases.

Concanavalin A (ConA)-induced hepatitis is a mouse model of T cell-mediated hepatitis

(6). In this model, inflammatory cytokines, TNF-α (7) and IFN-γ (8) in particular, cause massive liver necrosis with dense infiltration of leukocytes (6). Using this model of liver disease, we have examined the role of HSCs in liver inflammation by analyzing actions of PGD_2. PGD_2 is synthesized from the PG endoperoxide PGH_2 by either hematopoietic or lipocalin PGD synthase. Although PGD_2 comprises about the half amount of all prostanoids produced in the liver (9), it has gained little attention in terms of liver immunology. PGD_2's action is mediated by two PGD_2 receptors, DP1 and DP2 (10). Here, we have found that DP1 is expressed in HSCs, and PGD_2 acting on this receptor exerts hepato-protective action in ConA-induced hepatitis by inhibiting NF-κB pathway and JNK phosphorylation in HSCs. By analyzing this action, we have elucidated that HSCs integrate inflammatory responses in the sinusoid to relay them to the liver parenchyma and these actions are inhibited by stimulation of PGD_2-DP1 signaling in HSCs.

Materials and Methods

Animals. C57BL/6NCrSlc mice, 7-12 weeks of age, were obtained from Japan SLC (Japan). DP1 knockout mice are described elsewhere (11). CD45.1-congenic B6 mice were from Jackson Laboratory. They were housed at the Center of Laboratory Animals of Kyoto University on a 12-hour light/dark cycle under specific pathogen-free conditions. Mice ubiquitously expressing enhanced green fluorescent protein (EGFP) (12) were kindly provided by Dr. Masaru Okabe (Genome Information Research Center, Osaka University, Osaka, Japan) and housed at Kitasato University under specific pathogen-free conditions. All experimental procedures were approved by the Committee on Animal Research of Kyoto University Faculty of Medicine and in accordance with the guidelines of Kitasato University School of Medicine.

Patients. Analysis of human liver samples were approved by the Ethics Committee of Osaka City University. A written informed consent was obtained from all of the patients before operations. Samples used were HCC following HCV infection (n = 7), HCC following HBV infection (n = 2), HCC following alcoholic steatohepatitis (n = 1), and benign hemangioma (n = 2). Normal liver tissue was dissected from resected liver specimen and used for quantitative reverse transcription-polymerase chain reaction (QRT-PCR).

Reagents. Reagents and their sources used in this study were ConA, collagenase IV, DNase I, LPS, and Krebs-Ringer buffer (Sigma, St. Louis, MO), CCl_4 and D-galactosamine (Nacalai Tesque, Kyoto, Japan), BW245C (4S-(3-[(3R,S)-3-cyclohexyl-3-hydroxypropyl]-2,5-dioxo)-4-imidazolidineheptanoic acid)(Cayman Chemical, Ann Arbor, MI), BQ-123 (2-[(3*R*,6*R*,9*S*,12*R*,15*S*)-6-(1*H*-indol-3-ylmethyl)-9-(2-methylpropyl)-2,5,8,11,14-pentaoxo-12-propan-2-yl-1,4,7,10,13-pentazabicyclo[13.3.0]octadecan-3-yl]acetic acid), BQ-788 ((2R)-2-[[(2R)-2-amino-3-(1-methoxycarbonylindol-3-yl)propanoyl]-[(2S)-2-[[(2R,6S)-2,6-dimethylpiperidine-1-carbonyl]amino]-4,4-dimethylpentanoyl]amino]hexanoic acid), Rp-8-Br-cAMPs, and Rp-8-CPT-cAMPs (Santa Cruz, Santa Cruz, CA), and clodronate liposome (13) (Dr. Nico van Rooijen, Department of Molecular Cell Biology, Vrije Universiteit, Amsterdam).

Protocol of ConA-induced hepatitis. ConA, dissolved in 200 μl saline, was injected through lateral tail vein at 10 mg/kg except experiments shown in Supporting Fig. 3 in which 20 mg/kg of ConA was used. BW245C, 1.0 mg/kg in 200 μl saline, was given i.p.

15 minutes after ConA injection. Mice were sacrificed at indicated time points for sampling of serum and/or liver. BQ-123 or BQ-788 were dissolved in saline and injected i.p. 30 minutes before ConA injection. For serum collection, blood was drawn from retroorbital vein and incubated for 30 minutes at ambient temperature. It was subsequently centrifuged at 4 °C at 1000 x g for 20 minutes. Serum was stored at -80 °C until use and sent to SRL (Japan) for AST and ALT measurement.

Protocol of lipopolysaccharide-D-galactosamine (LPS/GalN) - and carbon tetrachloride (CCl_4)-mediated liver acute injury. LPS (30 μg/kg) and 400 mg/kg D-galactosamine, dissolved in saline, were simultaneously administered i.p.. For induction of CCl_4-mediated liver injury, CCl_4, dissolved in 200 μl corn oil, was given i.p at 2 ml/kg. In all protocols, BW245C or vehicle was administered i.p. 15 minutes before LPS/GalN or CCl_4 injection.

Additional methods are described in the Supporting Information. Antibodies used for immunostaining and Western blot are listed in Supporting Table 2. Primers for QRT-PCR are shown in Supporting Table 3.

Results

DP1 is expressed in HSCs and suppresses HSC activation by TNF-α.

We first examined the target cells of PGD_2 in the liver by immunofluorescence for DP1, the major PGD receptor. We used the mouse ileum as a positive control, which highly expresses DP1 (11) and indeed is stained strongly by the antibody to DP1 we used (Supporting Fig. 1A). Immunofluorescent staining for DP1 revealed numerous short linear signals in the mouse liver, which exactly overlapped with those for desmin, a HSC marker (Fig. 1A, upper row), but not with F4/80 and CD31, markers for macrophage lineage and endothelial cells, respectively (Supporting Fig. 1B). QRT-PCR analysis of HSCs, KCs, LSECs, and hepatocytes from mouse livers showed DP1 mRNA expression in HSC fraction (Fig. 1A, lower row). DP1 expression did not significantly change with activation markers of HSCs during the course of culture (Data not shown). We then investigated whether DP1 is also expressed in human liver. Staining of serial sections of normal human liver showed almost complete overlapping of vimentin signals with those of DP1 in the consecutive sections, indicating that human HSCs also express DP1 (Fig. 1B). Consistently, QRT-PCR analysis of different specimen of the human liver detected DP1 expression, the level of which is well correlated with that of vimentin expression, a marker of human HSCs, in these samples (Fig. 1B).

We next examined the function of DP1 in HSCs. Given that DP1 is coupled to 3'-5'-cyclic adenosine monophosphate (cAMP) elevation in the cell and cAMP signaling is mostly cytoprotective, we hypothesized that DP1 exerts protective actions in HSCs. To test this hypothesis, we stimulated murine and human HSCs with TNF-α, a critical cytokine in the pathogenesis of liver injury (7, 14), in the presence or absence of a specific DP1 agonist, BW245C (15). The typical morphology and autofluorescence of isolated mouse HSCs are shown in Supporting Fig. 1C. TNF-α induced activation of mouse (Fig. 1C) and human (Fig. 1D, left) HSCs, as evidenced by increased *Tnf/TNF* mRNA expression. BW245C suppressed this expression in a concentration-dependent manner, which was not seen in HSCs isolated from DP1-deficient mice (Fig. 1C). TNF-α also induced expression of *CCL2*, a chemoattractant for monocytes and activated T cells (16) up-regulated in hepatitis (17). BW245C also suppressed this *CCL2* induction and expression of smooth muscle α-actin type 2 (*ACTA2*), a marker for HSC activation, in human HSCs (Fig. 1D, middle and right). Consistent with the cAMP rise upon DP1 stimulation, treatment of HSCs with forskolin also inhibited *Tnf/TNF* and *CCL2* expression in a concentration-dependent manner (Fig. 1E). Moreover, co-administration of protein kinase A (PKA)-specific inhibitors Rp-8-Br-cAMPs and Rp-8-CPT-cAMPs reversed the suppression of *TNF* exerted by BW245C (Fig. 1F).

These results suggest that DP1 stimulation attenuates HSC activation by TNF-α through cAMP-PKA pathway.

DP1 inhibits nuclear accumulation of NF-κB p65 and phosphorylation of JNK.

Since TNF-α-induced *TNF* expression is mediated by canonical NF-κB pathway (18), we examined the effects of DP1 on this process. In the resting state, NF-κB dimers are associated with IκB proteins and retained in the cytosol. Upon activation of canonical NF-κB pathway, IκB proteins are removed from the NF-κB dimers and degraded, thereby causing them to translocate into the nucleus and to induce the expression of inflammatory genes. As a self-inhibitory mechanism, IκBα is reinduced by NF-κB p65 (p65) and sequesters NF-κB dimers out of nuclei (19). Western Blot (Fig. 2A, B) and oligonucleotide-based ELISA from nuclear fractions (Fig. 2C) revealed that TNF-α induced nuclear accumulation of p65 in primary human HSCs. Although BW245C had no significant effect on nuclear translocation of p65 and IκBα degradation at earlier time points (Supporting Fig. 2), BW245C-treatment attenuated p65 accumulation at 1 hour of stimulation. Concurrently, cytosolic IκBα protein (Fig. 2A, B) and *NFKBIA* mRNA (Fig. 2D) were elevated in BW245C-treated cells compared with vehicle-treated cells. Consistently, co-treatment with cycloheximide

abolished the inhibitory effect of BW245C (Fig. 2E), suggesting the requirement of *de novo* protein synthesis for its suppressive effect. TNF-α -mediated *Tnf/TNF* mRNA expression is also mediated by the activation of MAP kinase pathway, JNK and p38 pathways in particular (20). Therefore we next investigated whether BW245C also inhibits these pathways and found that BW245C suppresses the phosphorylation of JNK but not that of p38 (Fig. 2F). These data suggest that DP1 signaling suppresses the TNF-α actions by (1) facilitating the reinduction of IκBα and thereby sequestering nuclear p65 protein out into the cytosol, and (2) suppressing JNK phosphorylation.

ConA-induced hepatitis is exacerbated in DP1knockout (KO) mice.

Having detected the presence of DP1 in HSCs and the suppression of HSC activation by BW245C *in vitro*, we next evaluated the *in vivo* role of DP1 in HSCs in liver inflammation by subjecting DP1 KO mice to ConA-induced hepatitis. We found that DP1 KO mice exhibited significant exacerbation of hepatitis compared with wild-type (WT) controls as examined by the serum levels of AST and ALT (Fig. 3A). Hematoxylin and eosin (H&E) staining and terminal deoxynucleotidyl transferase dUTP nick end labeling (TUNEL) staining (Fig. 3B) of the liver 24 hours after ConA injection showed massive hepatocyte death in DP1 KO mice compared with WT controls with

significantly larger affected region in DP1 KO mice (Fig. 3B, right). We then injected ConA intravenously (i.v.) into mice deficient in other prostanoid receptors (*i.e.* EP1, EP2, EP3, FP, TP, IP) and examined the specificity of DP1 deficiency. We did not use EP4 KO mice owing to their mixed genetic background, but administered WT mice an EP4 antagonist. Measurement of serum AST and ALT levels revealed that these mice showed no significant difference in liver injury compared to WT mice except for EP3 KO or TP KO, which showed attenuation of hepatitis (Supporting Fig. 3).

A DP1 agonist BW245C suppresses ConA-induced hepatitis.

Since the above results indicate that endogenous PGD_2-DP1 signaling exerts a protective effect on ConA hepatitis, we wondered whether pharmacological stimulation of DP1 further suppresses hepatic inflammation induced by ConA, and tested this hypothesis by BW245C administration. BW245C administered intraperitoneally (i.p.), dose-dependently and significantly suppressed the increase in serum AST and ALT levels and apoptotic areas compared with those in vehicle-treated group (Fig. 3C and D), the effects not seen in DP1 KO mice (Fig. 3C). We next generated bone marrow chimeras and examined the effect of BW245C. We injected clodronate liposomes i.v. before irradiation to eliminate recipient-derived KCs so that KCs are effectively

replaced with donor-derived cells (21). BW245C effectively suppressed ConA-induced hepatitis in WT recipients with DP1 KO bone marrow cells but had no effect in DP1 KO recipients with WT bone marrow cells (Fig. 3E). Consistently, BW245C suppressed serum TNF-α levels only in WT recipients (Supporting Fig. 4), demonstrating that BW245C suppresses hepatitis through DP1 in nonhematopoietic cells in the liver, most probably HSCs.

We next examined localization of hematopoietic PGD synthase (HPGDS) in the mouse liver, which is responsible for biosynthesis of PGD_2 in immune and inflammatory cells (22) and is known to be induced in KCs after LPS treatment. Immunofluorescence study revealed that HPGDS was scarcely detected in untreated liver but clearly seen at 7 hours after ConA injection and its signals overlapped exactly with those for F4/80 (Supporting Fig. 5). These results suggest that the major source of PGD_2 in ConA-induced hepatitis is KCs, and PGD_2-DP1 signaling functions locally in the sinusoid to control ConA-induced hepatitis.

We next performed immunostaining for phosphorylated p65 on serine 536 (pp65), a marker for NF-κB activation (23). Signals of pp65 were induced by ConA both in the

cytoplasm and the nuclei of hepatocytes and were decreased in the presence of BW245C (Fig. 3F, left), which is reflected in the quantification of fluorescence intensity of the nuclei (Fig. 3F, right). These data suggest that DP1 stimulation in the sinusoid suppresses NF-κB activation in hepatocytes caused by ConA administration.

BW245C suppresses intrahepatic production of TNF-α and IFN-γ.

We next examined the effects of BW245C administration on TNF-α and IFN-γ production in ConA-induced hepatitis. Serum TNF-α level peaked at 1 hour after ConA injection and gradually decreased by 24 hours in control mice. BW245C treatment suppressed serum TNF-α concentration at 1 and 3 hours (Fig. 4A). Similar suppression by BW245C treatment was also seen in serum IFN-γ level (Supporting Fig. 6A). Notably, intrahepatic *Tnf* mRNA expression was elevated at 1 hour and partially suppressed by BW245C (Fig. 4A). Consistently, immunostaining showed TNF-α signals in the liver at 1 hour after ConA injection, which co-localized with those of F4/80 and desmin (Fig. 4B) and were almost completely abolished by BW245C treatment (Fig. 4C). To corroborate these findings, we used co-culture of spleen cells and liver nonparenchymal cells (NPCs) (7). ConA addition induced TNF-α production significantly in spleen cells and negligibly in NPCs, when either cultured alone, and

significantly enhanced TNF-α production in co-culture of NPCs and spleen cells. BW245C treatment suppressed this enhancement of TNF-α production in the co-culture system while it has no effect on NPCs or spleen cells alone (Fig. 4D). IFN-γ production was similarly induced and inhibited in the co-culture system (Supporting Fig. 6B). In order to determine the cell population responsible for enhanced production of TNF-α, we performed co-culture experiments using cell culture inserts, with spleen cells in the upper and NPCs in the lower chamber. After stimulation with ConA, total RNA was extracted from each cell population and *Tnf* expression was examined by QRT-PCR. We found that *Tnf* expression was induced in NPCs by co-culture with spleen cells and that this expression was suppressed by BW245C (Fig. 4E). We examined the mechanism of this induction by stimulating spleen cells with Con A for 24 hours and collecting their supernatants (referred to as conditioned medium hereafter). NPCs were then incubated with the conditioned medium in the presence of vehicle or BW245C for 1 hour. *Tnf* mRNA was induced and this induction was inhibited by BW245C to the similar extent as in Fig. 4E (Fig. 4F). These results suggest that BW245C treatment does not inhibit the primary production of TNF-α and IFN-γ by immune cells but suppresses the secondary production of these cytokines by NPCs.

BW245C suppresses the expression of proinflammatory genes induced by ConA in the

liver

In order to gain more mechanistic insights into suppression of the hepatitis by BW245C, we conducted comparative microarray analyses for gene expression. Genes differentially expressed in the liver under each condition are listed in Supporting Table 1. Complete microarray data are deposited in Gene Expression Omnibus with the accession number GSE45413. We discovered 259 genes, expression of which was up-regulated by ConA injection at 3 and 24 hours, and was significantly suppressed by treatment with BW245C (Supporting Fig. 7), and verified differential expression of several of these genes by QRT-PCR (Fig. 5). One of them was *Nos2* that encodes iNOS. iNOS is induced in hepatocytes by TNF-α and IFN-γ and functions critically in ConA-induced hepatitis; deletion of *Nos2* protects mice from ConA-induced hepatitis.(24) Several other TNF-α– or IFN-γ-induced genes showed a pattern similar to that of *Nos2*, being induced by ConA and suppressed by BW245C. These include *Tnfaip6* (tumor necrosis alpha induced protein 6), *Fos* (c-fos), *Sele* (E-selectin), and *Socs3* (Supporting Fig. 7). Among them, there were also the genes related to sinusoidal hemostasis. Expression of ET-1 (*Edn1*) that induces sinusoidal constriction (2), and that of TF (*F3*), a potent initiator of coagulation cascades (25), were up-regulated by ConA and suppressed by BW245C at 3 and 24 hours (Fig. 6A), while expression of endothelin

receptors ET_A (*Ednra*) and ET_B (*Ednrb*) was not affected by either treatment (data not shown). Expression of vascular adhesion molecule 1 (VCAM-1 , *Vcam1*), an adhesion molecule up-regulated by NF-κB activation (26), was induced by ConA and suppressed in the presence of BW245C at 3 hours, but its level returned to basal value at 24 hours. In addition, expression of an array of chemokines, *Ccl2, Ccl7, Ccl11* were up-regulated by the ConA injection and suppressed by the BW245C treatment at 3 hours (Fig. 6B). *Ccl2*, *Ccl7*, and *Ccl11* are located on chromosome 11 in close proximity to each other (27). Finally, we performed immunostaining for iNOS (Fig. 5C), TF (Fig. 5D), VCAM-1 (Fig. 5E), and CCL2 (Fig. 5F). Strong signals appeared for iNOS and CCL2 in the liver parenchyma, for VCAM-1 in the sinusoid, and for TF both in the parenchyma and the sinusoid after ConA stimulation and these signals were almost completely abolished by BW245C treatment. These results demonstrate that DP1 stimulation on HSCs shuts off expression of various genes involved in liver injury.

BW245C improves hepatic microcirculation.

Since microcirculatory deterioration in the liver is caused by vasoconstriction, hypercoagulation, and white blood cell adherence, and results in shutdown of the sinusoidal circulation and parenchymal tissue hypoxia (2) and since we detected

induction of genes involved in sinusoidal homeostasis in the liver after ConA injection and its decrease with BW245C treatment, we investigated sinusoidal blood flow at 4 hours after ConA injection and assessed the effect of BW245C. Intravital fluorescence microscopic analysis revealed obstruction of sinusoids and consequent dilation of the portal venule in the liver of ConA-injected mice, which was markedly rescued by the treatment with BW245C (Supporting Fig. 8A). Quantification showed significant decrease in perfusion area in the liver of ConA-injected, vehicle-treated mice, which was restored by the treatment with BW245C (Supporting Fig. 8B). Furthermore, the analysis using EGFP-labelled leukocytes showed leukocyte accumulation in the sinusoid of the liver of ConA-injected mice as reported previously (28), and this accumulation was significantly attenuated by BW245C treatment (Supporting Fig. 8C, D). Given that HSCs are the only sinusoidal cells expressing DP1, we examined whether BW245C suppresses *EDN1* expression in vitro in HSCs. We found that primary human HSCs express *EDN1* mRNA, which was suppressed by BW245C in a concentration-dependent manner (Supporting Fig. 8E). We next hypothesized that improved sinusoidal blood flow by BW245C is at least in part mediated by decreased ET-1 expression. To test this hypothesis, we administered an ET_A antagonist BQ-123 or an ET_B antagonist BQ-788 i.p. 30 minutes prior to ConA injection and examined their

effects on ConA-induced hepatitis. BQ-123, but not BQ-788, decreased the increase in serum AST and ALT levels in ConA-injected mice (Supporting Fig. 8F). Consistently, H&E staining showed decreased necrotic areas in the liver of BQ-123-adminstered mice compared with that of vehicle-treated animals (Supporting Fig. 8F). Since BW245C was reported to inhibit Ca^{2+} elevation in rat myofibroblasts (29), we examined the possibility that BW245C inhibits ET-1 action by suppressing Ca^{2+} elevation. We used human HSCs and examined the effect of BW245C on ET-1-induced intracellular Ca^{2+} elevation. Preincubation with BW245C had no significant effect on intracellular Ca^{2+} level, suggesting that improved microcirculation is attributed to the decrease in ET-1 (Supporting Fig. 9). These results suggest that production of ET-1 in the inflammatory liver and resultant stagnation of the sinusoidal flow at least in part mediate ConA-induced hepatitis and that DP1 stimulation in HSCs attenuates microcirculatory deterioration by decreasing its ET-1 production.

$CD3^+$ $CD4^+$ cells cluster around blood vessels in the liver of BW245C-treated mice.

We next focused on how BW245C affects the trafficking of inflammatory cells including T cells. We first investigated the degree of cell infiltration by subjecting liver mononuclear cells to flow cytometry at 24 hours. We did not find any significant

difference in the number of $CD3^+$ cells and $Gr\text{-}1^+$ cells between ConA-injected mice treated with vehicle or BW245C (Fig. 6A). We next performed immunostaining to evaluate the distribution of each cell population. $Gr\text{-}1^+$ cell distribution and number did not differ significantly between the two groups (Fig. 6B, C). However, while $CD3^+$ cells infiltrated into the liver parenchyma in ConA injected, vehicle-treated mice, they clustered around the periportal connective tissue adjacent to $CD31^+$ vascular endothelial walls and did not infiltrate into the parenchyma in Con A-injected, BW245C-treated mice (Fig. 6B-D) We noted that the majority of these clustered $CD3^+$ cells was $CD4^+$ T cells (Fig. 6E). These findings suggest that, by treatment with BW245C, ConA-mediated recruitment of $CD3^+$ $CD4^+$ cells to the liver parenchyma is hindered and the cells cluster in the periportal connective tissue.

BW245C suppresses LPS/GalN- but not CCl_4- induced liver injury.

We next examined the effect of BW245C in two other liver injury models; that induced by CCl_4 and that by LPS/GalN. Injection of BW245C before CCl_4 injection had no effect on CCl_4-mediated liver injury (Fig. 7A). On the other hand, BW245C administration before LPS/GalN injection significantly suppressed hepatitis (Fig. 7B). Liver of vehicle-treated mice showed massive intrahepatic hemorrhage and hepatocyte

cell death, while the lesion was minimal in BW245C-treated mice (Fig. 7C). Since LPS/GalN hepatitis is dependent on TNF-α (30), we measured serum TNF-α and intrahepatic *Tnf* mRNA levels and found that BW245C-treated mice had lower serum TNF-α (Fig. 7D) and intrahepatic *Tnf* expression (Fig. 7E) levels compared with those of vehicle-treated mice after LPS/GalN injection. These data suggest that BW245C has no effect on direct hepatocyte injury, but inhibits immune-mediated hepatitis such as ConA-induced hepatitis and LPS/GalN-induced liver injury.

Discussion

In ConA hepatitis, TNF-α and IFN-γ are first produced in response to ConA, reaching their serum peak level within 2 hours (31), and induce expression of pro-inflammatory proteins in both parenchymal and nonparenchymal cells in the liver, causing liver injury occurring at 7 to 8 hours (6). Intriguingly, while BW245C treatment did not inhibit the production of TNF-α and IFN-γ by spleen cells and lowered the plasma level of these cytokines only partially, it suppressed the TNF-α and IFN-γ production in the sinusoid and suppressed expression of TNF-α- and/or IFN-γ-inducible genes in the liver almost completely. These results suggest that there is the relay mechanism of the cytokine production, first in immune cells and then in the sinusoidal cells, and that HSCs function to make such a relay in concert for parenchymal liver injury. Given that KCs, are the main TNF-α-producing cells in the sinusoid (14) and HSCs and not KCs express DP1, HSCs appear to crucially regulate cytokine production by KCs. Such regulatory actions of HSCs may have also operated in the co-culture of spleen cells and NPCs; there, *Tnf* production in NPCs was induced by the conditioned medium from ConA-activated spleen cells, and production of TNF-α and IFN-γ by NPCs was almost completely suppressed by BW245C. Finally, DP1 stimulation in HSCs inhibits $CD3^+$ $CD4^+$ T cell infiltration to the parenchyma. Thus, DP1 stimulation in HSCs appears to

shut off TNF-α production in NPCs in the sinusoid triggered by inflammatory cytokines originating from ConA-activated immune cells, thereby preventing the amplification of liver inflammation. HSCs and KCs can interact either directly or indirectly through fenestrated endothelium (32). The schematic diagram of the mechanism of DP1-mediated inhibition of ConA-induced hepatitis is shown in Fig. 8.

One subcellular mechanism of DP1-mediated preventive actions is likely to be the regulation of NF-κB signaling. BW245C did not interfere with the initial process of this signaling after TNF-α stimulation but promoted the synthesis of IκBα protein through cAMP-PKA signaling and expelled p65 out of nuclei at later time points. This mechanism certainly operates in HSCs, and regulates their functions in the process where DP1 stimulation inhibits ConA-induced hepatitis. A similar enhancement of auto-regulation of NFκB signaling by cAMP was reported in a human pancreatic cancer cell line stimulated with IL-1 and forskolin for 1 hour (33). Another mechanism is the inhibition of JNK phosphorylation. Upon TNF-α stimulation, MAP kinase signaling including JNK pathway induces secondary responses by inducing the expression of inflammatory cytokines including TNF-α itself (20). It is therefore likely that stimulation of other Gs-coupled-receptors on HSCs can exert anti-inflammatory actions

in the liver as we found here in DP1.

DP1 stimulation in HSCs trapped $CD3^+$ cells in the periportal area and inhibits their recruitment into the liver parenchyma. HSCs in the liver are equivalent to pericytes in other tissues due to their location and contractile nature. Pericytes wrap around the endothelium of capillaries and venules (34), serving as a frontline between the circulation and the parenchyma (34). Stark et al. (35) have reported that pericytes lining arterioles and capillaries in the skin navigate neutrophils to the site of inflammation through ICAM-1. However, this alone cannot explain the specificity of its effects on T cells and not neutrophils. Several lines of evidence suggest that VCAM-1 is essential in the $CD4^+$ T cell adhesion on hepatic sinusoidal walls (36, 37). Consistently, VCAM-1 expression in the sinusoid was induced by ConA and suppressed by DP1 stimulation on HSCs. Thus, DP1-mediated suppression of lymphocyte migration from the periportal space to the liver parenchyma could in part be due to decreased VCAM-1 expression by BW245C.

One tissue mechanism for the preventive actions of DP1 simulation of liver injury we found here is improvement of hepatic microcirculation. Alteration in hepatic

microcirculation has been shown in acute liver failure (2). TF, a potent inducer of coagulation pathway (25), is induced by TNF-α and IFN-γ in the liver upon ConA administration, neutralization of which protected mice from intrahepatic fibrin deposition and resultant hepatitis (21). ETs exert strong vasoactive actions through ET_A and ET_B receptors (38). HSCs strongly express ET_A (39), and contract in response to ET-1 during liver injury to narrow the sinusoidal lumen (2). Our study suggests that both sinusoidal constriction through ET-1 and sinusoidal hypercoagulation induced by TF are governed by HSCs and DP1 simulation ameliorates both.

DP1 stimulation suppresses immune-mediated liver injury such as ConA- and LPS/GalN-induced hepatitis, but not CCl_4-induced acute liver injury, although TNF-α is involved in all of the above models (40). Using mice deficient in both TNF receptor 1 and 2, Simeonova et al. showed that TNF-α mediates the induction of proinflammatory substances but not direct hepatocyte injury caused by CCl_4 (40). Our data is consistent with theirs, since BW245C inhibits ConA- and LPS/GalN-induced hepatitis, where TNF-α-dependent gene products play critical roles in liver injury, but not CCl_4-mediated hepatocyte injury, in which TNF-α is synthesized as a result from hepatocyte damage.

In this study, we also examined the effects of PG receptor deficiency other than DP1. PGs have been reported to exert hepato-protective roles. Cyclooxygenase-2 KO mice developed severe hepatitis upon ConA treatment compared with WT controls (41). Our study is consistent with this report, and suggests that PGD_2 is a principal PG mediating such an action. On the other hand, mice deficient in either EP3 or TP exhibited significantly ameliorated ConA-induced hepatitis. Since TP stimulation exacerbates sinusoidal disturbances by platelet activation and promotes leukocyte adhesion in LPS (42)- and TNF-α (43)-mediated liver injury, the phenotype of TP KO mice may be explained by the attenuated sinusoidal stagnation. On the other hand, the mechanism of the protective effect of EP3 deficiency on ConA–induced hepatitis remains to be elucidated.

In conclusion, by examining the effect of a DP1 agonist BW245C, we clarified the critical role of HSCs in liver injury that was scarcely explored before. Our data indicate that HSCs form a triad with KCs and LSECs and integrate actions of this complex at the gateway to liver inflammation. Precise molecular mechanism of this interaction and identification of molecules involved therein remain to be explored. Nonetheless, this

study thus provides an intriguing possibility that HSCs can be exploited as a target for development of a new therapy against various liver diseases.

Figure 1. Exclusive expression of DP1 on HSCs and effect of a DP1 agonist BW245C on TNF-α and CCL2 mRNA expression by HSCs. (A, top) Co-staining of the mouse liver for DP1 and desmin. Shown are representatives of five samples per group. Bars, 50 μm. (A, bottom) Expression of liver cell markers and DP1 mRNA of liver cells isolated from untreated mice. Data show mean ± SD of three independent experiments. (B, top) Immunohistochemistry for vimentin and DP1 in the human liver. Serial sections of apparently normal part of human liver were stained for vimentin (left) or DP1 (right). Red arrows indicate signals for vimentin or DP1. Bars, 50 μm. Shown is a representative of two samples. (B, bottom) Correlation of mRNA expression of vimentin (*VIM*) and DP1 (*PTGDR*) of twelve human liver samples. (C) Effect of BW245C on TNF-α-induced *Tnf* expression in HSCs from wild-type mice and DP1-deficient (DP1 $^{-/-}$) mice. (D) Effect of BW245C on TNF-α-induced *TNF* (left) and *CCL2* (middle) expression, and effects on *ACTA2* expression (right) in primary human HSCs. (E, F) Effects of forskolin on TNF-α-induced *Tnf* expression by primary mouse HSCs (E) and *TNF* (F, left) and *CCL2* (F, middle) expression by human HSCs. Cells were treated with or without TNF-α in the presence of various concentrations of BW245C or forskolin for 1 hour except for *ACTA2* expression in (D), in which human

HSCs were treated with BW245C for 6 hours. (F, right) Effect of PKA inhibitors on suppression of *TNF* expression. Data are mean ± standard deviation (SD) of duplicate or triplicate wells and are representatives of at least two independent experiments. **, $P < 0.01$ and *, $P < 0.05$, compared with TNF-α and vehicle-treated group.

Figure 2. DP1 facilitates the resynthesis of IκBα and suppresses nuclear accumulation of p65 induced by TNF-α, and also inhibits JNK phosphorylation. Western blot (A) and densitometric analysis (B) for nuclear p65 and cytoplasmic IκBα proteins of primary human HSCs treated for 1 hour with vehicle or BW245C in the presence or absence of TNF-α. V, vehicle and B, BW245C. Lamin B and GAPDH were used as loading controls. Data are representatives of five experiments. (C) ELISA-based quantification of nuclear p65. Data are mean ± SD of five samples from two independent experiments. (D) QRT-PCR analysis of *NFKBIA* (IκBα) expression in primary human HSCs treated for 1 hour with vehicle or BW245C in the presence or absence of TNF-α. (E) Effect of cycloheximide (CHX) on DP1-mediated suppression of *TNF* expression. Cells were stimulated with TNF-α in the presence of vehicle or BW245C for 1 hour after pretreatment with CHX or vehicle. (F) Western blot and densitometric analysis for phosphorylated JNK (pJNK, left) and phosphorylated p38 (pp38, right) of primary

human HSCs treated for 10 minutes with vehicle or BW245C in the presence or absence of TNF-α. V, vehicle and B, BW245C. JNK and p38 were used as loading controls for pJNK and pp38, respectively. Data are representatives of five experiments.

Data are mean ± SD of triplicate wells and are representatives of at least two independent experiments. **, $P < 0.01$ and *, $P < 0.05$, compared with TNF-α and vehicle-stimulated group.

Figure 3. Effect of DP1 deficiency or DP1 stimulation on ConA-induced hepatitis. (A) Serum AST and ALT levels in ConA-induced hepatitis in wild-type and DP1 KO (DP1 $^{-/-}$) mice. Serum was collected from control non-injected mice or from ConA-injected mice 24 hours after the injection. Data are expressed as mean ± SD of six mice. WT, wild-type mice. (B) H&E staining (left and middle) and TUNEL staining (right) of livers collected 24 hours after ConA injection. Bars, 200 μm (H&E) or 100 μm (TUNEL). Data are representative of five mice (ConA-treated groups) or three mice (untreated groups). (B, right) Quantification of liver injury. Affected areas were measured on H&E stained specimen from five to eight livers under x100 magnification. *, $P < 0.05$, compared with ConA-treated wild-type mice. (C) Effects of BW245C treatment on serum AST and ALT levels of ConA-injected wild-type (left) and DP1 $^{-/-}$

(right) mice. ConA, 10 mg/kg, was injected i.v. and BW245C, 0, 0.3, 1.0 mg/kg (0, 1.0 mg/kg for DP1 $^{-/-}$ mice), in saline was injected i.p.15 minutes later, and serum was collected 24 hours later. The results are mean ± SD of at least five mice. Black bars, AST and gray bars, ALT. (D) Effects of BW245C treatment on liver histology (left) and quantification of liver injury (right). Livers were collected 24 hours after ConA injection from mice treated with vehicle or 1.0 mg/kg BW245C, and subjected to H&E staining (top) and TUNEL staining (bottom). Scale bars, 100 μm. Data are a representative of eight mice in each group. Affected areas of the liver from vehicle or BW245C-treated mice was quantified as in Fig. 3 B. Data are expressed as mean ± SD of eight mice. (E) Serum AST (left) and ALT (right) levels of bone marrow chimera mice subjected to ConA injection. Gray bars, without ConA injection. Black and white bars, ConA-injected mice treated with vehicle or BW245C (1.0 mg/kg), respectively. Data are expressed as mean ± SD of two mice (untreated group) or five to ten mice (ConA-treated groups). (F) Phosphorylated p65 immunostaining of the liver from vehicle- or BW245C-treated mice with or without ConA injection (left) and quantification of fluorescence intensity of hepatocyte nuclei (right). Fluorescence intensities of ten nuclei per group were measured using Image J software. The mean value of vehicle-treated group is subtracted from the value of each sample. Liver was

collected 8 hours after ConA administration. Bars, 100 μm (E) and 50 μm (F). pp65, phospho-p65. Data are representatives of two mice per group. *, $P < 0.05$, **, $P < 0.01$, ***, $P < 0.001$, compared with ConA-injected, vehicle-administered mice in each group. NS, non-significant.

Figure 4. Suppression by BW245C of ConA-induced increase in serum TNF-α level and TNF-α.production by sinusoidal cells. (A) Serum TNF-α concentration (top) and intrahepatic *Tnf* mRNA expression at 1 hour (bottom) in mice injected with ConA with or without BW245C treatment. Dotted line, BW245C-treated group and solid line, vehicle-treated group. (B) Production of TNF-α in the liver sinusoid in ConA-injected mice. The liver was collected 1 hour after ConA injection, and stained for TNF-α, F4/80 and desmin. Bars, 20 μm. (C) Suppression by BW245C of ConA-induced TNF-α production in the sinusoid. The liver was collected 1 hour after ConA injection from vehicle- or 1.0 mg/kg BW245C-treated mice, and stained for TNF-α. None, control mice without ConA injection. Results are representative of five mice. Bars, 50 μm. (D) Augmentation of TNF-α production by co-culture of NPCs and spleen cells, and its suppression by BW245C. TNF-α concentration in culture supernatants of NPCs alone (white), NPCs-spleen cell co-culture (gray), or spleen cells alone (black) are shown. (E)

Tnf expression of NPCs and spleen cells after co-culture separated by cell culture inserts. (F) *Tnf* expression of NPCs stimulated for 1 hour with conditioned medium from spleen cells stimulated with ConA for 24 hours. ***, $P < 0.001$,**, $P < 0.01$ and *, $P < 0.05$, compared with BW245C-administered mice (A, top) or compared with ConA-injected, vehicle-treated group (A, bottom, E, and F). Data are expressed as mean ± SD of ten mice (A, top), or mean ± SD of five wells and are representatives of at least two independent experiments (D-F).

Figure 5. (A, B) QRT-PCR analysis of expression of *Nos2, Edn1, F3* and *Vcam1* (A) and chemokines (B). The liver was collected at 3 hours (white bars) and 24 hours (black bars) from ConA-injected mice co-treated with vehicle (veh) or BW245C and from non-injected mice (-) (gray bars). RNA was extracted and used for analysis. Data are expressed as mean ± SD of five mice. *, $P < 0.05$, **, $P < 0.01$, and ***, $P < 0.001$, compared with veh. (C-F) Immunofluorescence staining for iNOS (C), TF (D), VCAM-1 (E), and CCL2 (F) in mouse liver treated with ConA and either BW245C or vehicle for 8 hours. Shown are representatives of five mice per group. Bars, 50 μm (C, D, and F) and 100 μm (E).

Figure 6. Clustering of $CD3^+CD4^+$ cells in the periportal area of the liver of ConA-injected , BW245C-treated mice. (A) Numbers of $CD3^+$ (top) or $Gr\text{-}1^+$ (bottom) cells in mouse livers at 24 hours after Con A injection with or without BW245C treatment. Data are expressed as mean ± SD of three to seven mice. (B) Immunofluorescence staining for CD3 (green) and Gr-1 (red) of livers collected 24 hours after treatment with either vehicle or BW245C alone or after ConA injection with either vehicle or BW245C. (C) The number of $CD3^+$- or $Gr\text{-}1^+$-cells in liver parenchyma. $CD3^+$- or $Gr\text{-}1^+$-cells were counted in 3 fields under x20 magnification of 3 livers per group. The number of these cells within a 100 μm-range from the blood vessel walls was excluded. Data are expressed as mean ± SD of three mice. (D, E) Co-staining for CD3 (red) and CD31 (green, D) or CD4 (green, E) of livers collected from Con A-injected, BW245C-treated mice at 24 hours after Con A-injection. Results are a representative of five mice.

Figure 7. Effects of BW245C on CCl_4 -or LPS/GalN-induced liver injury. (A and B) Serum AST and ALT levels of mice treated with CCl_4 (A) or LPS/GalN (B) and effects of BW245C. Mice were administered CCl_4 or LPS/GalN, and serum was collected at 24 and 6 hours, respectively. BW245C (1 mg/kg) or vehicle (veh) was administered 15

minutes before CCl_4 or LPS/GalN injection. (-), control mice without any treatment. *, $P < 0.05$, compared with vehicle-treated group. (C) H&E staining of the liver collected 6 hours after injection of LPS/GalN and either vehicle or BW245C. Bars, 200 μm. Data are a representative of five to ten mice per group. (D) Serum TNF-α levels at 1 hour of LPS/GalN-injected mice treated with either vehicle or BW245C. Data are expressed as mean ± SD of five mice. *, $P < 0.05$, compared with vehicle-treated group. (E) QRT-PCR analysis of livers from mice treated with LPS/GalN and BW245C or vehicle for 1 hour. *, $P < 0.05$, compared with vehicle-treated group. Data are expressed as mean ± SD of five mice.

Figure 8. Schematic diagram of the hepato-protective effects of BW245C treatment in ConA-induced hepatitis.

HEP-15-0195.R2

Supplemental Methods

Bone marrow transplantation. Bone marrow transplantation was performed essentially as described (1), with modifications. Since only 40~50% of KCs are replaced with donor-derived cells 3 months after BMT (2), KCs of recipient mice were depleted by administering mice 200 μl clodronate liposome the day before the total body irradiation. They were then sublethally irradiated (9.5 Gy) in a single fraction by a ^{137}Cs γ-ray using a Gammacell 40 Exactor (MDS Nordion International Inc., Ottawa, Canada). Bone marrow cells were collected from the femurs and tibias of donors, washed, and passed through a 70 μm-nylon mesh to remove debris. Cells were then washed and resuspended in Dulbecco's PBS at a concentration of 5×10^7 cells/ml. Recipients were injected with 10^7 bone marrow cells via lateral tail vein. After 12 weeks, mice were used for experiments.

Culture of human HSCs. Human HSCs were purchased from Sciencell Research Laboratories (Carlsbad, CA). They were cultured in Stellate Cell Medium supplemented with Stellate Cell Growth Supplement (Sciencell Research Laboratories), 2 % FCS, 100 U/ml penicillin, and 0.1 mg/ml streptomycin. On confluence, the cells were dissociated and plated at $5x10^4$/well in a 24-well plate (Corning, Corning, NY) for QRT-PCR or at

$5x10^5$/well in a 6-well plate (Corning). They were cultured for 24 hours in the above medium and serum-starved for one day. Medium was removed the next day, and the cells were treated with reagents in fresh serum-free medium for the indicated time periods. The cells were then harvested for RNA or protein extraction for QRT-PCR or Western blot, respectively.

Isolation of murine HSCs and other liver cells. Murine HSCs were isolated as described previously (3). In brief, liver was digested by two-step protocol using collagenase D and pronase E (Roche, Mannheim, Germany). The dispersed cells was filtered through a 70 μm-nylon mesh (BD Falcon, Becton Drive, NJ) and centrifuged at 50x *g* for 1 minute to recover NPC-containing supernatants and pelleted hepatocytes. HSCs, KCs, and LSECs were isolated by discontinuous density gradient centrifugation (24-17-11.5-8.4 %) with Optiprep solution (Axis Shield, Dundee, UK) diluted with HBSS (-). HSCs were collected from the interface between HBSS (-) and 8.4% and suspended in DMEM medium (Invitrogen) supplemented with 10% FCS, 100 U/ml penicillin, and 0.1 mg/ml streptomycin, plated at 5×10^5/well in a 24 well-plate (IWAKI, Tokyo, Japan) and cultured for 2 days. They were then serum-starved for 24 hours and medium was changed. Reagents and cytokines were then added and incubated in a CO_2

incubator for the indicated time periods. KCs and LSECs were collected from the interface between 8.4 % and 11.5 % layers and isolated by differential plating.

Isolation of liver NPCs and protocol for co-culture experiments

For the isolation of liver NPCs, liver was perfused with 5 ml of cold PBS (-) and dissected. Then, it was minced with a scalpel in Krebs-Ringer buffer containing 500 U/ml collagenase IV (Sigma), 2 mM $CaCl_2$, 2 mM $MgCl_2$, and 150 U/ml DNase I (Roche), and incubated at 37 °C for 30 minutes. Liver NPC-containing supernatants were collected and pelleted, washed, and resuspended in 12.6% iodixanol (Axis-Shield). HBSS was layered on the top of the cell suspension, which was centrifuged at 2,100 x *g* for 30 minutes at 4 °C. NPCs were collected at the interface, washed and suspended in RPMI1640 medium (Invitrogen, Carlsbad, CA) supplemented with 10% FCS, 100 U/ml penicillin, 0.1 mg/ml streptomycin, and 100 μM indomethacin (Nacalai Tesque, Kyoto, Japan), plated at 1×10^6/well in a 24 well-plate (IWAKI) and cultured overnight. The spleen was isolated and crushed on a 70 μm-cell strainer in the above RPMI1640 medium. The resultant cell suspension was centrifuged and the cell pellet was subjected to hemolysis to remove erythrocytes. Remaining spleen cells were re-suspended in RPMI1640 medium. The spleen cells were cultured either alone or added to the NPC

culture at 1×10^6/well. In some experiments, spleen cells were cultured on a cell culture insert (BD Falcon) with or without NPCs in the lower chamber. ConA, 2 μg/ml, was added and the cells were cultured for 24 hours. BW245C, 10 μM, was added 5 min prior to ConA addition. The culture supernatants were collected for ELISA.

In experiments using the conditioned medium from spleen cells, cells were collected from the spleen and stimulated with 10 μg/ml of ConA for 24 hours. Cells were pelleted and the supernatants (conditioned medium) were stored at -80 °C until use. NPCs were plated at 1×10^6/well in a 24 well-plate and stimulated with the conditioned medium for one hour in the presence or absence of 10 μM BW245C. NPCs were then subjected to QRT-PCR.

Histological analyses. For fluorescent immunostaining, liver samples were embedded in Tissue-Teck (Sakura Finetek, Tokyo, Japan) filled with OCT compound (Sakura Finetek) and snap-frozen in liquid nitrogen. Frozen sections of 5 μm in thickness were prepared. They were then fixed with either cold acetone or 4 % paraformaldehyde and incubated with PBS (-) containing 5 % BSA to block non-specific staining. The sections were incubated for 60 min at room temperature with first antibodies in Can Get Signal

Immunostain (Toyobo, Osaka, Japan), were washed three times in PBS(-), and incubated with secondary antibodies in Can Get Signal Immunostain. The sections were counterstained with Hoechst 33342 (Invitrogen) and mounted in Prolong Gold Antifade (Invitrogen). For HPGDS staining, sections were fixed in cold acetone, stained for HPGDS using TSA Plus Cyanine 3 System (Perkin Elmer, Waltham, MA) according to the manufacturer's instructions, and then stained for F4/80. For desmin staining, sections were first stained for desmin using M.O.M. kit (Vector Laboratories, Burlingame, CA) and signals were detected with Alexa Fluor 594-conjugated streptavidin (Molecular Probes, Carlsbad, CA). Counterstaining for the nuclei was done with DAPI. Stained sections were observed using LSM 710 (Carl Zeiss, Jena, Germany) and images were acquired and processed with ZEN 2010 software (Carl Zeiss). For H&E staining, the liver was fixed in 10% formalin, and embedded in paraffin. Paraffin blocks were sectioned at 7 μm and stained with hematoxylin and eosin. TUNEL staining was performed as follows. Briefly, after deparaffinization and Proteinase K treatment (10 μg/ml for 15 minutes) of paraffin-embedded sections, endogeneous peroxidase activity was blocked with 0.3% H_2O_2 in methyl alcohol for 30 minutes. Sections were washed in PBS (-) and mounted with 5 μl TdT Enzyme (Takara Bio, Japan) and 45 μl Labeling Safe Buffer (Takara Bio) for 1 hour at 37 °C, followed by

washes in PBS (-). HRP-conjugated anti-FITC antibody (Takara Bio) was applied for 30 min at 37 °C. Coloring reaction was carried out with DAB and nuclei were counterstained with hematoxylin. Images were acquired using a BX50 microscope (OLYMPUS, Tokyo, Japan) and affected areas in a section were measured using ImageJ software. For immunohistochemistry of human liver, liver preparation was fixed in 10% formalin, and embedded in paraffin. Paraffin blocks were sectioned at 4 μm and serial sections were used for experiments. After deparaffinization and citrate buffer treatment (pH 6.0, 120 °C for 20 minutes), samples were blocked with Protein Block, Serum-Free (DAKO, Santa Clara, CA). The samples were then incubated overnight at 4 °C with first antibodies diluted in Protein Block, Serum-Free. The samples were washed three times in TBS. Incubation with the secondary antibody and 3,3′-Diaminobenzidine staining were performed using Histofine Simple Stain System (Nichirei Biosciences, Tokyo, Japan) according to the manufacturer's instructions. The sections were counterstained with hematoxylin and mounted in Softmount 550 (Wako, Osaka, Japan).

QRT-PCR. Total RNA was collected from cultured murine and human HSCs using RNeasy Plus Micro Kit and RNeasy Plus Mini Kit (Qiagen, Hilden, Germany), respectively. For extraction of RNA from the liver, frozen liver was cut into pieces, put

into 1 ml Buffer RLT (Qiagen), and homogenized at 3000 rpm for 30 seconds with Polytron PT2100S (KINEMATICA Inc.). Total RNA was obtained from liver samples with RNeasy mini kit (Qiagen). RNA was then reverse-transcribed to cDNA by using the PrimeScript RT reagent kit (Perfect Real Time) (Takara Bio). QRT-PCR was then performed in SYBR Premix Ex Taq (Perfect Real Time) (Takara Bio) using LightCycler 480 (Roche). The expression of mRNA is represented as fold increase ($2^{-\Delta\Delta Ct}$), where $\Delta\Delta Ct$ = [ΔCt (sample)]-[ΔCt (unstimulated sample)], and ΔCt = [Ct (target gene)]-[Ct (18S)].

DNA microarray. Mice were injected with 10 mg/kg ConA and 1.0 mg/kg BW245C or vehicle and livers were sampled 3 and 24 hours later (n = 5). Non-treated livers (n = 5) were also sampled. Liver total RNA was isolated as described above and sent to Takara Bio for further processing of RNA and analysis. Briefly, Cyanine-3 labeled cRNA was prepared from 0.1 μg total RNA using the Low Input Quick Amp Labeling Kit (Agilent Technologies, Santa Clara, CA) according to the manufacturer's instructions, followed by RNeasy column purification (QIAGEN). First, 0.6 μg of Cyanine 3-labelled cRNA was fragmented at 60°C for 30 minutes in a reaction volume of 55 μl according to the manufacturer's instructions. On completion of the fragmentation reaction, 55 μl of 2x

Agilent hybridization buffer was added to the fragmentation mixture and hybridized to Agilent SurePrint G3 Mouse GE 8x60K for 17 hours at 65°C in a rotating Agilent hybridization oven. After hybridization, arrays were washed and dried immediately by brief centrifugation. Slides were then scanned immediately on the Agilent DNA Microarray Scanner (G2565CA) using one color scan setting for 8 x 60k array slides (Scan Area 61x21.6 mm, Scan resolution 3μm, Dye channel is set to Green PMT). The scanned images were analyzed with Feature Extraction Software 10.7.3.1 (Agilent Technologies) using default parameters to obtain background subtracted and spatially detrended processed signal intensities. Signal intensities were scaled by adjusting the average intensity value to 2500. For comparison of gene expression, False Discovery Rate (FDR) was calculated according to Benjamini-Hochberg method and probe sets with FDR ≤ 0.05 were considered statistically significant. Data mining was performed using Gene Spring GX 12.6 software (Agilent Technologies). Data were subjected to statistical analysis using Student's T test (Welch). P values less than 0.05 were considered statistically significant. Fold change threshold were 2 or more / 0.5 or less. The data have been deposited in National Center for Biotechnology Information's Gene Expression Omnibus, and is accessible through GEO series accession no. GSE45413.

ELISA. Blood was collected from the orbital sinus at indicated times after treatment. After centrifugation of collected blood (1000g for 20 minutes), serum was collected and stored at -80 °C until use. Culture supernatants were collected, spun at 500g for 5 minutes, and stored at -80 °C. Mouse TNF-α or IFN-γ ELISA (R&D Systems, Minneapolis, MN) were performed according to the manufacturer's instructions.

Western blot. Primary human HSCs were collected with a cell scraper after treatment with reagents. For the detection of p65, IκBα, lamin B, and GAPDH, nuclear and cytoplasmic proteins were isolated using Nuclear Extract Kit (Active Motif, Carlsbad, CA). SDS sample buffer (Nacalai Tesque) were added to protein solutions and heated at 99°C for 5 minutes. SDS-PAGE was performed from 10 μg of proteins and they were transferred on a PVDF membrane using iBlot (Invitrogen). Subsequent procedures, including blocking, treatment with first and secondary antibodies, and washing were performed with iBind (Invitrogen) according to the manufacturer's instructions. For the detection of pJNK, JNK, pp38, and p38, whole cell lysates were collected using Nuclear Extract Kit. Protein solutions were heated, and subjected to SDS-PAGE and transferred to PVDF membranes as described above. Membranes were then blocked with Blocking One (Nacalai Tesque) for 20 minutes and treated with primary antibodies diluted in Can

Get Signal Solution 1 (Toyobo). After three washes with TBS containing 0.1% Polyoxyethylene (20) sorbitan monolaurate (TBST), membranes were incubated with secondary antibodies diluted in Can Get Signal Solution 2 (Toyobo). They were washed three times in TBST. For each protein, chemiluminescent detection was done with Chemi Lumi One system (Nacalai Tesque) and the bands were visualized using Amersham Imager 600 (GE healthcare, Little Chalfont, UK). Band density was measured with Image J software. For the detection of lamin B, GAPDH, JNK, and p38, membranes were incubated in WB Stripping Solution Strong (Nacalai Tesque) for 30 minutes at 37 °C, washed, and treated with antibodies as described above.

NF-κB activity assay. Nuclear protein binding to a consensus NF-κB oligonucleotide was determined using an ELISA-based assay (TransAm p65; Active Motif, Carlsbad, CA). Nuclear extracts were prepared as described in Western Blot section and 2 μg of nuclear protein was loaded to each well. Absorbance was read at 450 nm and the value of blank well was subtracted from the data of measured samples.

Flow cytometry. Liver NPCs were collected as described above. After the cells were incubated with 10 μg/ml anti-CD16/32 antibody (Biolegend) for 15 minutes on ice and

washed, they were incubated with fluorochrome-conjugated antibodies for 30 minutes on ice, washed twice and analyzed by flow cytometry using a LSR Fortessa (BD Biosciences). Data analysis was performed using FlowJo software (Tree Star).

Intravital Microscopy. Hepatic microcirculation was visualized essentially as described (4, 5). Briefly, animals anesthetized with pentobarbital sodium (50 mg/kg, i.p.) were prepared for in vivo fluorescence microscopy 6 hours after ConA injection. For contrast enhancement of the plasma, FITC-labeled dextran (Sigma) was administered (4 mg/kg, i.v.). The hepatic microcirculation was observed at the surface of the liver using a fluorescence microscope (ECLIPSE FN1, upright type; Nikon, Tokyo, Japan) with a 100 W-mercury lamp for epi-illumination. The microscopic images were obtained with an objective lens (20x/0.75 N.A. or 40x/0.95 N.A.; Nikon). Images of the hepatic microcirculation were recorded with a CCD camera (Evolve 512, Photometrics, Tokyo, Japan) and image analysis software (StreamPix, Norpix, Canada). The blood perfusion through the sinusoids was evaluated by counting the number of sinusoids exhibiting blood flow. The number of perfused sinusoids was expressed as a percentage of total sinusoids in a field of view. For the visualization of leukocytes, GFP mice were injected with ConA and vehicle or BW245C. A leukocyte was defined as

adhering to the sinusoidal wall if it remained stationary for at least 30 seconds, and the number of leukocytes adhering to the endothelial lining of sinusoids was calculated per field.

Intracellular Ca^{2+} assay. Human HSCs cultured in poly-D-lysine-coated 96-well plate (Black, clear bottom. Corning) were labelled with Fluo 8 AM (AAT Bioquest, Sunnyvale, CA). Cells were preincubated with different concentrations of BW245C for 3 minutes, and treated with 10 nM endothelin-1 (Peptide Institute, Ibaraki, Japan). Relative fluorescence unit was monitored for 110 seconds. Assay was performed in triplicate with FlexStation (Molecular Devices, Sunnyvale, CA).

Statistical analysis. All data are shown as mean ± standard deviation (SD). Comparisons of two groups were analyzed using the unpaired two-tailed Student's t test. $P < 0.05$ was considered statistically significant. The analyses were performed by Graphpad Prism software (version 6; Graph Pad, La Jolla, CA).

(C) Phase-contrast image (left) and autofluorescence (right) of HSCs isolated from untreated mice. Bars, 100 μm.

Supporting Figure 2: Western blot for nuclear p65 and cytosolic IκBα proteins in TNF-α-stimulated HSCs in the presence of vehicle or BW245C. Primary human HSCs were stimulated with TNF-α in the presence of vehicle or 10 μM BW245C for the

indicated time periods. Nuclear and cytosolic proteins were extracted and subjected to Western Blot. Results are representatives of two independent experiments.

Supporting Figure 3: Serum AST and ALT levels of ConA-injected WT mice, mice deficient in each prostanoid receptor and mice treated with an EP4 antagonist. Mice were administered 10 mg/kg except for experiments using EP4 antagonist and IP KO mice, in which 20 mg/kg of ConA were given. Serum was collected 24 hours later for measurement. An EP4 antagonist AE3-208, 100 mg/kg/day, or vehicle was given to C57BL/6 mice in drinking water for 48 hours, from 24 hours before ConA injection until serum collection. Data are mean ± SD of two to five mice. **, $P < 0.01$ and *, $P < 0.05$, compared with WT. NS, non-significant.

Supporting Figure 4: Serum TNF-α levels in bone marrow chimeric mice. ConA, 10 mg/kg, and vehicle or 1 mg/kg BW245C were administered 12 weeks after bone marrow transplantation. Serum was collected at 1 hour. Data are mean ± SD of two to five mice. **, $P < 0.01$, compared with non-treated mice.

Supporting Figure 5: HPGDS immunostaining of liver section of non-treated (upper

row) and mice treated with ConA for 8 hours (lower row). Data show a representative of two mice. Scale bars, 100 μm.

Supporting Figure 6: (A) Serum IFN-γ concentration in Con A-injected mice with or without BW245C treatment. Dotted line, BW245C-treated group and solid line, vehicle-treated group. (B) Augmentation of IFN-γ production by co-culture of NPCs and spleen cells, and its suppression by BW245C. IFN-γ concentration in culture supernatants of NPCs alone (white), NPC-spleen cell co-culture (gray), or spleen cells alone (black) are shown. ***, $P < 0.001$,**, $P < 0.01$ and *, $P < 0.05$, compared with compared with Con A and vehicle-treated group. NS, non-significant. Data are expressed as mean ± SD of five wells and are representatives of at least two independent experiments.

Supporting Figure 7: Heatmap of genes up-regulated by Con A and suppressed by BW245C treatment at 3 hours and 24 hours in mouse livers. Clustering analysis of genes that showed up-regulated by Con A and suppressed by BW245C. N, non-treated mouse liver; V3 and V24, liver collected from Con A-injected, vehicle-treated mice at 3 and 24 h after Con A injection, respectively; D3 and D24, liver collected from Con

A-injected, BW245C-treated mice at 3 and 24 hours after Con A injection, respectively. Examples of TNF-α-upregulated genes (red) are *Tnfaip6*, *Sele*, *Edn1* and *Fos*, and examples of IFN-γ-regulated genes (blue) are *Socs3*, *Isg15*, and *Ifit2*. *F3* (tissue factor) and *Nos2* (iNOS) are up-regulated by both TNF-α and IFN-γ (purple). Data show mean intensity of five samples per group.

Supporting Figure 8: Sinusoidal congestion and leukocyte accumulation induced by ConA, their amelioration by BW245C treatment and prevention of ConA-induced hepatitis by pretreatment with endothelin antagonist.

(A) Sinusoidal visualization by injection of FITC-dextran. Representative *in vivo* fluorescence images of hepatic microcirculation 6 hours after ConA injection with either vehicle or BW245C treatment. Bars, 100 μm (upper row) and 30 μm (lower row). PP, periportal region; CL, centrilobular region. (B) Quantification of perfused sinusoids. Data are shown as mean ± SD of six mice per group. (C) Leukocyte adherence to the sinusoidal wall. GFP mice were administered ConA with either vehicle or BW245C treatment. Leukocyte adherence was examined at 6 hours. (D) Number of leukocytes adhered to the sinusoidal wall. Data are expressed as mean ± SD of five to six mice per group. (E) Concentration-dependent effects of BW245C on *EDN1* mRNA expression in

primary human HSCs. Human HSCs were treated with different concentrations of BW245C for 6 hours, and subjected to RNA extraction and QRT-PCR analysis. Data are expressed as mean ± SD of triplicate wells and are representatives of at least two independent experiments. (F) Effects of an ET_A antagonist BQ-123 (top) or an ET_B antagonist BQ-788 (middle) on ConA-induced hepatitis. Drugs were administered i.p. 30 minutes before ConA injection, and serum was collected 24 hours after the injection for AST and ALT measurement. The results are expressed as mean ± SD of three to six mice per group. *, $P < 0.05$ compared with ConA and vehicle-administered mice. (Bottom) H&E staining of the liver from ConA injected mice with or without BQ-123 pretreatment. Samples were collected 24 hours after ConA injection. (-), non-treated group (B and D). Shown are representatives of three mice. Bars, 200 μm.

Supporting Figure 9. Intracellular Ca^{2+} assay of human HSCs stimulated with endothelin-1 (EDN-1) in the presence of vehicle or BW245C.

Human HSCs were pretreated with 10 μM BW245C for 3 minutes and 30 nM EDN-1 or vehicle was added. Relative fluorescence intensity was measured 110 seconds later. Data are mean ± SD of three wells and are a representative of three independent experiments.

Supporting Table 1.

Genes that decreased by more than 2 fold in livers of mice treated with Con A and BW245C for 3 hours compared with livers of mice treated for 3 hours with Con A and vehicle.

Supporting Table 2. Antibody List.

First antibodies for immunostaining

Antibody	Product ID	Manufacturer	Clone
DP1	101640	Cayman Chemical	Polyclonal
Desmin	ab6322	Abcam	DE-U-10
F4/80	ab16911	Abcam	BM8
CD31	550274	BD Biosciences	MEC13.3
Vimentin	550513	BD Pharmingen	RV202
HPGDS	10004349	Cayman Chemical	7H4
Phospho-p65 (Ser536)	3033	CST (Cell Signaling Technology)	93H1
TNF-α	ab34674	Abcam	Polyclonal
CCL2	AAM43	AbD Serotec	Polyclonal
VCAM-1	ab27560	Abcam	MVCAM.A (429)
iNOS	ab15323	Abcam	Polyclonal
Tissue factor	ab151748	Abcam	EPR8986
Gr-1	ab2557	Abcam	NIMP-R14
CD3	ab16669	Abcam	SP7

Secondary antibodies for immunostaining

Antigen	Format	Product ID	Manufacturer
Rabbit IgG	Alexa Fuor 488	A-21206	Molecular Probes
Rabbit IgG	Alexa fluor 594	A-21207	Molecular Probes
Rat IgG	Alexa Fluor 488	A-21208	Molecular Probes
Rat IgG	Alexa Fluor 594	A-21209	Molecular Probes

First antibodies for Western Blot

Antibody	Product ID	Manufacturer	Clone
p65	sc-372	Santa Cruz	Polyclonal
IkBα	sc-371	Santa Cruz	Polyclonal
JNK	9252	CST	Polyclonal
pJNK	9251	CST	Polyclonal
p38	9212	CST	Polyclonal
pp38	9211	CST	Polyclonal
GAPDH	AM4300	Life Technologies	6C5
Lamin B	sc-6216	Santa Cruz	Polyclonal

Secondary antibodies for Western Blot

Antigen	Format	Product ID	Manufacturer
Rabbit IgG	HRP	NA934	GE Healthcare
Mouse IgG	HRP	NA931	GE Healthcare
Goat IgG	HRP	PI-9500	Vector Laboratories

Antibodies for flow cytometry

Antigen	Format	Product ID	Manufacturer	Clone
CD3e	PE-Cyanine 5	12-0031	eBioscience	145-2C11
Gr1	PE	12-5931	eBioscience	RB6-8C5

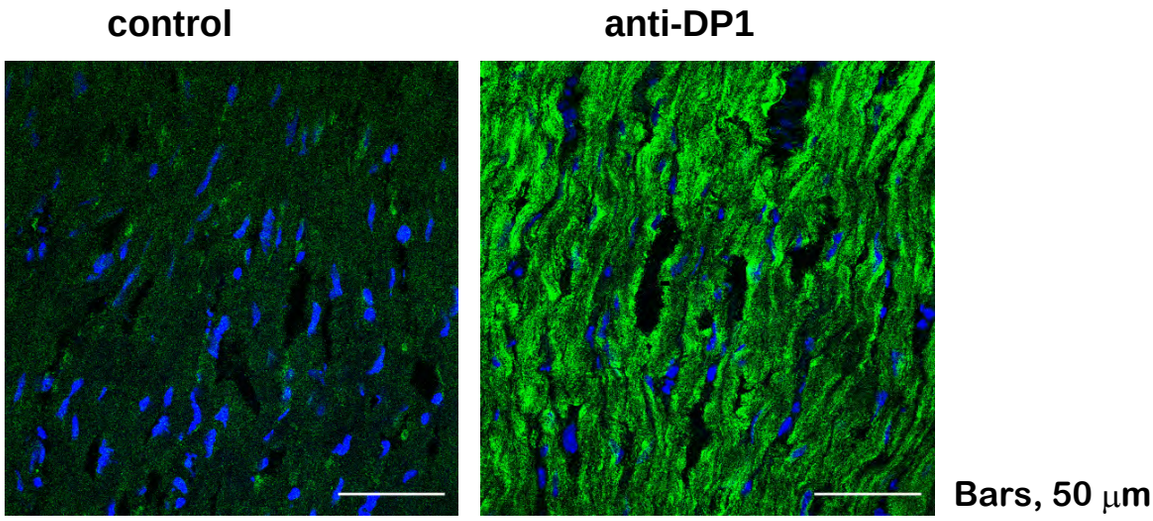
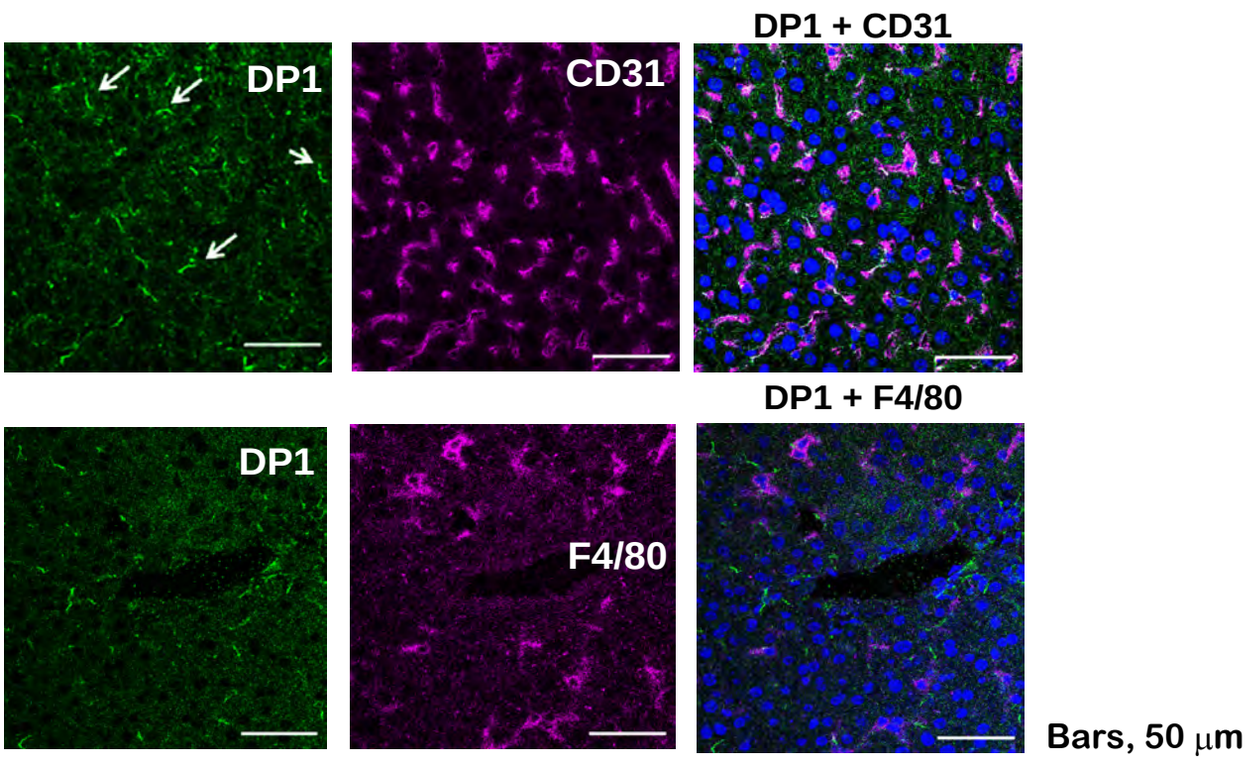
Supporting Figure 1.

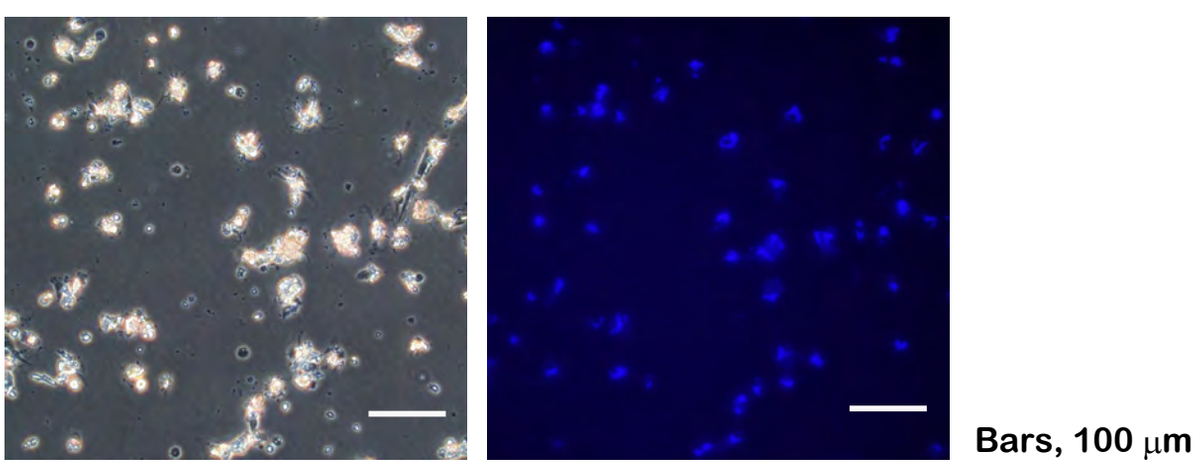
(A) DP1 immunostaining of mouse ileum.



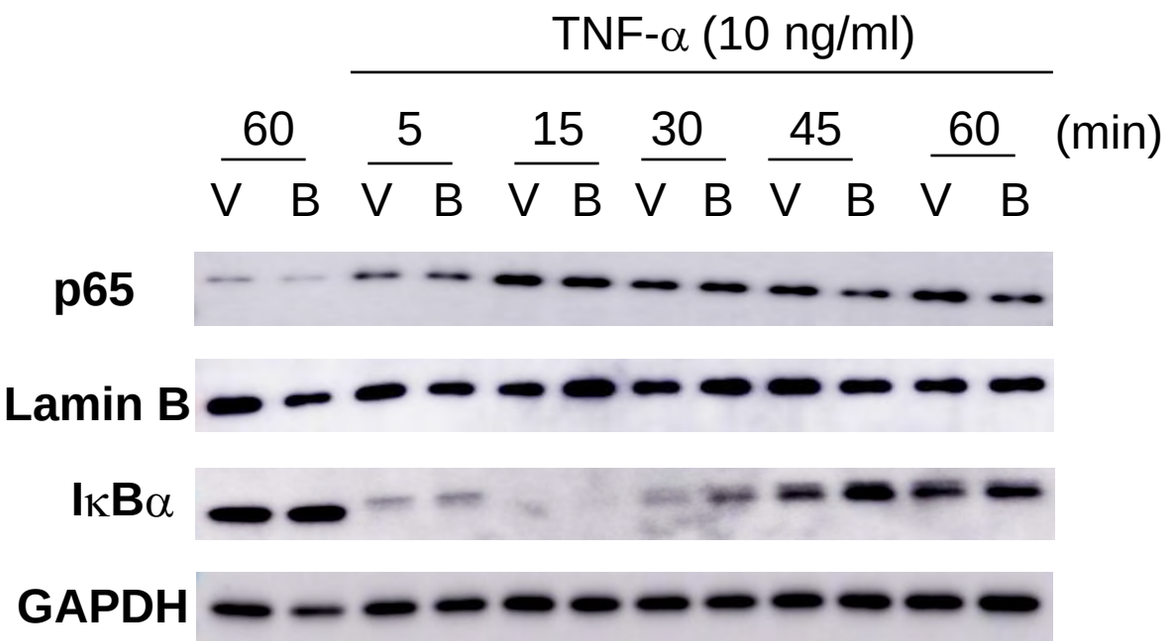
(B) Expression of DP1, CD31, and F4/80 in mouse liver.



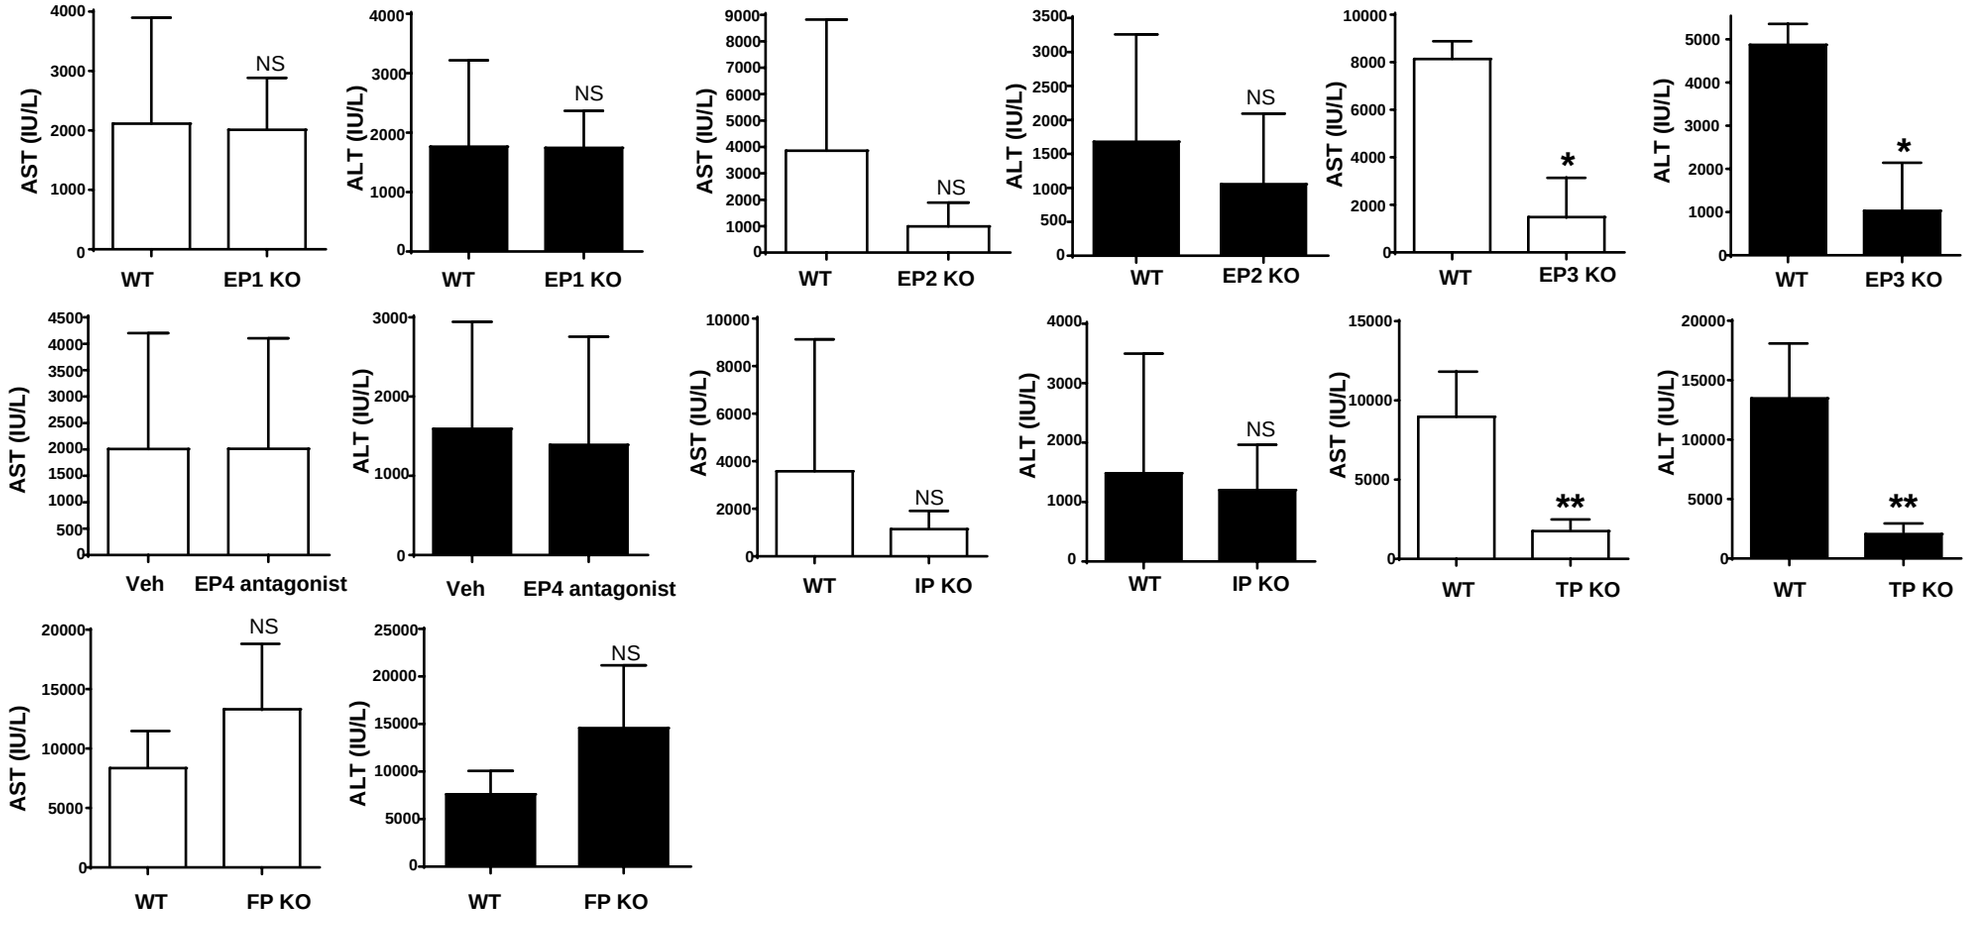
(C) Morphology and autofluorescence of isolated mouse HSCs



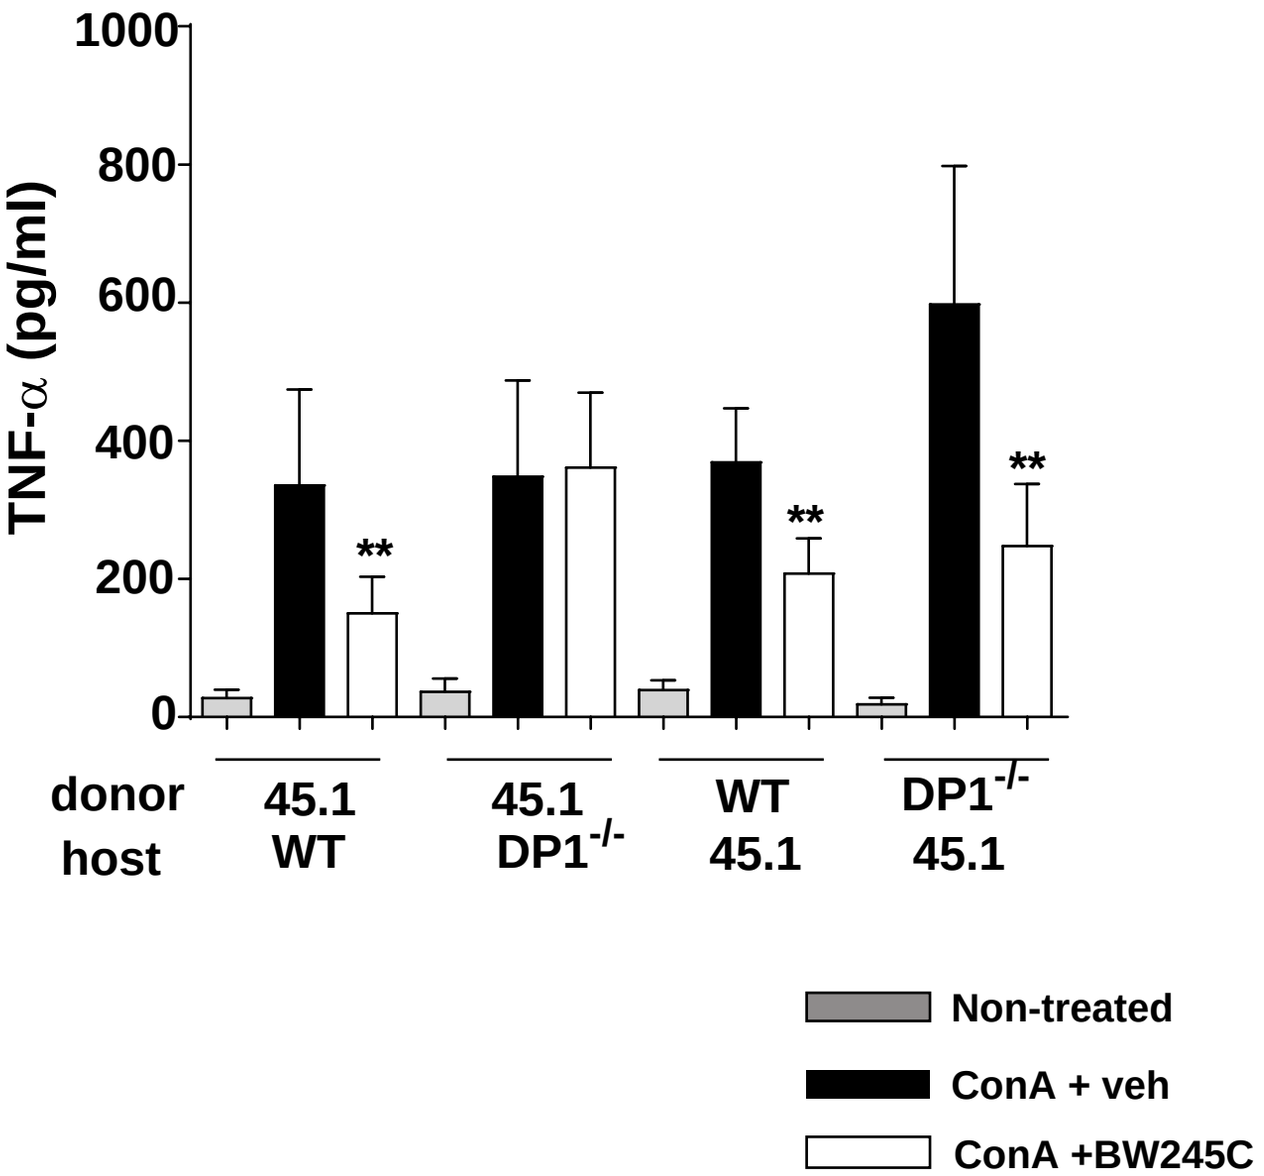
Supporting Figure 2. Time course of nuclear p65 and cytosolic IκBα proteins after stimulation of human HSCs with TNF-α and vehicle or BW245C.



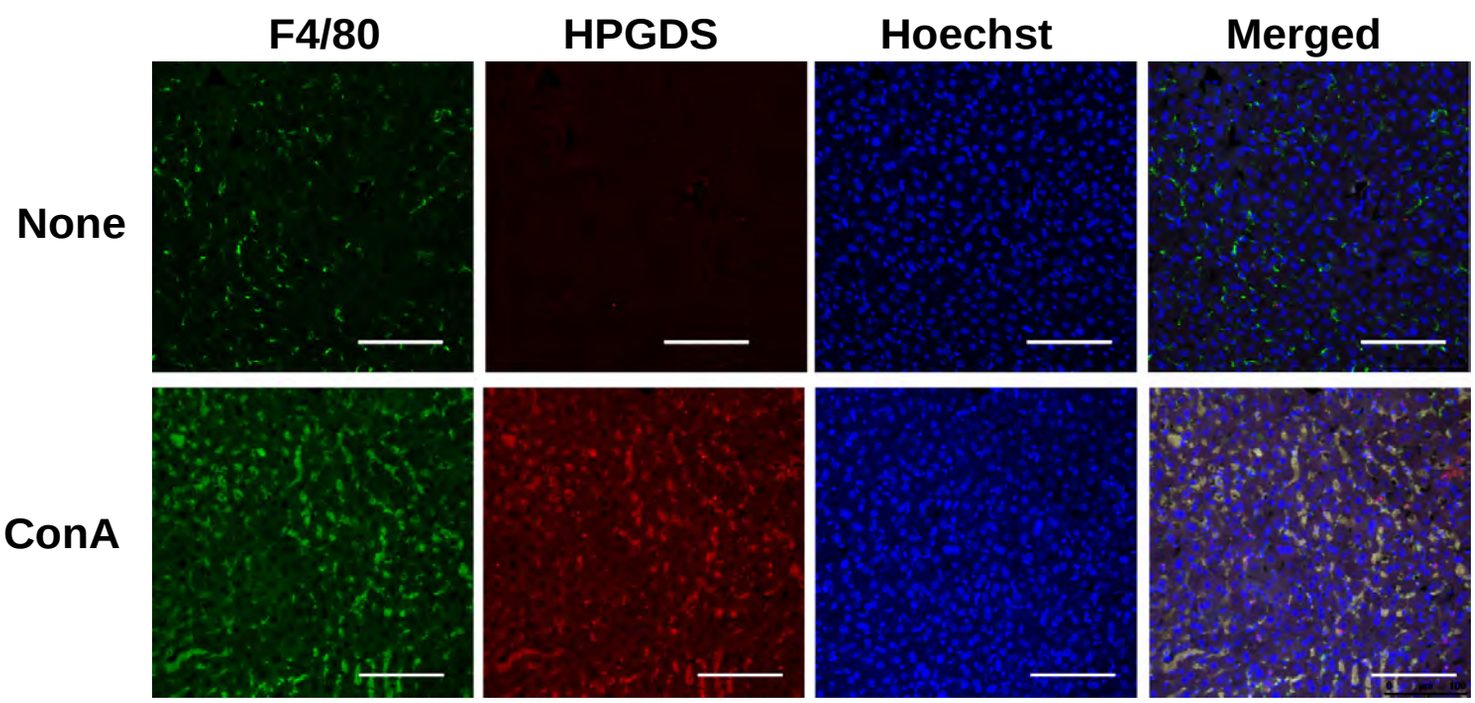
Supporting Figure 3. Serum AST and ALT levels of WT mice, prostanoid receptor-deficient mice, and mice treated with an EP4 antagonist subjected to ConA-induced hepatitis.



Supporting Figure 4. Effects of BW245C on serum TNF-α levels of bone marrow chimeras.

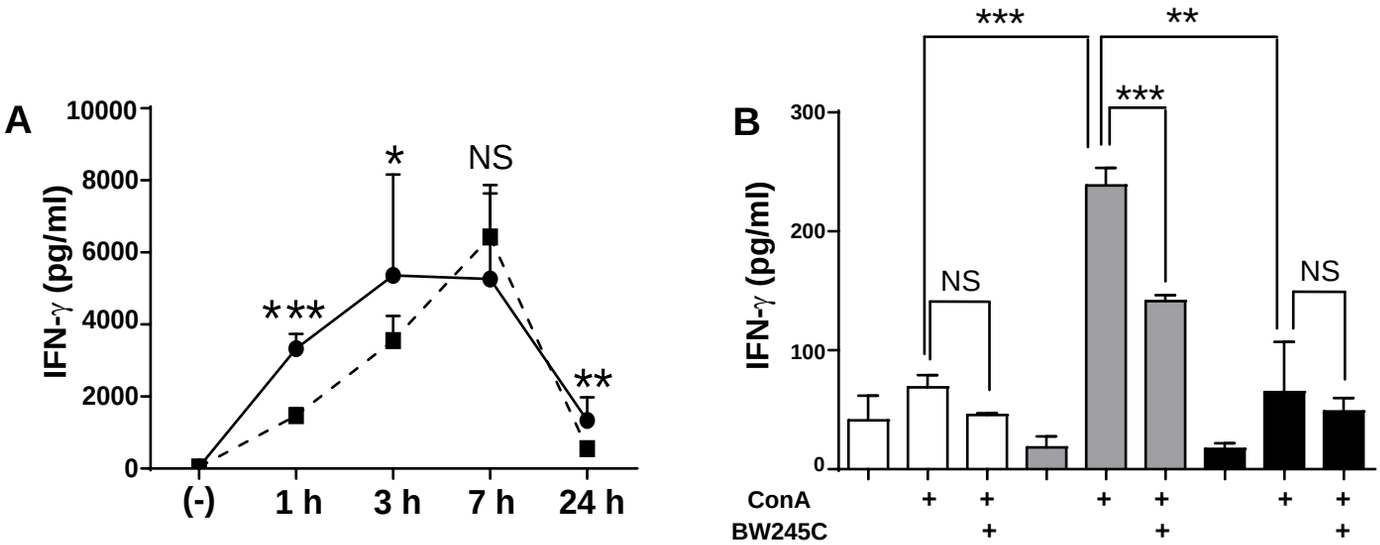


Supporting Figure 5. HPGDS immunostaining in mouse livers treated with ConA for 8 hours.

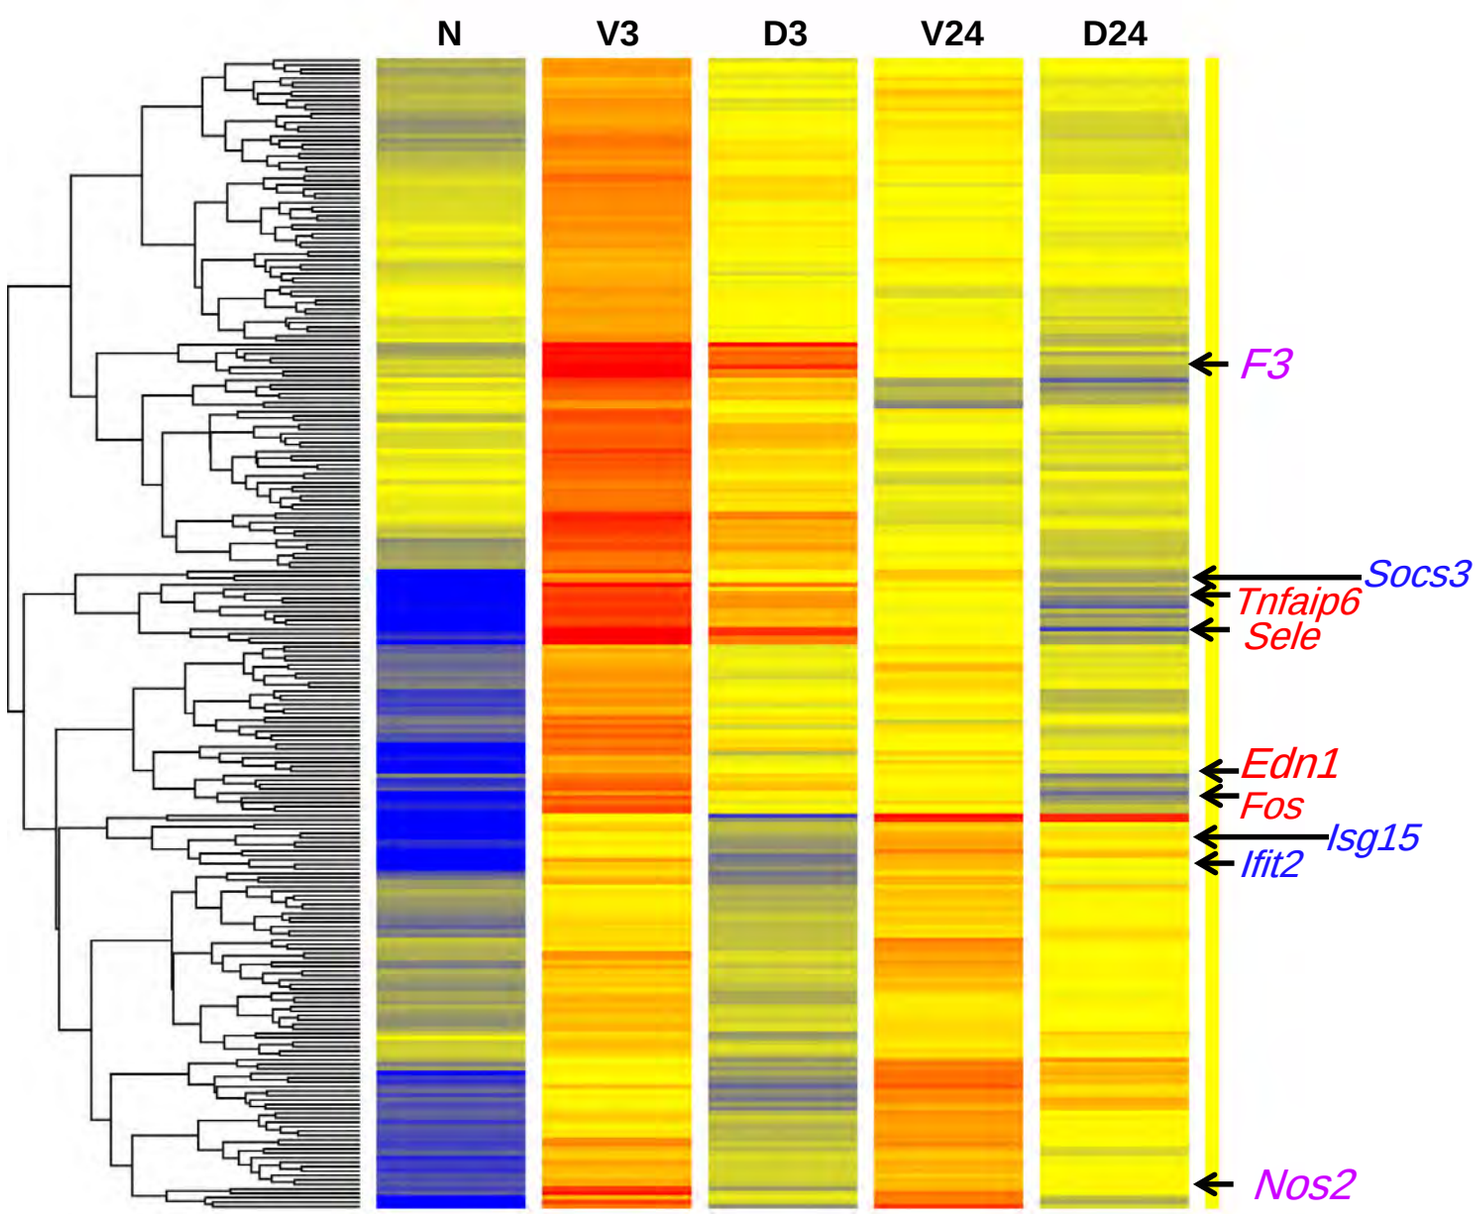


Bars, 100 μm

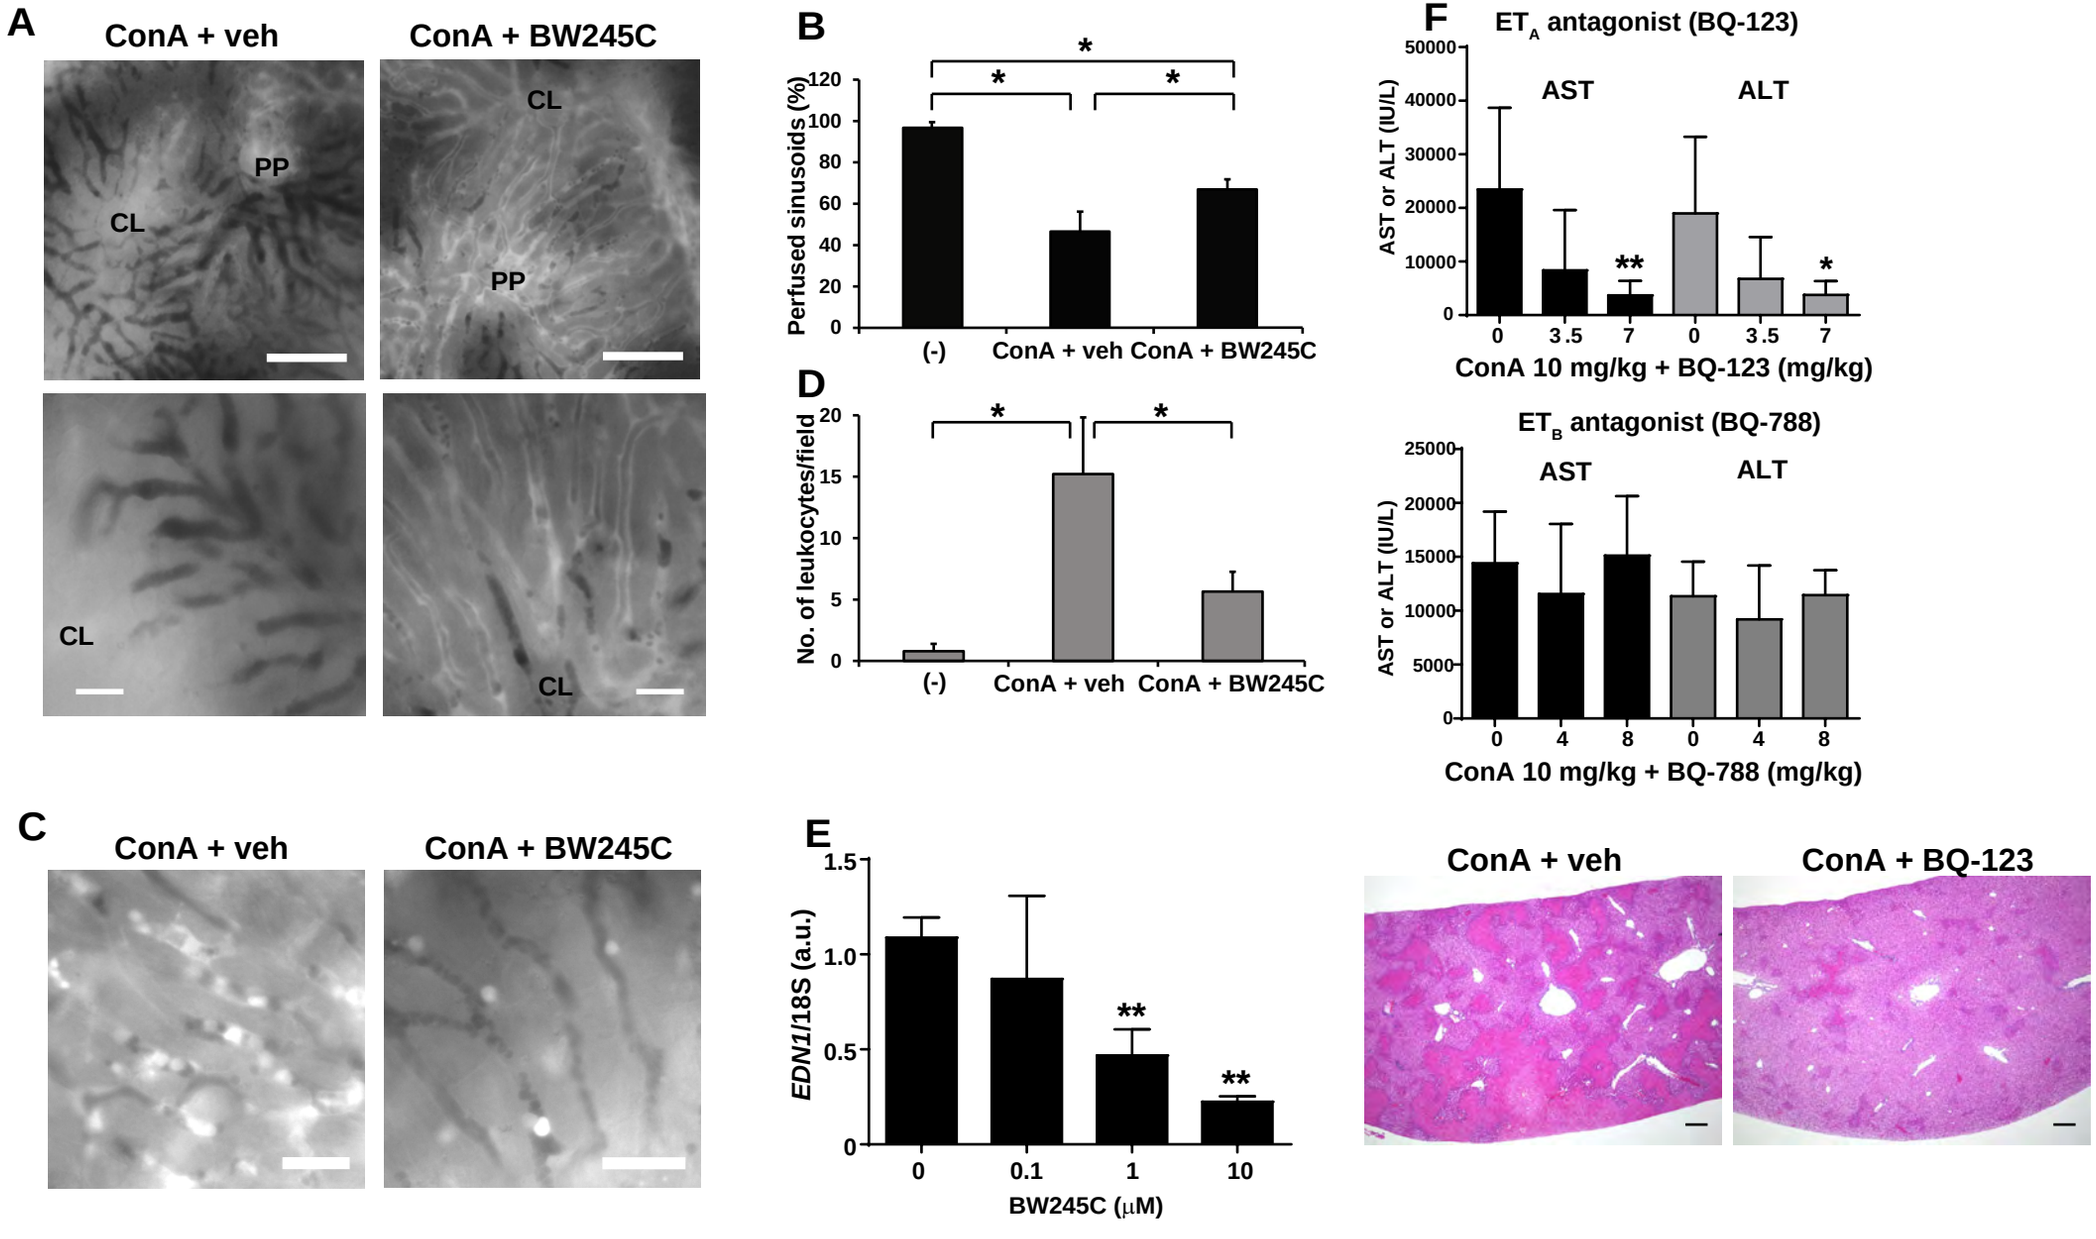
Supporting Figure 6. IFN-γ concentrations in sera of ConA - injected mice (A) and in vitro co-culture system (B).



Supporting Figure 7. Clustering analysis of genes that showed changes similar to that of *nos2* in response to ConA injection and BW245C treatment.



Supporting Figure 8. Sinusoidal congestion induced by ConA is ameliorated by BW245C.



Supporting Figure 9. Intracellular Ca^{2+} assay of human HSCs stimulated with endothelin-1 (EDN-1) in the presence of vehicle or BW245C.
