AUTOMORPHISMS ON K3 SURFACES

D.-Q. Zhang
Math. Dept. National Univ. of Singapore

e-mail : matzdq@nus.sg

This is an expository note on our recent works with K. Oguiso. In the present note, we shall often use the following notations and assumptions:

(*) $X$ is a projective K3 surface, $\sigma$ an automorphism on $X$ of order $m$ $(m \geq 2)$, $\zeta_m := \exp(2\pi \sqrt{-1}/m)$, $\omega$ a non-zero holomorphic 2-form on $X$ and $T_X = (\text{Pic}_X)^\perp \subseteq H^2(X, \mathbb{Z})$ the transcendental lattice of $X$ [BPV].

Theorem 1 [Ni 1]. With the notations and assumptions in (*), suppose further that $\sigma^* \omega$ acts trivially on the 1-dimensional space $H^0(X, \mathcal{O}_X(K_X))$ of holomorphic 2-forms, i.e., $\sigma^* \omega = \omega$. Then $m \leq 8$.

In view of Theorem 1, we consider the following hypothesis:

(**) With the notations and assumptions in (*), assume further that $\sigma^* \omega = \zeta_m \omega$.

Under the hypothesis (**), the Euler number $\varphi(m)|\text{rk} T_X$, and hence one has [Ni 1]:

$m \leq 66$ and $p \leq 19$ for every prime factor $p$ of $m$. 

The following result can be obtained by the Hodge index theorem and by considering the diagonalization of $\sigma^*$ at its fixed-points.

**Lemma 2.** Assume that the pair $(X, \sigma)$ satisfies the hypothesis (**).

1. The set $X^{<\sigma>} = \{ x \in X | \sigma^i(x) = x \text{ for some } \sigma^i \neq id \}$ of points with non-trivial stabilizer, is a disjoint union of smooth curves and isolated points.

2. If $X^{<\sigma>}$ contains a curve $C$ of genus $\geq 2$, then $X^\sigma$ is a disjoint union of $C$, smooth rational curves and isolated points.

**Theorem 3** (see [Z3, Theorems 3 and 3']). Let $X$ be a projective K3 surface with an involution $\sigma$ such that $\sigma^* \omega = -\omega$.

1. The fixed locus $X^\sigma$ is a disjoint union of $r$ smooth curves for some $r \leq 10$.

   If $r = 10$ then $X^\sigma$ is a union of 9 smooth rational curves and a smooth curve $C$ of genus 0, 1 or 2.

2. All pairs $(X, \sigma)$, modulo isomorphisms, in (1) with $r = 10$ and $g(C) = 1$ (resp. $g(C) = 2$) are parametrized by a subset of $\mathbb{P}^1$ (resp. of $\mathbb{P}^3$).

3. There is a unique (modulo isomorphisms) pair $(X, \sigma)$ such that $X^\sigma$ is a union of 10 rational curves. Such $X$ has Picard number 20 and discriminant 4 and hence has infinite automorphism group $\text{Aut}X$.

**Remark 4.** (1) For $X$ in Theorem 3(3) "$\# \text{Aut}X = \infty$" was first proved by T. Shioda–H. Inose [SI]; such $X$ is called one of the two most algebraic K3 surfaces by E. B. Vinberg [V] who also determined $\text{Aut}X$ (see Remark 15, and Example 6, also for the construction of $X$).

(2) Nikulin claimed that some results in Theorem 3 has been proved in [Ni 2], though
the author has not found any clear statements similar to Theorem 3 above and will try to read [Ni 2] again later.

**Theorem 5** [OZ1, Theorems 3 and 4]. Let $X_m$ be a projective K3 surface with an automorphism $\sigma$ of order $m$ where $m = 3$ (resp. 2) such that

(i) $\sigma^\ast \omega = \zeta_m \omega$,

(ii) there is no any $\sigma$-fixed curve (point-wise) of genus $\geq 2$, and

(iii) there are at least 6 (resp. 10) $\sigma$-fixed rational curves.

Then such a pair is unique up to isomorphisms, and isomorphic to Shioda-Inose’s pair $(S_m, g_m)$ to be defined below.

**Example 6** (see [OZ1, Examples 1 and 2] for details). Let $\zeta := \exp(2\pi \sqrt{-1}/3)$ and let $E_\zeta := C/(Z + Z\zeta)$ be the elliptic curve of period $\zeta$. Let $S_3 \to \overline{S}_3 := E_\zeta^2/ < \text{diag}(\zeta, \zeta^2)>$ be the minimal resolution of the quotient surface $\overline{S}_3$ [SI, Lemma 5.1].

Then $S_3$ is the unique projective K3 surface of Picard number 20 and discriminant 3. Let $g_3$ be the automorphism of $S_3$ induced by the action $\text{diag}(\zeta, 1)$ on $E_\zeta^2$. Then this Shioda-Inose pair $(S_3, g_3)$ satisfies all conditions in Theorem 5 with $m = 3$.

Let $E_{-1} := C/(Z + Z\sqrt{-1})$ be the elliptic curve of period $\sqrt{-1}$. Let $S_2 \to \overline{S}_2 := E_{-1}^2/ < \text{diag}(-\sqrt{-1}, \sqrt{-1})>$ be the minimal resolution of the quotient surface $\overline{S}_2$ [SI, Lemma 5.2].

Then $S_2$ is the unique projective K3 surface of Picard number 20 and discriminant 4. Let $g_2$ be the automorphism of $S_2$ induced by the action $\text{diag}(-1, 1)$ on $E_{-1}^2$. Then this Shioda-Inose pair $(S_2, g_2)$ satisfies all conditions in Theorem 5 with $m = 2$.

**Corollary 7** [OZ1, Theorems 1 and 2]. There is only one isomorphism class of rational
Let $Z$ be a rational normal projective surface with at worst isolated quotient singular points. $Z$ is a (rational) log Enriques surface if a positive multiple $mK_Z$ of the canonical Weil divisor $K_Z$ is linearly equivalent to zero.

$m := \min\{n \in \mathbb{Z}_{>0} | nK_Z \sim 0\}$ is called the index of $Z$. Let

$$\pi : Y := \text{Spec} \bigotimes_{i=0}^{m-1} \mathcal{O}_Z(-iK_Z) \to Z$$

be the canonical Galois $\mathbb{Z}/m\mathbb{Z}$-covering. By the definition, we have:

**Lemma 8.** (1) $\pi$ is unramified over the smooth part $Z - \text{Sing}Z$.

(2) $Y$ is a projective $K3$ surface with at worst Du Val (= rational double) singular points. Let $g : X \to Y$ be a minimal resolution.

(3) Let $\sigma$ be an order-$m$ automorphism on $X$ (or on $Y$) coming from the map $\pi$ so that $\text{Gal}(Y/Z) = < \sigma >$. Then $\sigma^*\omega = \zeta_m\omega$, after replacing $\sigma$ by a new generator of $\text{Gal}(Y/Z)$.

By Lemma 8(3), we can apply Lemma 2 (here $m \geq 2$ because $Z = Y/\sigma$ is rational).

**Remark 9.** The following two things are essentially equivalent:

(A) A pair $(X, \sigma)$, where $X$ is a projective $K3$ surface and $\sigma$ an order $m$ ($m \geq 2$) automorphism on $X$ such that $\sigma^*\omega = \zeta_m\omega$ and that $X^{<\sigma>}$ is non-empty but consists of only rational curves and isolated points. By Lemma 2, $X^{<\sigma>}$ is now a disjoint union of smooth rational curves and isolated points.

(B) A (rational) log Enriques surface $Z$ of index $m$.

In fact, for (B) $\Rightarrow$ (A), we define $X, \sigma$ as in Lemma 8.
For (A) \( \Rightarrow \) (B), we let \( X \to Y \) be a contraction of a \( \sigma \)-stable divisor \( D \) containing all curves in \( X^{<\sigma>} \), into Du Val singular points. Now Define \( Z := Y/\sigma \).

**Question 10.** Let \( Z \) be a rational log Enriques surface of index \( m \) with \( \pi : Y \to Z \) as its canonical covering.

We know that \( Y \) is a projective K3 surface with at worst singular points of Dynkin types \( A_r \) (\( r \geq 1 \)), \( D_s \) (\( s \geq 4 \)) and \( E_t \) (\( t = 6, 7, 8 \)).

What is the possible combination of Dynkin types of singular points on \( Y \)?

**Definition 11.** A log Enriques surface \( Z \) is of Type \( A_r + D_s + E_t + \cdots \) if the canonical covering \( Y \) of \( Z \) satisfies \( \text{Sing } Y = A_r + D_s + E_t + \cdots \).

**Remark 12.** The sum of "weights" \( r + s + t + \cdots \) in Definition 11 has an upper bound 19, because the Picard number of a K3 surface has an upper bounded 20.

\( Z \) is an **extremal log Enriques surface** if this sum \( r + s + t + \cdots \) equals 19.

**Theorem 13** [OZ3, Main Theorem]. There are exactly 7 isomorphism classes of extremal (rational) log Enriques surfaces. Their Types are as follows:

\[
D_{19}, D_{16} + A_3, D_{13} + A_6, D_7 + A_{12}, D_7 + D_{12}, D_4 + A_{15}, A_{19}.
\]

**Example 14.** Let \( (S_m, g_m) \) (\( m = 2, 3 \)) be Shioda-Inose's pairs in Example 6. On \( S_m \) where \( m = 3 \) (resp. 2), there are 24 normal crossing \( (g_m\)-stable) smooth rational curves shown in [OZ1, Figures 1 and 2] or [SI, Figures 2 and 3]; among these 24, there are divisors \( \Delta_i \) of the first six Dynkin types (resp. divisor \( \Delta_7 \) of Dynkin type \( A_{19} \)) in Theorem 13.
Let $S_m \to \overline{S}_m$ be the contraction of $\Delta_i$ and let $Z(i) := \overline{S}_m/g_m$. Then $Z(i)$'s are nothing but 7 extremal rational log Enriques surfaces in Theorem 13.

**Remark 15.** (1) Every K3 surface of (maximum possible) Picard number 20 satisfies $\text{discr.} X \geq 3$ [Sl]. This might be the reason why Vinberg call the two K3 surfaces $X$ with Picard number 20 and $\text{discr.} X = 3, 4$, the most algebraic K3 surfaces.

(2) The same rational log Enriques surfaces of Type $D_{19}$ and $A_{19}$ were constructed by "bottom up" (rather than "top down" here) in [Z1]. I. Naruki and M. Reid then asked about the uniqueness of these two surfaces. See Reid [R] for his result towards a kind of uniqueness theorem.

We know that there is a unique rational log Enriques surface of Type $D_{19}$ and one of Type $A_{19}$. One may ask the same uniqueness question for $D_n, A_n$ with smaller $n$. The following are some of the answers, where $D_{17} + \ast$, etc. means $D_{17} +$ something.

**Theorem 16** [OZ2, Theorems 1 and 2]. There is exactly one (resp. two) isomorphism class(ies) of rational log Enriques surface(s) of Type $D_{18} + \ast$ (= $D_{18}$ as a matter of fact) (resp. $A_{18} + \ast$ (= $A_{18}$ as a matter of fact)).

**Theorem 17.** [Z5, Theorem 4]. There is no any rational log Enriques surface of Type $D_{17} + \ast$.

**Theorem 18** [OZ4, Z4, Z5]).

(1) Any rational log Enriques surface of Type $A_{17} + \ast$ has index 2, 3, 4, or 5.

(2) There are exactly two isomorphism classes of rational log Enriques surfaces of
Type $A_{17} + \ast$ (as a matter of fact) and index 5 (cf. Theorem 19 and Remark 20).

3. There are exactly three isomorphism classes of rational log Enriques surfaces of Type $A_{17} + \ast$ (as a matter of fact) and index 4.

4. There is at least one and at most three isomorphism classes of rational log Enriques surfaces of Type $A_{17} + \ast$ (as a matter of fact) and index 3.

5. There are exactly three isomorphism classes of rational log Enriques surfaces of Type $A_{17} + A_1$ and index 2.

**Theorem 19** (cf. [OZ5, Theorem 4] and [OZ5]). Let $Z$ be a rational log Enriques surface of Type $A_{17}$ and index 5. Let $Y \to Z$ be the canonical $\mathbb{Z}/5\mathbb{Z}$-covering, $X \to Y$ a minimal resolution, and $\sigma$ an order-5 automorphism on $X$ (or on $Y$) such that $\text{Gal}(Y/Z) = \langle \sigma \rangle$. Then we have:

\[ (* \ast \ast *) \text{discr.} X = 5, \quad \langle \sigma \rangle = \text{Ker}(\text{Aut}X \to \text{Aut}(\text{Pic}X)), \text{and the Euler number } \varphi(5) = \text{rk} T_X. \]

**Remark 20.** According to the result (announced in a 3-page paper by S. P. Vorontsov but without detailed proof), there is only one isomorphism class of $X$ with a $\sigma$ satisfying $(\ast \ast \ast)$ above. We have a detailed proof of the same result [OZ5]. Kondo [Ko] has constructed such a pair $(X, < \sigma >)$.

For general $m$, we have the following results:

**Theorem 21** [OZ5]. Let $X$ be a projective $K3$ surface with an automorphism $\sigma$ of order $m$ where $m = 2$ (resp. 3, 5, 7, 11, 13, 17, or 19) such that

(i) $\sigma^*|\text{Pic}X = \text{id},$
(ii) $\sigma^*\omega = \zeta_m\omega$, and

(iii) there is no any $\sigma$-fixed curve of genus $\geq 2$, and there are at least 10 (resp. 6, 3, 2, 1, 1, 0, or 0) $\sigma$-fixed rational curves.

Then such a pair $(X, \sigma)$ is unique up to isomorphisms. Moreover, $\text{discr}.X = m$.

Let $X$ be a projective K3 surface and let $H_X := \ker(\text{Aut}X \to \text{Aut(Pic}X))$. Then $H_X$ is a finite cyclic group of order $m_X$ say $[\text{Ni} 1]$. By $[\text{Ni} 1]$, $\varphi(m_X)\text{rk}T_X$. Kondo [Ko] determined all possible values of $m_X$; in particular, if $T_X$ is non-unimodular, then either $m_X$ is prime with $2 \leq m \leq 19$, or $m_X = 2^r$ ($r = 0, 2, 3, 4$), $3^s$ ($s = 2, 3$), or 25.

**Corollary 22** [OZ5]. There is a unique projective K3 surface such that $m_X$ is prime and $\varphi(m_X) = \text{rk}T_X$. Moreover, such $X$ satisfies $\text{discr}.X = m_X$.

When $m = 13, 17$ or 19, we can prove that all conditions (i), (ii) and (iii) in Theorem 21 will be satisfied automatically. That is, we have:

**Corollary 23** [OZ5]. For each of $m = 13, 17$ and 19, there is exactly one isomorphism class of projective K3 surface with an automorphism of order $m$.
