

ON MIXED HODGE STRUCTURE OF CHARACTER VARIETIES

Arata Komyo

Department of Mathematics, Graduate School of Science, Kobe University, D2

Abstract

In this poster, we study a variety, called character variety $\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}$, whose points parametrize representation of the fundamental group of k -punctured Riemann surface of genus g into $\text{GL}(n, \mathbb{C})$. In particular, we investigate the mixed Hodge structure of character varieties. There exists very interesting conjectures. For example,

Conjecture 1.2.1 of [1]

We have the following

- (i) The compactly supported mixed Hodge polynomial $H_c^*(\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}; x, y, t)$ is a polynomial in xy and t , and is independent of the choice of generic eigenvalues of multiplicities μ .
- (ii) Moreover,

$$H_c^*(\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}; x, y, t) = (t\sqrt{q})^{\dim(\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g})} \mathbb{H}\mu\left(-\frac{1}{\sqrt{q}} t\sqrt{q}\right),$$

where $q := xy$, and $\mathbb{H}\mu(z, w)$ is the rational function defined in [1].

Here

$$H_c^*(X; x, y, t) := \sum \dim_{\mathbb{C}}(G_{i,p}^F G_{i,q}^{P+Q} H_c^j(X)^{\mathbb{C}}) x^p y^q t^j.$$

The main result

Conjecture 1.2.1 (i) is true.

λ -connection

Definition

Let Σ be a compact Riemann surface of genus g .

Fix

We fix

- k -distinct points p_1, \dots, p_k in Σ ,
- $\mu = (\mu^1, \dots, \mu^k)$, where $\mu^i = (\mu_{r_1}^i, \dots, \mu_{r_j}^i)$ such that $\mu_1^i \geq \mu_2^i \geq \dots$ are non-negative integers and $\sum_j \mu_j^i = n$ for each i ,
- integers d, n with $n > 0$.

We put $\Sigma_0 = \Sigma \setminus \{p_1, \dots, p_k\}$, and

$$\Xi_h^{\mu, \lambda}(d) := \left\{ \left(\lambda, \{\xi_j^i\}_{\substack{1 \leq i \leq k \\ 1 \leq j \leq r_i}} \right) \in \mathbb{C} \times \mathbb{C}^{\sum r_i} \mid \lambda d + \sum_{i,j} \mu_j^i \xi_j^i = 0 \right\}.$$

We take a member $(\lambda, \xi) \in \Xi_h^{\mu, \lambda}(d)$, where $\xi = (\xi_j^i)_{\substack{1 \leq i \leq k \\ 1 \leq j \leq r_i}}$,

Parabolic λ -connection

We say $(E, \nabla, \{\xi_j^i\}_{1 \leq i \leq k})$ a ξ -parabolic λ -connection of rank n and degree d of type μ if

- (1) E is an algebraic vector bundle on Σ of rank n and degree d ,
- (2) $\nabla : E \rightarrow E \otimes \Omega_{\Sigma}^1(p_1 + \dots + p_k)$ is a λ -connection, that is, ∇ is a homomorphism of sheaves satisfying $\nabla(fa) = \lambda a \otimes df + f \nabla(a)$ for $f \in \mathcal{O}_{\Sigma}$ and $a \in E$, and
- (3) for each p_i , $\{l_r^i\}$ is a filtration $E|_{p_i} = l_1^i \supset l_2^i \supset \dots \supset l_{r_i}^i \supset l_{r_i+1}^i = 0$ such that $\dim(l_j^i/l_{j+1}^i) = \mu_j^i$ and $(\text{Res}_{p_i}(\nabla) - \xi_j^i \text{id}_{E|_{p_i}})(l_j^i) \subset l_{j+1}^i$ for $j = 1, \dots, r_i$.

Moduli space

Moduli space

There exists a relative coarse moduli scheme

$$\begin{aligned} \pi : \mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d} &\rightarrow \Xi_h^{\mu, \lambda}(d) \\ (E, \nabla, \{\xi_j^i\}_{1 \leq i \leq k}) &\mapsto (\lambda, \xi) \end{aligned}$$

of α -stable ξ -parabolic λ -connections of rank n and degree d of type μ . Moreover, π is smooth and $\mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$ is nonsingular.

We denote the fiber of (λ, ξ) by $\mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, \xi, g, d}$. In particular, we put $\mathcal{M}_{D, R, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$ and $\mathcal{M}_{D, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$ in the case of $\lambda = 1$ and $\lambda = 0$ respectively.

Compactification of the moduli space

There exists a natural \mathbb{C}^\times -action on $\mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$

$$t \cdot (E, \nabla, \{\xi_j^i\}) = (E, t\nabla, \{t\xi_j^i\}).$$

The following \mathbb{C}^\times -action on $\Xi_h^{\mu, \lambda}(d)$ is well-defined,

$$t \cdot (\lambda, \xi) = (t\lambda, t\xi).$$

Then, $\pi : \mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d} \rightarrow \Xi_h^{\mu, \lambda}(d)$ is a \mathbb{C}^\times -equivariant morphism.

Let \mathcal{M}' be the base change of $\mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$ via $\mathbb{C} \times \Xi_h^{\mu, \lambda}(d) \rightarrow \Xi_h^{\mu, \lambda}(d)$,

given by $(x, (\lambda, \xi)) \mapsto (x\lambda, x\xi)$. Here the \mathbb{C}^\times -action on $\mathbb{C} \times \Xi_h^{\mu, \lambda}(d)$ is given by $t \cdot (x, (\lambda, \xi)) = (tx, (t\lambda, t\xi))$. Then, the set $U \subset \mathcal{M}'$ of points $u \in U$ such that $\lim_{t \rightarrow \infty} t \cdot (E, \nabla, \{\xi_j^i\})$ does not exist is open, and there exists a geometric quotient $\overline{\mathcal{M}} := U/\mathbb{C}^\times$ which is proper over $\Xi_h^{\mu, \lambda}(d)$ via the induce map $\tilde{\pi} : \overline{\mathcal{M}} \rightarrow \Xi_h^{\mu, \lambda}(d)$.

Theorem 1

The induce map $\tilde{\pi} : \overline{\mathcal{M}} \rightarrow \Xi_h^{\mu, \lambda}(d)$ is topologically trivial. Moreover any two fibers of $\tilde{\pi}$ have isomorphic cohomology, and the mixed Hodge structure of the cohomology is pure.

Sketch of proof.

$$\begin{array}{ccc} U/\mathbb{R}^\times & \xrightarrow{(ii)} & \Xi_h^{\mu, \lambda}(d) \\ \downarrow (i) & & \parallel \\ \overline{\mathcal{M}} & \xrightarrow{\tilde{\pi}} & \Xi_h^{\mu, \lambda}(d), \end{array}$$

where (i) is a $U(1)$ -bundle, and (ii) is topologically trivial. Then, we obtain $\tilde{\pi}$ is topologically trivial.

Note that

$$\overline{\mathcal{M}} \setminus \mathcal{M} = \{ \mathbb{C}^\times \cdot (E, \nabla, \{\xi_j^i\}), 0, (\lambda, \xi) \} \Big|_{t \rightarrow \infty} \lim t \cdot (E, \nabla, \{\xi_j^i\}) \text{ exists}$$

is trivial over $\Xi_h^{\mu, \lambda}(d)$. Then we can show that any fibers of $\tilde{\pi}$ have isomorphic cohomology; in particular, $H^*(\mathcal{M}_{\text{Hod}, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}) \cong H^*(\mathcal{M}_{D, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d})$ for all $(\lambda, \xi) \in \Xi_h^{\mu, \lambda}(d)$.

Since $\mathcal{M}_{D, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$ is a proper orbifold (in particular a rational homology manifold), its cohomology has pure mixed Hodge structure. By standard Morse theory arguments, $H^*(\mathcal{M}_{D, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}) \rightarrow H^*(\mathcal{M}_{D, \text{GL}(n, \mathbb{C})}^{\mu, 0, g, d})$ is surjective. Thus, $H^*(\mathcal{M}_{D, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d})$ also has pure mixed Hodge structure. \square

Character variety

We now construct a variety, called character variety, whose points parametrize representation of the fundamental group of k -punctured Riemann surface of genus g into $\text{GL}(n, \mathbb{C})$ with prescribed images in semi-simple conjugacy classes C_1, \dots, C_k at the puncture. Assume that

$$\prod_{i=1}^k \det C_i = 1$$

and that (C_1, \dots, C_k) has type $\mu = (\mu^1, \dots, \mu^k)$; that is, C_i has type μ^i for each $i = 1, \dots, k$, where the type of a semi-simple conjugacy class $C_i \subset \text{GL}(n, \mathbb{C})$ is defined as the partition $\mu^i = (\mu_1^i, \dots, \mu_{r_i}^i)$ describing the multiplicities of the eigenvalues of any matrix in C_i .

Character Variety

For a k -tuple of conjugacy classes (C_1, \dots, C_k) of type μ ,

$$\begin{aligned} \mathcal{U}_{\text{GL}(n, \mathbb{C})}^{\mu, \lambda, g} &:= \{(A_1, B_1, \dots, A_g, B_g, X_1, \dots, X_k) \in \text{GL}(n, \mathbb{C})^{2g} \times \prod_{i=1}^k C_i \\ &\mid [A_1, B_1] \cdots [A_g, B_g] X_1 \cdots X_k = Id\}. \end{aligned}$$

We call the affine GIT quotient by conjugation

$$\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g} := \mathcal{U}_{\text{GL}(n, \mathbb{C})}^{\mu, \lambda, g} // \text{PGL}(n, \mathbb{C}) = \text{Spec}(\mathbb{C}[\mathcal{U}_{\text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}])^{\text{PGL}(n, \mathbb{C})}$$

a character variety of type μ .

If (C_1, \dots, C_k) is a generic k -tuple of semi-simple conjugacy classes in $\text{GL}(n, \mathbb{C})$ of type μ , then the quotient $\pi_\mu : \mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g} \rightarrow \mathcal{U}_{\text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}$ is a principal $\text{PGL}(n, \mathbb{C})$ -bundle. Consequently, when nonempty, the affine variety $\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}$ is nonsingular.

Riemann-Hilbert correspondence

For each member $(E, \nabla, \{\xi_j^i\}) \in \mathcal{M}_{D, R, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, \xi, g, d}$, $\text{Ker}(\nabla^n|_{\Sigma_0})$ becomes a local system on Σ_0 , where ∇^n means the analytic connection corresponding to ∇ . The local system $\text{Ker}(\nabla^n|_{\Sigma_0})$ corresponds to a representation of $\pi_1(\Sigma_0)$. Then, we obtain an analytic isomorphism

$$\text{RH}_\xi : \mathcal{M}_{D, R, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, \xi, g, d} \rightarrow \mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g, d}$$

where $\lambda_j^i = \exp(-2\pi\sqrt{-1}\xi_j^i)$ and we take ξ generic, that is, parabolic connections and local systems are irreducible.

We consider the family $\{\text{RH}_\xi\}$ over the locus of generic elements in $\Xi_h^{\mu, \lambda=1, k}(d)$, then we obtain the following theorem by Theorem 1,

Theorem 2

The mixed Hodge structure of the cohomology of $\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}$ is independent of the choice of generic eigenvalues of multiplicities μ .

Mixed Hodge structure of character varieties

We consider the cohomology of $\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}$. Since $\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g} \cong (\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g} \times (\mathbb{C}^\times)^{2g})/i_{\mathbb{C}^\times}^{2g}$, where $i_n = \{(e^{2\pi\sqrt{-1}d/n} I_n, e^{-2\pi\sqrt{-1}d/n}) \mid d = 1, \dots, n\}$, we obtain that

$$H^*(\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}) \cong H^*(\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g})^{i_{\mathbb{C}^\times}^{2g}} \oplus H^*((\mathbb{C}^\times)^{2g}).$$

Construction of generators of $H^*(\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g})^{i_{\mathbb{C}^\times}^{2g}}$

(I) $\text{PGL}(n, \mathbb{C})$ -principal bundle on $\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g} \times \Sigma_0$:

$$\mathcal{U} := (\text{PGL}(n, \mathbb{C}) \times \mathcal{U}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g} \times \tilde{\Sigma}_0)/(\pi_1(\Sigma_0) \times \text{GL}(n, \mathbb{C})),$$

where $\tilde{\Sigma}_0$ is the universal covering of Σ_0 and the action is $(p, g) \cdot (h, \rho, x) = (g\rho(p)h, g^{-1}\rho, p \cdot x)$. The characteristic classes:

$$\tilde{\alpha}_i(\mathcal{U}) = \beta_i + \sum_{j=1}^{2g} \gamma_{i,j} \epsilon_j + \sum_{k=1}^n \delta_{i,k} f_k \quad (i = 2, \dots, n),$$

$\beta_i \in H^{2i}(\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g})$, $\gamma_{i,j}, \delta_{i,k} \in H^{2i-1}(\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g})$.

(II) Let $b_i \in C^{2i-1}(G \times_G BG)$ be a singular cochain complex ($G = \text{SL}(n, \mathbb{C})$) such that $j^*(b_i) = 0$, where j is the inclusion $BG \rightarrow G \times_G EG$ as $\{e\} \times_G EG$, and generate the cohomology of the fiber G of fibration $G \times_G EG \rightarrow G$ as a ring. For

$$\Phi^G : G^{2g} \times \prod_{i=1}^k C_i \rightarrow G$$

$$(A_1, B_1, \dots, A_g, B_g, X_1, \dots, X_k) \mapsto [A_1, B_1] \cdots [A_g, B_g] X_1 \cdots X_k,$$

we can show that $\Phi^{G^*}(b_i) = 0$ in $H_G^{2i-1}(G^{2g} \times \prod_i C_i)$. We take $a_i \in C^{2i-2}(G^{2g} \times \prod_i C_i \times_G EG)$ such that $da_i = \Phi^{G^*}(b_i)$. Then,

$$\alpha_i := [a_i]_{\mathcal{U}_G^{2g}} \in H_G^{2i-2}(\mathcal{U}_G^{2g}) \cong H^{2i-2}(\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, g}).$$

(III) We fix diagonal matrices D_1, \dots, D_k in each conjugacy classes C_1, \dots, C_k .

$$\text{GL}(n, \mathbb{C})/H_i \rightarrow C_i \quad [g] \mapsto g^{-1} D_i g,$$

where $H_i = \text{GL}(\mu_1^i, \mathbb{C}) \otimes \dots \otimes \text{GL}(\mu_{r_i}^i, \mathbb{C})$. ($\mu_1^i + \dots + \mu_{r_i}^i = n$: the multiplicities of the eigenvalues of any matrix in C_i). For a conjugacy class C_i ,

$$\begin{aligned} \mathcal{U}_{\text{SL}(n, \mathbb{C})}^{\mu, \lambda, g, l} &:= \{(A_1, B_1, \dots, A_g, B_g, X_1, \dots, X_k) \\ &\in \text{SL}(n, \mathbb{C})^{2g} \times \prod_{j=1}^{2g} C_j \times \text{GL}(n, \mathbb{C}) \times \prod_{j=1}^k C_j \\ &\mid \prod_{i=1}^g [A_i, B_i] X_1 \cdots M_{i-1}^{-1} D_i M_i \cdots X_k = I_n\}. \end{aligned}$$

A natural map

$$\mathcal{U}_{\text{SL}(n, \mathbb{C})}^{\mu, \lambda, g, l} \rightarrow \mathcal{U}_{\text{SL}(n, \mathbb{C})}^{\mu, \lambda, g} \quad (\dots, M_i, \dots) \mapsto (\dots, M_i^{-1} D_i M_i, \dots).$$

We put $\mathcal{U}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g, l} := \mathcal{U}_{\text{SL}(n, \mathbb{C})}^{\mu, \lambda, g, l} // \text{PGL}(n, \mathbb{C})$ by a natural $\text{PGL}(n, \mathbb{C})$ -action, which is a H_1 -principal bundle on $\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g}$. we consider the classifying map,

$$\begin{aligned} \mathcal{U}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g, l} &\downarrow \\ \mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g} &\xrightarrow{f} B H_1 \cong B \text{GL}(\mu_1^1, \mathbb{C}) \times \dots \times B \text{GL}(\mu_{r_1}^1, \mathbb{C}). \end{aligned}$$

The characteristic classes

$$c_{k_1, \dots, k_{r_1}}^l := f^*(c_{k_1} \otimes \dots \otimes c_{k_{r_1}}) \quad (0 \leq k_j \leq \mu_j^1),$$

where $c_{k_j} \in H^{2k_j}(B \text{GL}(\mu_j^1, \mathbb{C}))$ and $c_0 := 1$.

Theorem 3

The classes $\alpha_i, \beta_i, \gamma_{i,j}$ and $c_{k_1, \dots, k_{r_1}}^l$ generate $H^*(\mathcal{M}_{B, \text{SL}(n, \mathbb{C})}^{\mu, \lambda, g})^{i_{\mathbb{C}^\times}^{2g}}$.

The generators $\alpha_i, \beta_i, \gamma_{i,j}$ (resp. $c_{k_1, \dots, k_{r_1}}^l$) have homogeneous weight i (resp. $k_1 + \dots + k_{r_1}$). On the other hand, generators of $H^*((\mathbb{C}^\times)^{2g})$ have also homogeneous weight. Then,

Theorem 4

The cohomology of $\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, k}$ is type (p, p) i.e. $\dim_{\mathbb{C}} G_{r,p}^F G_{i,p+q}^W H^j(\mathcal{M}_{B, \text{GL}(n, \mathbb{C})}^{\mu, \lambda, k}) = 0$ unless $p = q$.
