(26-5) HOUSEHOLD ACCOUNTS OF THE SAMPLE FARM (DD 1983)

NOMA, Haruo

The following ten tables show monthly gross cash income and expenditure for eight months of five sample households. The sample households are the same as the daily activity survey of 1983 that were reported in the second interim report. They are abbreviated here as KC, BP, BD, BC and PC. They were requested to keep their own daily accounts of cash income and expenditure for the period from 13 July 1983 till 13 March the following year. The survey period covers exactly 8 months, but note that starting and ending months have less than 30 days.

The gross income was calculated for both agricultural and non-agricultural sectors. The agricultural sector was divided into six main items with agricultural products in them broken down further into 4 sub-items. The non-agricultural sector has 7 items. On the other hand, gross expenditure was summed up to 14 items. As for foods and beverages in them, they were broken down further into 10 sub-items including rice, fish, meat, egg, etc.

A glance at these tables gives us a preliminary information that households KC, BP and BD are more self-sufficient and have less seasonal variation of income as well as expenditure as compared with the other two.

Detailed analysis of household economy will still have to be made with more information on proper evaluation of goods they self-supplied, self-consumed, and obtained through exchange.
