Explanation of Plate XXIII

Figs. 1-4 ×50

The following data are added next to Fig. 4 (Refer to the footnote on page 26).

Locality : Pontoli, Wontan-myon.

Horizon : Godō bed, Taishiin Series.

For convenience' sake of printing, the Lower and the Upper Jidō Series are shown in one colour on the geological map.

ERRATA (continued)

Studies on the Geologic Structure of the Phyongyang Coal Field

II Geologic Map

- (a) All the geological boundaries of the beresite masses along the Mukakusan and the Ryûsei thrusts should be drawn in thin broken line, though they are erroneously expressed by thick lines at the following places:
- (1) 2 mm north of the line of latitude 39° 0',
 - (2) 16 mm east of the line of longitude 125° 30',
 - (3) 11 mm east of the line of longitude 125° 30'.
- (b) The part of the geologic map, close to the lower margin near longitude 126° 0' should be read as shown in the following map (Fig. 1).
- (c) The Daidô-Heian boundary at 8.5 cm from the left on the profil VII should be read as shown in the following figure (Fig. 2).
- (d) In the Legend of the Geologic Map, for Basal quartzite of the Chokken read Quartzite (mainly basal) of the Chokken.
