# Injective hulls of bi $S$-sets 

Kunitaka Shoif<br>Department of Mathematics, Shimane University<br>Matsue, Shimane, 690-8504 Japan

In this paper, we study the injective hull of bi $S$-sets. In particular, we discuss descriptions of the injective hull of bi $S$-sets.

## 1 Injective hulls of bi $S$-sets

Let $S$ be a semigroup and $S^{1}$ a semigroup $S$ adjoined with an identity element.
A set $M$ is a bi $S$-set $M$ if $M$ has associative operations of $S$ on both sides.
Let $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$ denote the set of all mappings $f: S^{1} \times S^{1} \rightarrow M$ is a $S$-biset as follows :
$(s f t)((a, b))=f((a s, t b))$ for all $a, b, s, t \in S$.
Define the map $\Phi: M \rightarrow \operatorname{Map}\left(S^{1} \times S^{1}, M\right)\left(m \longmapsto f_{m}\right)$, where $f_{m}((a, b))=a m b$ for all $a, b \in S$ and $m \in M$. Then $\Phi$ is an $S$-isomorphism and $M$ is identified with $\Phi(M)$ as bi $S$-sets.

A bi $S$-set $M$ is injective if for any $S$-homomorphism $\xi$ vof a bi $S$-set $A$ to $M$ and an injective $S$ homomorphism $\alpha$ of $A$ to a bi $S$-set $B$, there exists an $S$-homomorphism $\sigma$ of $B$ to $M$ with $\alpha \sigma=\xi$.

Result [1, Theorem 6]. $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$ is an injective bi $S$-set.
Let $M, N$ be bi $S$-sets such that $M$ is a bi $S$-subset of $N$. Then $M$ is large in $N$ if any congruence $\sigma$ of $N$ with the restriction of $\sigma$ to $M$ being the identity relation is the identity relation itself.

By Theorem 10 of [1], $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$ contains a maximal large bi $S$-set $I(M)$ of $M$. Then $I(M)$ is the injective hull of $M . I(M)$ is a retraction of $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$. Actually, there exists an $S$-homomorphism $\alpha$ of $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$ to $I(M)$ with the restriction of $\alpha$ to $I(M)$ is an identity map of $I(M)$. In other words, there exists a congruence $\xi$ on $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$ such that $\operatorname{Map}\left(S^{1} \times S^{1}, M\right) / \xi$ is $S$-isomorhic to $I(M)$ and the restriction of $\xi$ to $M$ is the identity relation of $M$.

Here we consider a description of $\xi$.
Define a relation $\xi^{\prime}$ on $\operatorname{Map}\left(S^{1} \times S^{1}, M\right)$ as follows :
$f \xi^{\prime} g$ if and only if (i) $I_{f}=\left\{(s, t) \in S^{1} \times S^{1} \mid s f t \in M\right\}$ and $I_{g}$ are equal to each other and (ii) for any $(s, t) \in I_{f}=I_{g}, s f t=s g t$.

Then $\xi^{\prime}$ is a congruence and the restriction of $\xi_{M}$ of $\xi$ to $M$ is the identity relation. In particular, the set $\left\{f \in \operatorname{Map}\left(S^{1} \times S^{1}, M\right) \mid I_{f}\right.$ is empty $\}$ is a single $\xi^{\prime}$-class and is dented by $O$.

If $M$ does not contain any element $m$ with $S m S=\{m\}$, then $O$ is a single $\xi$-class. $O \cup M$ is a large extension of $M$.
Suppose that $M$ contains an element $m$ with $S m S=\{m\}$. Let $\xi^{\prime \prime}=\xi^{\prime} \cup\{(m, x),(x, m) \mid x \in O\}$. Then $\xi^{\prime \prime}$ is a congruence and $\xi^{\prime} \subset \xi^{\prime \prime} \subseteq \xi$.

Example Let $X=\{1,2\}$. Then $\mathcal{T}(X)=\left\{x=\left(\begin{array}{ll}1 & 2 \\ 1 & 1\end{array}\right), y=\left(\begin{array}{ll}1 & 2 \\ 2 & 2\end{array}\right), 1=\left(\begin{array}{ll}1 & 2 \\ 1 & 2\end{array}\right), g=\left(\begin{array}{ll}1 & 2 \\ 2 & 1\end{array}\right)\right\}$.
We use notation $\mathcal{T}_{2}$ in stead of $\mathcal{T}(\{1,2\})$.
Then for any $f \in \operatorname{Map}\left(\mathcal{T}_{2} \times \mathcal{T}_{2}, \mathcal{T}_{2}\right)$ and $s \in \mathcal{T}_{2}$, we have the following (1), (2) :
(1) $x f s \in \mathcal{T}_{2}\left[y f s \in \mathcal{T}_{2}\right]$ implies $x f s=x[y f s=y]$.
(2) if $f x \in \mathcal{T}_{2}\left[y f s \in \mathcal{T}_{2}\right]$ then $f x=x$ or $f x=y[f y=x$ or $f y=y]$.

Let $f, h \in \operatorname{Map}\left(\mathcal{T}_{2} \times \mathcal{T}_{2}, \mathcal{T}_{2}\right)$ with $f y=x, x f \notin \mathcal{T}_{2}$ and $x h=x$, hy $=x$. Then $(f, h) \notin \xi^{\prime}$ but by Theorem 7 of [1] and (i), (ii), $(f, h) \in \xi$.

Consequently, we conclude that $\xi^{\prime \prime}$ is properly contained in $\xi$.
We will continue to study the congruence $\xi$ in a subsequent paper.
