Kyoto University
The standard \((g, K)\)-modules for \(Sp(2, \mathbb{R})\), II
Takayuki ODA, the Univ. of Tokyo (東京大学数理科学 織田孝幸)

Abstract
As a continuation of the previous article [?], we continue the description of the standard \((g, K)\)-module structure of \(Sp(2, \mathbb{R})\).

Here we give a complete description of the generalized principal series associated with the parabolic subgroup \(P_J\) corresponding to the long root (we refer to such representations as the \(P_J\) principal series).

序

前回のノート [?] で、最も大きな主系列、つまり極小放物部分群から誘導される主系列表現の \((g, K)\)-加群を完全に明示的に記述した。注目すべきは、結果を \(K\) の canonical basis (あるいは crystal basis) で記述するとき、shift operators \((p_\pm\) に関する gradient operators からなる微分作用素行列) や固有値の行列 (the matrices of generalized infinitesimal characters) が tri-diagonal や di-diagonal になることである。

Harish-Chandra の subquotient theorem や Casselman の subrepresentation theorem によれば、任意の既約 \((g, K)\)-加群は主系列 \((g, K)\)-加群の (特殊化) の組成余群群である。加群として実現されるので、大まかに言えば、これで話は終わっている。しかし具体的なアルゴリズムとして、組成群や部分群の構造を完全に見えるのは、やや複雑ではない。例えば、既約 \((g, K)\)-加群 \(\pi\) を主系列 \(\Pi_\lambda\) に埋めることができ 

\((\pi \hookrightarrow \Pi_\lambda)\) 各 \(K\)-type \(\tau\) に対して \(\pi\) の中の \(\tau\)-等質成分 \((\tau\)-isotypic component) \(\pi[\tau]\) が \(\Pi_\lambda\) の \(\tau\)-等質成分 \(\Pi_\lambda[\tau]\) のどの一部に対応するのかは、双方の重複度が多ければ一般には明らかでない。この種のことを少なくとも \(G = Sp(2, \mathbb{R})\) のときに完全に記述するというのがこの企画の目標である。

ここでは長いルートに付随する放物部分群 \(P_J\) に関して誘導される表現 \(\pi\) を考える。この種の表現は Kostant-Vogan の意味で「大きい」 (large), つまりその Gelfand-Kirillov dimension は \(G = Sp(2, \mathbb{R})\) の極大ユニポテ
Introduction

In the previous note [?], we had an explicit description of the \((\mathfrak{g}, K)\)-module structures of the largest principal series, i.e., the principal series induced via the minimal parabolic subgroup \(P_0\). A notable fact is that in terms of the canonical basis (or the crystal basis) of the \(K\)-modules, the shift operators (the matrices of differential operators conming from the gradient operators with respect to \(p_\pm\)) and the matrices of eigenvalues (the generalized infinitesimal characters) are tri-diagonal, or di-diagonal.

By subquotient theorem of Harish-Chandra or by subrepresentation theorem of Casselman, any irreducible \((\mathfrak{g}, K)\)-module is realized as a subquotient or submodules of a (specialization of a) principal series \((\mathfrak{g}, K)\)-module. Therefore roughly speaking we have done the problem in the previous note [?]. However it is still difficult to grasp the structures of these subquotients and submodules, as concrete algorithm. For example, if we can embed an irreducible \((\mathfrak{g}, K)\)-module \(\pi\) into a principal series \(\Pi_\lambda (\pi \hookrightarrow \Pi_\lambda)\), it is not clear in general that for each \(K\)-type \(\tau\) how the \(\tau\)-isotypic component \(\pi[\tau]\) of \(\pi\) corresponds to a part of \(\tau\)-isotypic component \(\Pi_\lambda[\tau]\) of \(\Pi_\lambda\), when the multiplicities of both are big.

The target of our project is to fix this kind of problem completely explicitly, at least, for the \((\mathfrak{g}, K)\)-module strutures of \(Sp(2, \mathbb{R})\).

Here we consider the representations \(\pi\) obtained by parabolic induction with respect to the parabolic subgroup \(P_J\) associated with the long root. These representations are large in the sense of Kostant-Vogan, i.e., their Gelfand-Kirillov dimension is equal to \(\dim N\) of the maximal unipotent subgroup \(N\) of \(G = Sp(2, \mathbb{R})\). But the degree of the associated variety is 4, i.e., the half of the order of the Weyl group of \(G\).
1 The $P_J$-principal series

1.1 The parabolic subgroup $P_J$

The Lie algebra of the unipotent radical $N_J$ of the maximal parabolic subgroup $P_J$ associated with the subset $\{2e_2\}$ in the set $\{e_1 - e_2, 2e_2\}$ of simple roots of $Sp(2, \mathbb{R})$ is given by

$$n_J = \mathfrak{g}_{2e_1} \oplus \mathfrak{g}_{e_1-e_2} \oplus \mathfrak{g}_{e_1+e_2},$$

which is a Heisenberg algebra of dimension 3. We have

$$a_J = RH_1, \quad \text{with} \quad H_1 = E_{11} - E_{33},$$

and $A_J = \exp(a_J)$.

The Levi part of the maximal parabolic subgroup $P_J$ is given as a product $A_J M_J$ with

$$M_J = \left\{ \begin{pmatrix} \eta & a & b \\ \eta^{-1} & c & d \end{pmatrix} \mid \eta \in \mu_2 = \{\pm 1\}, \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL(2, \mathbb{R}) \right\},$$

which is isomorphic to a direct product $\mu_2 \times SL(2, \mathbb{R})$. The connected component $M_J^0$ of $M_J$ is isomorphic to $G_1 = SL(2, \mathbb{R})$.

We put $K_J := M_J \cap K$, then its connected component is given by $K_J^0 = M_J^0 \cap K$ which is isomorphic to

$$K_1 = \{ r_\theta = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \mid \theta \in \mathbb{R} \}$$

inside $G_1$.

1.2 Double coset decomposition for the $P_J$-principal series

For our later need, we want to have a decomposition of the standard basis $X_{\pm,ij}$ in $\mathfrak{p}_\pm$ with respect to

$$\text{Ad}^{-1}(n_{J,C} + m_{J,C}) + a_{J,C} + \xi_C$$
for a given regular element $a_J \in A_J$. Since $A_J$ centralizes $m_J$ and normalizes $n_J$, it suffices to know the following.

**Lemma J.1** We have

(i) $X_{\pm,11} = \pm 2\sqrt{-1}E_{2e_{1}} + H_1 \pm \kappa(e_{11})$

with

$$\pm 2\sqrt{-1}E_{2e_{1}} \in n_J, \quad H_1 \in a_J, \quad \kappa(e_{11}) \in \mathfrak{e}_C;$$

(ii) $X_{+,12} = E_{e_{1} - e_{2}} + \sqrt{-1}E_{e_{1} + e_{2}} + \kappa(e_{21});$

$X_{-,12} = E_{e_{1} - e_{2}} - \sqrt{-1}E_{e_{1} + e_{2}} - \kappa(e_{12})$

with

$$E_{e_{1} - e_{2}} \pm \sqrt{-1}E_{e_{1} + e_{2}} \in n_{J,C} \text{ and } \kappa(e_{21}), \kappa(e_{12}) \in \mathfrak{e}_C;$$

(iii) $X_{\pm,22} = (\pm 2\sqrt{-1}E_{2e_{2}} + H_2) \pm \kappa(e_{22})$

with

$$\pm 2\sqrt{-1}E_{2e_{2}} + H_2 \in m_J \text{ and } \kappa(e_{22}) \in \mathfrak{e}_C.$$

Moreover we note here that

$$\pm 2\sqrt{-1}E_{2e_{2}} + H_2 = H_2 \pm \sqrt{-1}(E_{2e_{2}} + \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}) \pm \sqrt{-1}(\begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix})$$

$$= x_\pm \pm \sqrt{-1}w,$$

with

$$x_\pm = H_2 \pm \sqrt{-1}(\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}) \text{ and } w = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}.$$

**1.3 Definition of the $P_J$-principal series**

The representation $\sigma_J \in \hat{M}_J$ is determined by a couple $\sigma_1 \in SL(2,\mathbb{R})$ and $\varepsilon \in \hat{\mu}_2$ as an outer tensor product $\sigma_J = \sigma_1 \otimes \varepsilon$. We assume that

$\sigma_1$ is a representation of discrete series of $SL(2,\mathbb{R})$. Hence $\sigma_1 = D_k^+$ or $D_k^-$ for some $k \geq 2$ ($k \in \mathbb{Z}$). Let $H_{D_k^\pm}$ be the representation of $D_k^+$ or of $D_k^-$, and denote by the same symbol its tensor product with the representation space $\mathbb{C}$ of $\varepsilon$ over $\mathbb{C}$. 
We fix a complex valued linear form $\nu_J$ on $a_J = \text{Lie}(A_J)$ and let $\rho_J$ be the half sum of roots belonging to $\mathfrak{n}_J$. The we consider a quasi-character

$$e^{\nu_J + \rho_J} : a_J \in A_J \mapsto \exp\{(\nu_J + \rho_J)(\log a_J)\} \in \mathbb{C}^\times.$$ 

Then the representation space $H_\pi$ of the representation

$$\pi = \pi_{P_J;\nu_J,\sigma_J} = \text{Ind}_{P_J}^G(\sigma_J \otimes e^{(\nu_J + \rho_J)} \otimes 1_{N_J})$$

of $P_J$ principal series, is given by

$$H_\pi := \{ f : G \to H_{D^\pm}, \text{ locally integrable} \}
\begin{aligned}
f(n_J m_J a_J x) &= \sigma_J(m_J) e^{(\nu_J + \rho_J)(\log a_J)} f(x) \\
\text{for a.e. } x \in G, n_J \in N_J, m_J \in M_J, a_J \in A_J \\
\int_K ||f(x)||_{H_{D^\pm}}^2 dx &< +\infty \}
\end{aligned}$$

The action of $G$ on this space is the right quasi-regular action given by

$$\pi(g) : f(x) \mapsto f(xg) \quad (x, g \in G, f \in H_\pi).$$

### 1.4 The $K$-types of $P_J$ principal series

We analyses the $K$-types of the representation space $H_\pi$ of a $P_J$ principal series. The target space of functions $f$ in $H_\pi$ has a decomposition:

$$H_{D^\pm} = \bigoplus_{a=0}^{\infty} \mathbb{C} v_{\pm(k+2a)}.$$ 

Denote the corresponding decomposition of $f$ by

$$f(x) = \sum_{a=0}^{\infty} f_{\pm(k+2a)}(x) v_{\pm(k+2a)}.$$ 

Let $x \in K$, and let $m_J \in K_J$ be given by

$$m_J = (\eta, r_\theta) \text{ with } r_\theta \in K_1 \text{ and } \eta \in \mu_2$$

with respect to the isomorphism $K_J \cong \mu_2 \times SO(2)$. Then the defining relation of $f$ reads

$$f(k_J x) = \sigma_J(m_J) f(x) = \epsilon(\eta) D^\pm_{k}(r_\theta) f(x) \quad (\text{a.e. } x \in K, k_J \in K_J).$$
The coefficients of $v_m$ in the left hand side and the right hand side of this equality are given by

$$f_m((\eta, r_\theta)x) \text{ and } f_m(x)\varepsilon^{im\theta},$$

respectively.

Therefore $f_m$ belongs to

$$L_{(K, \varepsilon \otimes \chi_m)}^2(K) := \{ f : G \to \mathbb{C}, \text{ locally integrable } \}
\begin{align*}
f(k_Jx) &= \varepsilon(\eta)\chi_m(r_\theta)f(x) \\
\text{for a.e. } x \in K, k_J = (\eta, r_\theta) \in K_J, \\
\int_K |f|K(x)|^2 dx < +\infty
\end{align*}$$

for each $m = \pm(k + 2a)$.

We recall here the equality of inner products:

$$\int_K \|f|K(x)|^2_{H_{D_k}} dx = \sum_m \{ \int_K |f|K(x)|^2 dx \} \|v_m\|_{H_{D_k}}^2.$$

**Proposition J.2** By restriction to $K$, we have an identification of spaces:

$$H_\pi = \bigoplus_{a=0}^{\infty} \{ L_{(K, \varepsilon \otimes \chi_{\pm(k+2a)})}^2(K) \otimes v_{\pm(k+2a)} \}.$$

**1.5 Construction of elementary functions**

We construct elementary functions in

$$H_\pi = \bigoplus_{a=0}^{\infty} \{ L_{(K, \varepsilon \otimes \chi_{\pm(k+2a)})}^2(K) \otimes v_{\pm(k+2a)} \}.$$  

First task is to construct elementary functions in each factor $L_{(K, \varepsilon \otimes \chi_{\pm m})}^2(K)$ for each $m = k + 2a$.

**Lemma J.3** The irreducible decomposition of $K \times K$ bimodule $L^2(K)$ induces an isomorphism of $K$-modules:

$$L_{(K, \varepsilon \otimes \chi_{\pm m})}^2(K) = \bigoplus_{\tau \in \hat{K}} \{ (\tau^*|K_J)[\varepsilon \otimes \chi_{\pm m}] \boxtimes \tau \}
\begin{align*}
&= \bigoplus_{(l_1, l_2) \in L} \{ (\tau^*|K_J)[\varepsilon \otimes \chi_{\pm m}] \boxtimes \tau_{(l_1, l_2)} \}
\end{align*}$$

Here $\tau^*$ is the contragradient representation of $\tau$ and $(\tau^*|K_J)[\varepsilon \otimes \chi_{m}]$ is the $\varepsilon \otimes \chi_m$-isotypic component in the $K_J$ module $\tau^*|K_J$.
Proof. By definition, $L^2_{(K^r,\epsilon\otimes\chi\pm m)}(K) = \{ C(\epsilon\otimes\chi_m) \otimes L^2(K) \}^{K_J}$. Apply the decomposition of the $K \times K$-bimodules:

$$L^2(K) = \bigoplus_{(l_1,l_2)\in L} \tau_{(l_1,l_2)}^* \otimes \tau_{(l_1,l_2)}.$$ 

Since the operation to take the invariant part with respect to $K_J$ is involving only the first factor $\tau_{(l_1,l_2)}$ of each $\tau_{(l_1,l_2)}$-isotypic component, we have our proposition. □

Now we have to construct elementary functions in

$$\langle \tau_{(l_1,l_2)}^* \otimes \tau_{(l_1,l_2)} \mid \epsilon \otimes \chi_{\pm m} \rangle \otimes \tau_{(l_1,l_2)}.$$ 

The larger space $\tau_{(l_1,l_2)}^* \otimes \tau_{(l_1,l_2)}$ in $L^2(K)$ is generated by the entries in the matrix $\text{Sym}^d(S(x)) \det(S(x))^{l_2}$ ($x \in K, d = l_1 - l_2$). To see their intertwining properties with respect to the restriction to $K_J$ of the left regular representation of $K$, we compute $\text{Sym}^d(S(y)) \det(S(y))^{l_2}$ for $y \in K_J$ given by

$$y = (\eta, r_\theta) \in \mu_2 \times \text{SO}(2),$$

which corresponds to $\begin{pmatrix} \eta & 0 \\ 0 & e^{i\theta} \end{pmatrix}$ in $U(2)$.

Fortunately $\text{Sym}^d(S(y)) \det(S(y))^{l_2}$ ($y \in K_J$) is diagonalized as

$$\text{diag}(\eta^d, \eta^{d-1}e^{i\theta}, \ldots, \eta^{l_1-1}e^{i(l_2+1)\theta}, \ldots, \eta^{l_2}e^{i(l_1-1)\theta}).$$

Therefore the eigenspace of $\epsilon \otimes \chi_{\pm m}(y) = \epsilon(\eta)e^{\pm im\theta}$ occurs with multiplicity one, if there exists $a \in \mathbb{Z}$ ($0 \leq a \leq d$) such that

$$\eta^{l_1-a}e^{i(l_2+a)\theta} = \epsilon(\eta)e^{\pm im\theta} \text{ for any } \eta \in \mu_2, \theta \in \mathbb{R}.$$ 

In this case, the eigenspace is generated by the $(d+1)$ entries the $(a+1)$-th row vector of the matrix $\text{Sym}^d(S(x)) \det(S(x))^{l_2}$ ($x \in K$). Thus we have the following.

**Proposition J.4** The $\tau_{(l_1,l_2)}$-isotypic component of $L^2_{(K^r,\epsilon\otimes\chi\pm m)}(K)$ is given by

$$L^2_{(K^r,\epsilon\otimes\chi\pm m)}(K)(\tau_{(l_1,l_2)}) = C \langle s_{m-l_2}^{(d)} \Delta^{l_2} \rangle.$$
if
\[ l_2 \leq \pm m \leq l_1 \]
and
\[ \epsilon(\eta) = \eta^{d \pm m} \]
for any \( \eta \in \mu_2 \).

Otherwise, it is \( \{0\} \).

**Corollary J.5** The natural surjection:

\[
\bigoplus_{a=0}^{\infty} L^2(K, \epsilon \otimes \chi \otimes \chi^{(k+2a)}) (K) v_{\pm(k+2a)} \to \left\{ \sum_{a=0}^{\infty} L^2(K, \epsilon \otimes \chi \otimes \chi^{(k+2a)}) (K) \right\} \subset L^2(K)
\]

is an isomorphism.

**Proof.** This is obvious from the above construction of elementary functions.

**Definition** Let \( \epsilon \in \mu_2 \) and \( k \in \mathbb{Z}_{\geq 2} \). Then we put

\[
M(p, m; (l_1, l_2)) := \{ a \in \mathbb{Z}_{\geq 0} | l_2 \leq \pm(k+2a) \leq l_1, \ \text{parity}(\epsilon) \equiv l_1 - l_2 + k \mod 2 \}
\]

**Proposition J.6** The \( \tau(l_1, l_2) \)-isotypic component in \( H_\pi = H_{\pi_{P,J, \nu, \sigma}} \) has a system of canonical basis consisting of vectors of elementary functions:

\[
\{ s_{\pm(k+2a)}^{(l_1-l_2)} \Delta^{l_2} | a \in M_{\pm}(\epsilon, k; (l_1, l_2)) \}.
\]

In particular, the multiplicity of \( \tau(l_1, l_2) \) in \( H_\pi \) is given by the cardinality

\[
m(\pm; \epsilon, k; (l_1, l_2)) = \#M_{\pm}(\epsilon, k; (l_1, l_2))
\]

of the set \( M_{\pm}(\epsilon, k; (l_1, l_2)) \).

From now on, we consider only the + sign in \( \pm \). Therefore, the symbols \( m(\pm; \epsilon, k; (l_1, l_2)) \) and \( M_{\pm}(\epsilon, k; (l_1, l_2)) \) are abridged to \( m(\epsilon, k; (l_1, l_2)) \) and \( M(\epsilon, k; (l_1, l_2)) \), respectively.

In order to formulate the corollary of the above proposition, we have to some notation.

**Notation** (parity function and positive part)

(i) For \( l \in \mathbb{Z} \), we define \( p_k(l) \) by

\[
p_k(l) := \begin{cases} 0, & \text{if } l \equiv k \text{ mod } 2; \\ 1, & \text{if } l \not\equiv k \text{ mod } 2. \end{cases}
\]
(ii) For any function $f(l_1, l_2, k)$ in $(l_1, l_2, k)$, we associate another function $f(l_1, l_2, k)_+$ by

$$ f(l_1, l_2, k)_+ := \sup\{0, f(l_1, l_2, k)\}. $$

**Corollary J.7** The multiplicity $m(l_1, l_2)$ of $\tau(l_1, l_2)$ in the principal series representation $\pi = \pi_{P_J, \nu_J, \sigma_J}$ is given as

$$ m(l_1, l_2) = \frac{1}{2}\{l_1 + 2 - p_k(l_1) - k\}_+ - \frac{1}{2}\{l_2 + p_k(l_2) - k\}_+ $$

$$ = \frac{1}{2}(\sup\{l_1 - p_k(l_1), k\} - \sup\{l_2 + p_k(l_2), k\}) + 1. $$

## 2 Contiguous Relations for the $P_J$-principal series

### 2.1 Contiguous relations along the peripheral $K$-types

We investigate the $(\mathfrak{g}, K)$-module structure on the subspace

$$ L^2_{(K_J, \epsilon \otimes \mathfrak{h})} v_k \subset H_{(P_J, \nu_J, D^+_k \otimes \epsilon)} $$

Inside this subspace there occurs $K$-types:

$$ \begin{cases} 
\tau(k, k-2a)(a = 0, 1, \ldots) & \text{for even case;} \\
\tau(k, k-2a-1)(a = 0, 1, \ldots) & \text{for odd cases}
\end{cases} $$

with multiplicity one. Moreover each $\tau(k, k-\star)$-isotopic component is given

$$ \begin{cases} 
either by & \langle s_{2a}^{(2a)} \Delta^{k-2a} \rangle v_k \\
or by & \langle s_{2a+1}^{2a+1} \Delta^{k-2a-1} \rangle v_k
\end{cases} $$

respectively.

**Proposition J.8** (contiguous equations) We drop the generator $v_k$ here.

(i) When $(-1)^k = \epsilon$ (i.e., the even case), we have the going-down contiguous equation

$$ C^{(2a)}_{-(+2)} \{s_{2a}^{(2a)} \Delta^{k-2a}\} = \{s_{2a+2}^{(2a+2)} \Delta^{k-2a-2}\}^* \gamma^{(2a)}_{-(+2)} $$
with \( \gamma_{-, (+2)}^{(2a)} = \nu_J + \rho_J - k + 2a \), and the going-up equation

\[
C_{+, (-2)}^{(2a)} \{ s_{2a}^{(2a)} \Delta^{k-2a} \} = \{ s_{2a-2}^{(2a-2)} \Delta^{k-2a+2} \} \gamma_{+, (-2)}^{(2a)}
\]

with \( \gamma_{+, (-2)}^{(2a)} = \nu_J + \rho_J + k - 2a - 2 \).

(ii) When \((-1)^k = -\epsilon\) (the odd case), we have

\[
C_{-, (+2)}^{(2a+1)} \{ s_{2a+1}^{(2a+1)} \Delta^{k-2a-1} \} = \{ s_{2a+3}^{(2a+3)} \Delta^{k-2a-3} \} \gamma_{-, (+2)}^{(2a+1)}
\]

with the intertwining constant \( \gamma_{-, (+2)}^{(2a+1)} = \nu_J + \rho_J - k + 2a + 1 \), and

\[
C_{+, (-2)}^{(2a+1)} \{ s_{2a+1}^{(2a+1)} \Delta^{k-2a-1} \} = \{ s_{2a-1}^{(2a-1)} \Delta^{k-2a+1} \} \gamma_{+, (-2)}^{(2a+1)} \) (odd case)

with the constant \( \gamma_{+, (-2)}^{(2a+1)} = \nu_J + \rho_J + k - 2a - 3 \).

**Proof.** (Going-down equations) Set \( d = 2a \) or \( d = 2a + 1 \), respectively. Since the value of \( s_{d+2}^{(d+2)} \Delta^{k-d-2} \) at \( e \) is the column vector \( (0, \cdots, 0, 1) \), it suffices to compute the value at \( e \) of \( C_{-, (+2)}^{(d)} s_{d}^{(d)} \Delta^{k-d} \). The last row of \( C_{-, (+2)}^{(d)} \) is given by

\[
(0, \cdots, 0, X_{-11}).
\]

Therefore, utilizing the double coset decomposition

\[
X_{-11} = -2\sqrt{-1}E_{2e_1} + H_1 - \tau(e_{11}),
\]

we have to compute the value

\[
X_{-11}(s_{22}^{d} \Delta^{k-d})(e)v_k = \{ H_1(s_{22}^{d} \Delta^{k-d})(e) - \tau(e_{11})(s_{22}^{d} \Delta^{k-d})(e) \} = \{ \nu_J + \rho_J - (k - d) \} v_k.
\]

(Going-up equations) Put \( d = 2a \) or \( d = 2a + 1 \). Then we have to compute the constant \( \gamma_{+, (-2)}^{(2a+1)} \) in

\[
C_{+, (-2)}^{(d)} s_{d}^{(d)} \Delta^{k-d} = \gamma_{+, (-2)}^{(2a+1)} s_{d-2}^{(d-2)} \Delta^{k-d+2}.
\]

Since the last row of the operator \( C_{+, (-2)}^{(d)} \) is

\[
(0, \cdots, 0, X_{+22}, -2X_{+12}, X_{+11}),
\]
we have to compute the sum of the three values
\[ X_{+22}(s_{21}^{2}s_{22}^{d-2}\Delta^{k-d})(e) = 0, \]
\[ -2X_{+12}(s_{21}s_{22}^{d-1}\Delta^{k-d})(e) = -2\kappa(e_{21})(s_{21}s_{22}^{d-1}\Delta^{k-d})(e) \]
\[ = -2(\Delta^{k-d})(e) = -2, \]
and
\[ X_{+11}(s_{22}^{d}\Delta^{k-d})(e) = (\nu_{J} + \rho_{J}) + (k - d). \]

Therefore \( \gamma_{+;(-2)}^{d} = \nu_{J} + \rho_{J} + (k - d) - 2. \) □

**Remark** (Comparison with the principal series) Let us specialize one of the parameters as \( \nu_{2} \mapsto k - 1, \) i.e. \( \nu_{2} + \rho_{2} = k \) in the even \( P_{\text{min}} \)-principal series \( \pi_{(P_{\text{min}};\nu_{1},\nu_{2},\epsilon_{1},\epsilon_{2})} \). Then its contiguous relation at the \( K \)-type \( \tau(k,k) \) \( (p_{-}-\text{side, going-down}) \) gives
\[
\begin{pmatrix}
X_{-22}(\Delta^{k}) \\
X_{-12}(\Delta^{k}) \\
X_{-11}(\Delta^{k})
\end{pmatrix} = (\nu_{1} + 2 - k) \begin{pmatrix}
s_{21}^{2}\Delta^{k-2} \\
s_{21}s_{22}\Delta^{k-2} \\
s_{22}^{2}\Delta^{k-2}
\end{pmatrix}
\]

This gives formally the same contiguous equation at \( \tau(k,k) \) of the even \( P_{J} \)-principal series, when we put \( \nu_{1} = \nu_{J} \). Needless to say, this corresponds to the existence of the embedding of the \( P_{J} \)-principal series to the \( P_{\text{min}} \)-principal series. We already use this fact substantially in former papers.

### 2.2 Contiguous relations for general \( K \)-types

Before to discuss the contiguous relations, we compare firstly the multiplicities between contiguous \( K \)-types, i.e., the multiplicities
\[ m(\epsilon,k;(l_{1}, l_{2})), \quad m(\epsilon,k;(l_{1}', l_{2}')) \]
when \( |l_{1}' - l_{1}| + |l_{2}' - l_{2}| = 2 \), but \( l_{1} + l_{2} \neq l_{1}' + l_{2}' \).

**Claim J.9** Set
\[ m = m(\epsilon,k;(l_{1}, l_{2})), \quad m' = m(\epsilon,k;(l_{1}', l_{2}')). \]
Then in the case of even principal series representations, we have the following:

For \((l_1', l_2') = (l_1 + 2, l_2)\), \(m' = m + 1\).

For \((l_1', l_2') = (l_1, l_2 + 2)\),
\[
m' = \begin{cases} 
m & \text{if } l_2 < k \\
m - 1, & \text{if } l_2 \geq k.
\end{cases}
\]

For \((l_1', l_2') = (l_1 + 1, l_2 + 1)\),
\[
m' = \begin{cases} 
m & \text{if } l_1 \equiv l_2 \equiv k \mod 2 \text{ and } l_2 \leq k - 2 \\
m + 1, & \text{if } l_1 \equiv l_2 \equiv k + 1 \mod 2.
\end{cases}
\]

For \((l_1', l_2') = (l_1 - 2, l_2)\), \(m' = m - 1\).

For \((l_1', l_2') = (l_1, l_2 - 2)\),
\[
m' = \begin{cases} 
m & \text{if } l_2 \leq k - 2 \\
m + 1, & \text{if } l_2 > k - 1.
\end{cases}
\]

In the case of odd principal series representations, we have

For \((l_1', l_2') = (l_1 + 2, l_2)\), \(m' = m + 1\).

For \((l_1', l_2') = (l_1, l_2 + 2)\),
\[
m' = \begin{cases} 
m & \text{if } l_1 \equiv l_2 \equiv k \mod 2 \text{ and } l_2 \geq k \\
m - 1, & \text{if } l_2 \leq k - 1.
\end{cases}
\]

For \((l_1', l_2') = (l_1 + 1, l_2 + 1)\),
\[
m' = \begin{cases} 
m & \text{if } l_1 \equiv l_2 \equiv k \mod 2 \text{ or } l_2 \geq k; \\
m + 1, & \text{if } l_1 \equiv k \mod 2 \text{ and } l_2 \leq k - 2.
\end{cases}
\]

For \((l_1', l_2') = (l_1 - 2, l_2)\), \(m' = m - 1\).

For \((l_1', l_2') = (l_1, l_2 - 2)\),
\[
m' = \begin{cases} 
m & \text{if } l_1 \equiv l_2 \equiv k \mod 2 \text{ or } l_2 \geq k \\
m + 1, & \text{if } l_2 \leq k + 1.
\end{cases}
\]

For \((l_1', l_2') = (l_1 - 1, l_2 - 1)\),
\[
m' = \begin{cases} 
m & \text{if } l_1 \equiv l_2 \equiv k \mod 2 \text{ or } l_2 \geq k \\
m - 1, & \text{if } l_1 \equiv k \mod 2 \text{ and } l_2 < k.
\end{cases}
\]

Now we have the canonical blocks of elementary functions, which are the source and target of the Dirac-Schmid operator considered in the section 1. Then we have the contiguous relations, if we determine the matrices of intertwining constants. To describe these results economically, we introduce more new symbols.
More local symbols  For a dominant weight \((l_1, l_2) \in L_T^+\), using the former 'local' symbols:

\[
    p_k(l_i) := \begin{cases} 
    0 & \text{if } l_i \equiv k \pmod{2} \\
    1 & \text{if } l_i \not\equiv k \pmod{2} 
    \end{cases} \quad (i = 1, 2)
\]

we set

\[
    \tilde{l}_1 = l_1 - p_k(l_1) \quad \text{and} \quad \tilde{l}_2 = l_2 + p_k(l_2).
\]

**Proposition J.10.A**

The case of even \(P_J\)-principal series \((-1)^k = \varepsilon\).

**Going-up relations:**

(i) If \(\tilde{l}_2 \leq k - 2\), we have

\[
    C_{+,i(-2)} s_{[k-l_2, \ldots, d-p_k(l_2)]}^{(d)} \Delta l_2 = s_{[k-l_2-2, \ldots, d-2-p_k(l_2)]}^{(d-2)} \Delta l_2 + 2 \cdot \Gamma_{+,i(-2)}(\pi_{P_J, k}; (l_1, l_2))
\]

with some \(\frac{1}{2}\{\tilde{l}_1 + 2 - k\} + \frac{1}{2}\{\tilde{l}_1 + 2 - k\}^+\) intertwining matrix \(\Gamma_{+,i(-2)}(\pi_{P_J, k}; (l_1, l_2))\) which is given by

\[
    \Gamma_{+,i(-2)}(\pi_{P_J, k}; (l_1, l_2)) = \begin{bmatrix} 0 & 0 \\
    \text{diag}_{\frac{1}{2}(k-l_2)+i \leq j \leq \frac{d}{2}-(k+l_2-2)}(j + \tilde{l}_2 - d + 2i) & \text{diag}_{\frac{1}{2}(k-l_2)+i \leq j \leq \frac{d}{2}-(k+l_2-2)}(j + \tilde{l}_2 - d + 2i) \end{bmatrix}.
\]

(ii) If \(\tilde{l}_2 \geq k\), we have

\[
    C_{+,i(-2)} s_{[0, \ldots, d-p_k(l_2)]}^{(d)} \Delta l_2 = s_{[0, \ldots, d-2-p_k(l_2)]}^{(d-2)} \Delta l_2 + 2 \cdot \Gamma_{+,i(-2)}(\pi_{P_J, k}; (l_1, l_2))
\]

with some \((\frac{d}{2} - p_k(l_1)) \times (\frac{d}{2} + 1 - p_k(l_1))\) matrix \(\Gamma_{+,i(-2)}(\pi_{P_J, k}; (l_1, l_2))\), given by

\[
    \Gamma_{+,i(-2)}(\pi_{P_J, k}; (l_1, l_2)) = \begin{bmatrix} \text{diag}_{0 \leq i \leq \frac{d}{2}-1-p_k(l_1)}(k + \tilde{l}_2 + 2i), 0 \\
    0, \text{ diag}_{0 \leq i \leq \frac{d}{2}-1-p_k(l_1)}(\nu_{J} + \rho_{J} + \tilde{l}_2 - d + 2i) \end{bmatrix}.
\]

**Slant-up relations:** \(C_{+,i(0)} : \tau(l_1,l_2) \rightarrow \tau(l_1+1,l_2+1)\) (3 cases)

(iii) If \(p_k(l_1) = p_k(l_2) = 0\) and \(l_2 \leq k - 2\), we have \(m' = m\) and

\[
    C_{+,i(0)} s_{[k-l_2, \ldots, d]}^{(d)} \Delta l_2 = s_{[k-l_2-1, \ldots, d-1]}^{(d)} \Delta l_2 + 1 \cdot \Gamma_{+,i(0)}(\pi_{P_J, k}; (l_1, l_2))
\]
with some $\frac{1}{2}\{l_1 + 2 - k\}_+ \times \frac{1}{2}\{l_1 + 2 - k\}_+$ intertwining matrix $\Gamma_{+:;\langle 0 \rangle}^{(\pi_{P_J,k}; (l_1, l_2))}$, which is given by

$$
\Gamma_{+:;\langle 0 \rangle}^{(\pi_{P_J,k}; (l_1, l_2))} = \begin{bmatrix}
0, & 0 \\

Going-down relations: \( C_{-;\pm 2} : \tau(l_1, l_2) \rightarrow \tau(l_1, l_2-2) \) (two cases)
(vi) When $\tilde{l}_2 \geq k + 2$, we have

$$C_{-;(+2)}s^{(d)}_{\{p_k(l_2), \ldots, d-2-p_k(l_2)\}}\Delta^{l_2} = s^{(d+2)}_{\{p_k(l_2), \ldots, d+2-p_k(l_2)\}}\Delta^{l_2-2}\Gamma_{-;(+)}(\pi_{P_J}; (l_1, l_2))$$

with some $\left(\frac{d}{2} - p_k(l_2)\right) \times \left(\frac{d}{2} + 1 - p_k(l_2)\right)$ intertwining matrix $\Gamma_{-;(+)}(\pi_{P_J}; (l_1, l_2))$, which is given by

$$\Gamma_{-;(+)}(\pi_{P_J}; (l_1, l_2)) = \begin{bmatrix} \text{diag}_{0 \leq i \leq \frac{d}{2} - p_k(l_2)} \left(\frac{(d+1-p_k(l_2)-2i)(d+2-p_k(l_2)-2i)}{(d+1)(d+2)}\right) (k - \tilde{l}_2 - 2i) \right) \\
0 \\
\text{diag}_{0 \leq i \leq \frac{d}{2} - p_k(l_2)} \left(\frac{(2i+1+p_k(l_2))(2i+2+p_k(l_2))}{(d+1)(d+2)}\right) (\nu_J + \rho_J - \tilde{l}_2 - 2i + d) \end{bmatrix}.$$ 

Next we discuss the case of odd $P_J$'s. We define the micro-parity of each $K$-type $\tau(l_1, l_2)$.

**Definition** If $((-1)^{l_1}, (-1)^{l_2}) = (\epsilon, \epsilon)$ (resp. $((-1)^{l_1}, (-1)^{l_2}) = (-\epsilon, \epsilon)$), we say that the micro-parity of $(l_1, l_2)$ is +1 (resp. -1) (or even (resp. odd)).

**Proposition J.10.B**

The case of odd $P_J$-principal series $((-1)^k = \epsilon)$. In this case only those $K$-types $\tau(l_1, l_2)$ such that $d = l_1 - l_2$ is odd occur.

**Going-up relations:** $C_{+;(-2)} : \tau(l_1, l_2) \rightarrow \tau(l_1, l_2+2)$ (two cases)

(i) If $\tilde{l}_2 \leq k - 2$, we have

$$C_{+;(-2)}s^{(d)}_{\{l_2, \ldots, d-p_k(l_1)\}}\Delta^{l_2} = s^{(d-2)}_{\{l_2-2, \ldots, d-2-p_k(l_1)\}}\Delta^{l_2+2}\Gamma_{+;(-2)}(\pi_{J}; (l_1, l_2))$$

with some $\frac{l_2-k}{2} \times \frac{l_2-k}{2}$ intertwining matrix $\Gamma_{+;(-2)}(\pi_{J}; (l_1, l_2))$, which is given by

$$\Gamma_{+;(-2)}(\pi_{J}; (l_1, l_2)) = \begin{bmatrix} \text{diag}_{\frac{1}{2}(k-l_2+2) \leq a \leq (d-3)/2} (k - \tilde{l}_2 + 2a) \left(\frac{(d+1-p_k(l_2)-2i)(d+2-p_k(l_2)-2i)}{(d+1)(d+2)}\right) (k - \tilde{l}_2 - 2i) \right) \\
0 \\
\text{diag}_{\frac{1}{2}(k-l_2+2) \leq a \leq (d-3)/2} (\nu_J + \rho_J + \tilde{l}_2 - d + 2a) \end{bmatrix}.$$ 

(ii) If $\tilde{l}_2 \geq k$, we have

$$C_{+;(-2)}s^{(d)}_{\{p_k(l_2), \ldots, d-p_k(l_1)\}}\Delta^{l_2} = s^{(d-2)}_{\{p_k(l_2), \ldots, d-2-p_k(l_1)\}}\Delta^{l_2+2}\Gamma_{+;(-2)}(\pi_{J}; (l_1, l_2))$$
with some \((\frac{d-1}{2}) \times (\frac{d+1}{2})\) intertwining matrix \(\Gamma_{+(0)}(\pi_{\mathfrak{J}}, k; (l_{1}, l_{2}))\), which is given by

\[
\Gamma_{+(0)}(l_{1}, l_{2}) = \begin{bmatrix}
& (\text{diag}_{0 \leq a \leq (d-3)/2}(k + \tilde{l}_{2} + 2a), 0) \\
& 0, \text{diag}_{0 \leq a \leq (d-3)/2}(\nu_{\mathfrak{J}} + \rho_{\mathfrak{J}} + l_{2} - d + 2a)
\end{bmatrix}.
\]

\textit{Slant-up relations:} \(C_{+(0)} : \tau(l_{1}, l_{2}) \rightarrow \tau(l_{1}+1, l_{2}+1)\) (3 cases)

(iii) If micro-parity is odd, we have \(m' = m\) and

\[
C_{+(0)} s_{\sup\{k-l_{2}, 1\}, \cdots, d}^{(d)} \Delta^{l_{2}} = s_{\sup\{k-l_{2}-1, 0\}, \cdots, d-1}^{(d)} \Delta^{l_{2}+1} \cdot \Gamma_{\pi_{\mathfrak{J}}, k}(l_{1}, l_{2})
\]

with some \(\frac{1}{2}(l_{1}-k+2) \times \frac{1}{2}(l_{1}-k+2)\) intertwining matrix \(\Gamma_{+(0);\pi_{\mathfrak{J}}, k}(l_{1}, l_{2})\), which is given by

\[
\Gamma_{+(0);10}(l_{1}, l_{2}) = \text{diag}_{\sup\{\frac{1}{2}(k-l_{2}-1), 0\} \leq a \leq \frac{d-1}{2}}(-\frac{2a+1}{d}(k + \rho_{2} + l_{2} + 2a))
\]

\[
+ \begin{bmatrix}
0, & 0 \\
\text{diag}_{\sup\{\frac{1}{2}(k-l_{2}+1), 1\} \leq a \leq \frac{d-3}{2}}(-\frac{2a}{d}(k + l_{2} + 2a - 1)), & 0
\end{bmatrix}.
\]

(iv) If the micro-parity of \((l_{1}, l_{2})\) is even, and \(l_{2} \geq k\), we have \(m' = m\) and

\[
C_{+(0)} s_{\sup\{k-l_{2}-1, 0\}, \cdots, d}^{(d)} \Delta^{l_{2}} = s_{\sup\{k-l_{2}-1, 0\}, \cdots, d-1}^{(d)} \Delta^{l_{2}+1} \cdot \Gamma_{+(0);\pi_{\mathfrak{J}}, k}(l_{1}, l_{2})
\]

with some \(\frac{d+1}{2} \times \frac{d+1}{2}\) intertwining matrix \(\Gamma\), which is given by

\[
\Gamma_{+(0);01}(l_{1}, l_{2}) = \text{diag}_{0 \leq a \leq \frac{d-1}{2}}(-\frac{2a+1}{d}(k + \rho_{2} + l_{2} + 2a))
\]

\[
+ \begin{bmatrix}
0, & 0 \\
\text{diag}_{0 \leq a \leq \frac{d-3}{2}}(-\frac{2a}{d}(k + l_{2} + 2a - 1)), & 0
\end{bmatrix}.
\]

(v) If the micro-parity of \((l_{1}, l_{2})\) is even and \(l_{2} \leq k-2\) we have \(m' = m+1\) and

\[
C_{+(0)} s_{\sup\{k-l_{2}, \cdots, d-1\}}^{(d)} \Delta^{l_{2}} = s_{\sup\{k-l_{2}-1, \cdots, d\}}^{(d)} \Delta^{l_{2}+1} \cdot \Gamma_{+(0);\pi_{\mathfrak{J}}, k}(l_{1}, l_{2})
\]

with some \(\frac{k-1}{2} \times \frac{k-1}{2}\) intertwining matrix \(\Gamma_{+(0);\pi_{\mathfrak{J}}, k}(l_{1}, l_{2})\), which is given by

\[
\Gamma_{+(0);01}(l_{1}, l_{2}) = \begin{bmatrix}
0 \\
\text{diag}_{\frac{k-l_{2}}{2} \leq a \leq \frac{d-1}{2}}(-\frac{2a+1}{d}(k + l_{2} + 2a))
\end{bmatrix}
\]

\[
+ \begin{bmatrix}
\text{diag}_{\frac{k-l_{2}}{2} \leq a \leq \frac{d-3}{2}}(-\frac{2a-1}{d}(\nu_{\mathfrak{J}} + \rho_{\mathfrak{J}} + l_{2} + 2a)), & 0
\end{bmatrix}.
\]
Going-right relations: $\mathcal{C}_{+;(\pm 2)}: \tau(l_1, l_2) \rightarrow \tau(l_1 \pm 2, l_2)$ (one case)

(vi) We have $m' = m + 1$ and

$$\mathcal{C}_{+;(\pm 2)}s_{\{\sup(k-l_2, p_k(l_2)), \ldots, d-p_k(l_1)\}}^{(d)} \Delta l_2 = s_{\{\sup(k-l_2, p_k(l_2)), \ldots, d+2-p_k(l_1)\}}^{(d)} \cdot \Gamma_{+;(+2)}(l_1, l_2)$$

with some $\left(\frac{l_1+2-\sup(k, l_2)}{2}\right) \times \left(\frac{l_1+4-\sup(k, l_2)}{2}\right)$ intertwining matrix $\Gamma_{+;(+2)}(l_1, l_2)$, which is given by

$$\Gamma_{+;(+2)}(l_1, l_2) = \begin{bmatrix} \text{diag} & \frac{\nu_J + \rho_J + \tilde{l}_2 + d + 2a}{d+1}(d+2) & 0 \\ 0 & \text{diag} & \frac{(\nu_J + \rho_J + \tilde{l}_2 + 2a)}{d+1}(d+2) \end{bmatrix}$$

Going-left relations: $\mathcal{C}_{-;(-2)}: \tau(l_1, l_2) \rightarrow \tau(l_1 - 2, l_2)$: (one case only)

(i) We have $m' = m - 1$ and

$$\mathcal{C}_{-;(-2)}s_{\{\sup(k-l_2, p_k(l_2)), \ldots, d-p_k(l_1)\}}^{(d)} \Delta l_1 = s_{\{\sup(k-l_2+1, \ldots, d-1)\}}^{(d)} \cdot \Gamma_{-;(-2)}$$

with some $\left(\frac{l_1-\sup(k, l_2)}{2}\right) \times \left(\frac{l_1-\sup(k, l_2)}{2} + 2\right)$ intertwining matrix $\Gamma_{-;(-2)}$, which is given by

$$\Gamma_{-;(-2)}(l_1, l_2) = \begin{bmatrix} \text{diag} & \frac{\nu_J + \rho_J - (\tilde{l}_2 + d + 2a + 2)}{d+1}(d+2) \\ 0 & \text{diag} & \frac{2a + 2}{d}(\nu_J + \rho_J - (\tilde{l}_2 + 2a + 3)) \end{bmatrix}$$

Slant-down relations: $\mathcal{C}_{-;0}: \tau(l_1, l_2) \rightarrow \tau(l_1, l_2 - 2)$ (3 cases)

(ii) If $(l_1, l_2)$ has odd micro-parity with $l_2 \leq k - 1$, we have $m' = m - 1$ and

$$\mathcal{C}_{-;0} s_{\{\sup(k-l_2, p_k(l_2)), \ldots, d-p_k(l_1)\}}^{(d)} \Delta l_2 = s_{\{\sup(k-l_2+1, \ldots, d-1)\}}^{(d)} \cdot \Gamma_{-;0}$$

with some $\left(\frac{l_1-k}{2}\right) \times \left(\frac{l_1-k+2}{2}\right)$ intertwining matrix $\Gamma_{-;0}$, which is given by

$$\Gamma_{-;0}(l_1, l_2) = \begin{bmatrix} \text{diag} & \frac{\nu_J + \rho_J - (l_2 + 2a + 1)}{d} \left(\frac{d-2a}{d}\right) \\ 0 & \text{diag} & \frac{2a + 2}{d}(\nu_J + \rho_J - (l_2 + 2a + 3)) \end{bmatrix}$$
(iii) If \((l_{1}, l_{2})\) has odd micro-parity with \(l_{2} + 1 \geq k\), we have \(m' = m\) and

\[
C_{-(i)(0)}s_{[0, \ldots, d-1]}^{(d)}\Delta^{l_{2}} = s_{[0, \ldots, d-1]}^{(d)}\Delta^{l_{2}-1} \cdot \Gamma_{-(i)(0)}
\]

with some \(\frac{d+1}{2} \times \frac{d+1}{2}\) intertwining matrix \(\Gamma_{-(i)(0)}\), which is given by

\[
\Gamma_{-(i)(0)(10)}(l_{1}, l_{2}) = \begin{bmatrix}
\text{diag}_{0 \leq s \leq \frac{d-1}{2}} \left( \frac{d-2a}{d} \right) & 0 \\
0 & 0
\end{bmatrix}
\]

(iv) If \((l_{1}, l_{2})\) has even micro-parity, we have \(m' = m\) and

\[
C_{-(i)(0)}s_{[\sup\{k-l_{2},0\}, \ldots, d-1]}^{(d)}\Delta^{l_{2}} = s_{[\sup\{k-l_{2}+1,1\}, \ldots, d]}^{(d+2)}\Delta^{l_{2}+1} \cdot \Gamma_{-(i)(0)**}
\]

with some \(\frac{1}{2}(l_{1}-k+3) \times \frac{1}{2}(l_{1}-k+3)\) intertwining matrix \(\Gamma_{-(i)(0)**}\), which is given by

\[
\Gamma_{-(i)(0)(01)}(l_{1}, l_{2}) = \begin{bmatrix}
\text{diag}_{0 \leq s \leq \frac{d-1}{2}} \left( \frac{d-2a}{d} \right) & 0 \\
0 & 0
\end{bmatrix}
\]

**Going-down relations:** \(C_{-(i)(2)} : \tau(l_{1}, l_{2}) \to \tau(l_{1}, l_{2}-2)\) (2 case)

(v) If \(\tilde{l}_{2} \leq k\), we have \(m' = m\) and

\[
C_{-(i)(2)}s_{[k-l_{2}, \ldots, d-1]}^{(d)}\Delta^{l_{2}} = s_{[k-l_{2}, \ldots, d-1]}^{(d+2)}\Delta^{l_{2}+2} \cdot \Gamma_{-(i)(2)}(\pi_{P_{j}, k}; (l_{1}, l_{2}))
\]

with some \(\frac{1}{2}(k-l_{2}-1) \times \frac{1}{2}(k-l_{2}-1)\) intertwining matrix \(\Gamma_{-(i)(2)}(\pi_{P_{j}, k}; (l_{1}, l_{2}))\), which is given by

\[
\Gamma_{-(i)(2)}(l_{1}, l_{2}) = \begin{bmatrix}
\text{diag}_{0 \leq s \leq \frac{d-1}{2}} \left( \frac{(d-2a)(d-2a-2)}{d+1} \right) & 0 \\
0 & 0
\end{bmatrix}
\]

(vi) If \(\tilde{l}_{2} \geq k+2\), we have \(m' = m + 1\) and

\[
C_{-(i)(2)}s_{[\beta_{a}(l_{1}), \ldots, d-\beta_{a}(l_{2})]}^{(d)}\Delta^{l_{2}} = s_{[\beta_{a}(l_{1}), \ldots, d-\beta_{a}(l_{2})]}^{(d+2)}\Delta^{l_{2}+2} \cdot \Gamma_{-(i)(2)}(l_{1}, l_{2})
\]
with some \( \frac{(d+1)}{2} \times \frac{(d+3)}{2} \) intertwining matrix \( \Gamma_{-;(+2)}(l_1,l_2) \), which is given by

\[
\begin{bmatrix}
\text{diag}_{0 \leq a \leq \frac{d-1}{2}} \left( \frac{(d-2a)(d+1-2a)}{(d+1)(d+2)} \right) (k - l_2 - 2a) \\
0
\end{bmatrix}
\]

3 Embedding of the discrete series into \( P_J \)
principal series as \((g,K)\) modules

Here we discuss an example. The embedding of the holomorphic discrete series is well-known. So we omit that here.

3.1 Successive composition of the contiguous relations

We have the contiguous equation:

\[
C_{-;(+2)}^{(2a)} \{ s_{2a}^{(2a)} \Delta^{k-2a} \} = \{ s_{2a+2}^{(2a+2)} \Delta^{k-2a-2} \} \cdot (\nu_J + \rho_J - k + 2a).
\]

An equivalent equation for generic \( \nu_J \) is

\[
s_{2b}^{(2b)} \Delta^{(k-2b)} = \frac{1}{\nu_J + \rho_J - k + 2b - 2} C_{-;(+2)}^{(2b-2)} \cdot \Delta^{2b-2}.
\]

Remark The successive application of the above equations gives

\[
s_{2b}^{(2b)} \Delta^{k-2b} = \prod_{i=0}^{b-1} \frac{1}{\nu_J + \rho_J - k + 2i} \cdot C_{-;(+2)}^{(2b-2)} \cdot \Delta^{k}.
\]

3.2 Embedding of the large discrete series

Proposition E.2 Let \( D_{(k,l)}^{(+,-)} \) be a large discrete series with Blattner parameter \((k,l)\) \((k + l \geq 2, l < 0)\). Then there is an embedding of \((g,K)\) modules into the \( P_J \) principal series \( \pi_{P_J, (\nu_J, \epsilon \otimes D_{k}^{\pm})} \) (if and) only if \( \nu_J = -l \).
Proof) $\nu_J + \rho_J + k - 2a_{fin} - 2 = 0$, i.e., $\nu_J = 2a_{fin} - k = -l$. And $l = k - 2a_{fin}$ or $a_{fin} = (k - l)/2$. The assumption $l < 0$ and $k + l \geq 2$ implies that

$$k/2 < a_{fin} < k - 1.$$  

Remark The vanishing of intertwining constant:

$\nu_J + \rho_J - k + 2i = 0$ is equivalent to $2a_{fin} - 2k + 2i -$, i.e., $i = k - a_{fin}$.

This means that $1 \leq i = k - \frac{k-l}{2} = \frac{k+l}{2} < a_{fin}$.
