Kyoto University
A CLASSICAL APPROACH TO STUDIES ON PROPAGATION OF ANALYTIC SINGULARITIES

SEIICHIRO WAKABAYASHI (UNIV. OF TSUKUBA 若林誠一郎)

1. Introduction

It is natural to consider the problems in the framework of hyperfunctions, when we study “propagation of analytic singularities.” Many authors have investigated such problems from the viewpoint of “Algebraic Analysis.” On the other hand, “propagation of singularities” has been investigated in the frameworks of $C^\infty$ or Gevrey classes by applications of “Classical Analysis.” In this article we attempt to study “propagation of analytic singularities,” applying “Classical Analysis.” There is Hörmander’s book [3] for a short introduction to theory of hyperfunctions, which is not so hard for us, studying in the $C^\infty$ category, to understand. There is also Treves’ book as to analytic pseudodifferential operators, which were studied by Boutet de Monvel and Kree [1]. Combining the methods in these two books, we will apply the arguments in Kajitani and Wakabayashi [4] to the studies of “propagation of analytic singularities.”

2. Function spaces

Let $\varepsilon \in \mathbb{R}$, and denote $\langle \xi \rangle = (1 + |\xi|^2)^{1/2}$, where $\xi = (\xi_1, \cdots, \xi_n) \in \mathbb{R}^n$. We denote

$$\hat{S}_\varepsilon := \{ v(\xi) \in C^\infty(\mathbb{R}^n); e^{\varepsilon \langle \xi \rangle} v(\xi) \in S \}.$$ 

we say that $v_j \to v$ in $\hat{S}_\varepsilon$ as $j \to \infty$ if $e^{\varepsilon \langle \xi \rangle} v_j(\xi) \to e^{\varepsilon \langle \xi \rangle} v(\xi)$ in $S$ as $j \to \infty$. Since $D$ is dense in $\hat{S}_\varepsilon$, it is obvious that the dual space $\hat{S}'_\varepsilon$ of $\hat{S}_\varepsilon$ is identified with \{ $e^{\varepsilon \langle \xi \rangle} v(\xi) \in D'; v \in S'$\}. For $\varepsilon \geq 0$ we can define

$$S_\varepsilon := \mathcal{F}^{-1}[\hat{S}_\varepsilon] ( = \mathcal{F}[\hat{S}_\varepsilon] = \{ u \in S; e^{\varepsilon \langle \xi \rangle} \hat{u}(\xi) \in S \}),$$

where $\mathcal{F}$ and $\mathcal{F}^{-1}$ denote the Fourier transformation and the inverse Fourier transformation on $S$ (or $S'$), respectively, and $\hat{u}(\xi) = \mathcal{F}[u](\xi)$. We introduce the
topology in $S_\epsilon$ so that $F : \hat{S}_\epsilon \rightarrow S_\epsilon$ is homeomorphic. Denote by $S_\epsilon'$ the dual space of $S_\epsilon$ for $\epsilon \geq 0$. Then we can define the transposed operators $^t F$ and $^t F^{-1}$ of $F$ and $F^{-1}$ which map $S'_\epsilon$ and $\hat{S}'_\epsilon$ onto $\hat{S}'_\epsilon$ and $S'_\epsilon$, respectively. Since $\hat{S}'_\epsilon \subset \hat{S}'_{\epsilon'}$ for $\epsilon \geq 0$, we can define $S_{\epsilon'} := t F^{-1}[\hat{S}_\epsilon]$ for $\epsilon \geq 0$.

Then we can define the transposed operators $t F$ and $t F^{-1}$ of $F$ and $F^{-1}$ which map $S_{\epsilon'}$ and $\hat{S}_\epsilon$ onto $\hat{S}_\epsilon'$ and $S_{\epsilon'}$, respectively. Since $\hat{S}_- \subset \hat{S}_{\epsilon'}$ for $\epsilon \geq 0$, we can define $S_{-\epsilon} := t F^{-1}[\hat{S}_-]$ for $\epsilon \geq 0$.

We can see that $S_{-\epsilon} := t F^{-1}[\hat{S}_-]$ is the dual space of $S_{\epsilon'}$, $\hat{S}_{-\epsilon} \subset \hat{S}_\epsilon'$ and $S'_\epsilon \subset S_{\epsilon'}$ for $\epsilon \geq 0$, and that $F = t F$ on $S'.$ Let $K$ be a compact subset of $C^n$, and let $A'(K)$ be the space of analytic functionals carried by $K$. Denote $A'$ ($= A'(R^n)$) := $\bigcup_{K \propto R^n} A/(K)$. Then we have

$$A' \subset \cap_{\epsilon > 0} S_\epsilon \subset F := \cap_{\epsilon > 0} S'_\epsilon.$$ 

Following [3], we put

$$U(x, x_{n+1}) = (sgn x_{n+1}) \exp[-|x_{n+1}|(D)]u(x)/2$$

$$= (sgn x_{n+1})F^{-1}_\xi[\exp[-|x_{n+1}|(\xi)]\hat{u}(\xi)](X)/2$$

for $u \in \mathcal{F}$,

where $x = (x_1, \cdots, x_n) \in R^n$, $x_{n+1} \in R$ and $D = i^{-1}\partial = i^{-1}(\partial/\partial x_1, \cdots, \partial/\partial x_n)$.

Then we can see that

$$U(x, x_{n+1}) \in C^\infty(R^{n+1} \setminus (R^n \times \{0\})),$$

$$U(x, x_{n+1}) = -U(x, -x_{n+1}) \text{ if } x_{n+1} \neq 0,$$

$$U(x, x_{n+1})|_{x_{n+1} > 0} \in C^\infty([0, \infty); F),$$

$$u(x) = U(x, +0) - U(x, -0),$$

$$(1 - \Delta_{x,x_{n+1}})U(x, x_{n+1}) = 0 \text{ in } R^{n+1} \setminus (R^n \times \{0\}).$$

We can define $\text{supp } u$ for $u \in \mathcal{F}$ as follows;

$$x^0 \notin \text{supp } u \iff "U(x, x_{n+1})" \text{ can be extended in a neighborhood of } (x^0, 0) \text{ as a } C^2\text{-function.}$$

Then, for a compact subset $K$ of $R^n$ we have the following:

(i) $u \in A'(K) \iff \text{supp } u \subset K$,

(ii) $\exists v \in F \text{ s.t. } \text{supp } v \subset K \text{ and } \text{supp } (u - v) \subset \overline{R^n \setminus K}$, where $\overline{A}$ denotes the closure of $A$. Moreover, $\text{supp } (v - w) \subset \partial K$ if $w \in F$, $\text{supp } w \subset K$ and $\text{supp } (u - w) \subset \overline{R^n \setminus K}$, where $\partial K$ denotes the boundary of $K$ in $R^n$. 

118
For a bounded open subset $\Omega$ of $\mathbb{R}^n$ the space of hyperfunctions $B(\Omega)$ in $\Omega$ is defined by

$$B(\Omega) = \mathcal{A}'(\overline{\Omega}) / \mathcal{A}'(\partial \Omega)$$

(see [3]). By the property (ii) of $\text{supp } u$ we can define

$$\text{supp } [u] = \text{supp } u \cap \Omega,$$

where $u \in \mathcal{A}'(\overline{\Omega})$ and $[u]$ ($\in B(\Omega)$) denotes the residue class of $u$. We can also define the restriction $u|_{\omega}$ of $u \in B(\Omega)$ to an open subset $\omega$ of $\Omega$. For any open subset $\Omega$ of $\mathbb{R}^n$ (or any real analytic manifold $\Omega$) the space $B(\Omega)$ of hyperfunctions in $\Omega$ is defined by its sheaf property (see [3]). We note that hyperfunctions can be locally identified with elements in $\mathcal{A}'$.

3. Pseudodifferential operators in $S'_\epsilon$

Let $R_0 > 0$ and $\delta_1, \delta_2 \in \mathbb{R}$, and let $a(\xi, y, \eta)$ and $b(\xi, y, \eta)$ be symbols in $C^\infty(\mathbb{R}_\xi^n \times \mathbb{R}_y^n \times \mathbb{R}_\eta^n)$ satisfying

$$|\partial_\xi^\alpha D_y^\beta \partial_\eta^\gamma a(\xi, y, \eta)| \leq C_{\alpha, \gamma}(B/R_0)^{1|\beta|}\langle \xi \rangle^{m_1+|\beta|}\langle \eta \rangle^{m_2}$$

$$\times \exp[\delta_1\langle \xi \rangle + \delta_2\langle \eta \rangle]$$

if $\langle \xi \rangle \geq R_0|\beta|$, 

$$|\partial_\xi^\alpha D_y^\beta \partial_\eta^\gamma b(\xi, y, \eta)| \leq C_{\alpha, \gamma}(B/R_0)^{1|\beta|}\langle \xi \rangle^{m_1+|\beta|}$$

$$\times \exp[\delta_1\langle \xi \rangle + \delta_2\langle \eta \rangle]$$

if $\langle \eta \rangle \geq R_0|\beta|$.

Define

$$a(D_x,y,D_y)u(x) = (2\pi)^{-n}\mathcal{F}_{\xi}^{-1}\left[\int e^{-iy\cdot\xi} \left(\int e^{iy\cdot\eta} a(\xi, y, \eta) \hat{u}(\eta) d\eta\right) dy\right](x)$$

for $u \in S_\infty := \cap_{\epsilon} S_\epsilon$.

**Proposition 3.1.** $a(D_x,y,D_y)$ (resp. $b(D_x,y,D_y)$) can be defined as a continuous linear operator, which maps $S_{\epsilon_2}$ to $S_{\epsilon_1}$ and $S'_{-\epsilon_2}$ to $S'_{-\epsilon_1}$, if $\epsilon > 0$, $\epsilon_2 > \delta_1 + \delta_2 + \epsilon_1$, $R_0 \geq \max\{1, \epsilon_2 \epsilon \epsilon \max\{1 + \sqrt{2}, B\}(\epsilon_2 - \epsilon_1 - \delta_1 - \delta_2)^{-1}\}$ and $1/R_0 \geq \epsilon'$, where $\epsilon = \epsilon_2 - \delta_2$ and $\epsilon' = \epsilon_1 + \delta_1$ (resp. $\epsilon = -\epsilon_1 - \delta_1$ and $\epsilon' = \delta_2 - \epsilon_2$). In particular, $a(D_x,y,D_y)$ maps continuously $\cup_{\epsilon>0} S_\epsilon$ to $\cup_{\epsilon>0} S_\epsilon$ and $b(D_x,y,D_y)$ maps continuously $\mathcal{F}$ to $\mathcal{F}$, if $\delta_1 = \delta_2 = 0$. 
We need symbol calculus for a various kind of symbol classes. We give here only a few results on symbol calculus. Let $\mathcal{U}$ be an open conic set in $T^*\mathbb{R}^n \setminus 0$. First we assume that $a(x, \xi, y, \eta)$ satisfies the following: (i)

\[
|D_x^{\beta+\tilde{\beta}} D_y^{\alpha+\tilde{\alpha}} D_{\xi}^{\lambda+\tilde{\lambda}} D_{\eta}^{\rho+\tilde{\rho}} a(x, \xi, y, \eta)| \\
\leq C_{|\alpha|, |\beta|} (A_1/R_0)^{|\alpha|} (B_1/R_0)^{|\beta|} (A_2/R_0)^{|\rho|} (B_2/R_0)^{|\rho|} \\
\times \langle \xi \rangle^{m_1} |\alpha| \langle \eta \rangle^{m_2} |\beta| \exp[\delta_1(\xi) + \delta_2(\eta)] \\
\text{if } |\xi| \geq R_0(|\alpha| + |\beta|) \text{ and } |\eta| \geq R_0(|\rho| + |\lambda|).
\]

(ii) $\delta \leq 0$ or $\exists \epsilon > 0$:

\[
|D_x^{\beta+\tilde{\beta}} D_y^{\alpha+\tilde{\alpha}} D_{\xi}^{\lambda+\tilde{\lambda}} D_{\eta}^{\rho+\tilde{\rho}} a(x, \xi, y, \eta)| \\
\leq C_{|\alpha|, |\beta|} (A_1/R_0)^{|\alpha|} (B_1/R_0)^{|\beta|} (A_2/R_0)^{|\rho|} (B_2/R_0)^{|\rho|} \\
\times \langle \xi \rangle^{m_1} |\alpha| \langle \eta \rangle^{m_2} |\beta| \langle |\xi| + |\eta| \rangle |\lambda| \exp[\delta_1(\xi) + \delta_2(\eta)] \\
\text{if } |x - y| < \epsilon, \langle \xi \rangle \geq R_0(|\alpha| + |\beta|), \langle \eta \rangle \geq R_0|\rho| \text{ and } (\xi + |\eta|) \geq R_0|\lambda|.
\]

(iii) $\exists \epsilon > 0$ and $0 \leq \epsilon' \leq 1/2$:

\[
|D_x^{\beta+\tilde{\beta}} D_y^{\alpha+\tilde{\alpha}} D_{\xi}^{\lambda+\tilde{\lambda}} D_{\eta}^{\rho+\tilde{\rho}} a(x, \xi, y, \eta)| \\
\leq C_{|\alpha|, |\beta|} (A_1/R_0)^{|\alpha|} B_1^{[|\beta|]} (A_2/R_0)^{|\rho|} B_2^{[|\rho|]} |\beta| |\lambda|! \\
\times \langle \xi \rangle^{m_1} |\alpha| \langle \eta \rangle^{m_2} |\beta| \langle |\xi| + |\eta| \rangle |\lambda|! \exp[\delta_1(\xi) + \delta_2(\eta)] \\
\text{if } (x, \eta) \in \mathcal{U}, |x - y| < 2\epsilon, |\xi - \eta| < 2\epsilon' \langle \eta \rangle, \langle \xi \rangle \geq R_0|\alpha| \text{ and } \langle \eta \rangle \geq R_0|\rho|.
\]

(iv)

\[
|D_x^{\beta+\tilde{\beta}} D_y^{\alpha+\tilde{\alpha}} D_{\xi}^{\lambda+\tilde{\lambda}} D_{\eta}^{\rho+\tilde{\rho}} a(x, \xi, y, \eta)| \\
\leq C_{|\alpha|, |\beta|} (A_1/R_0)^{|\alpha|} B_1^{[|\beta|]} (A_2/R_0)^{|\rho|} (B_2/R_0)^{|\rho|} |\beta|! |\lambda|! \\
\times \langle \xi \rangle^{m_1} |\alpha| \langle \eta \rangle^{m_2} |\beta| \langle |\xi| + |\eta| \rangle |\lambda|! \exp[\delta_1(\xi) + \delta_2(\eta)] \\
\text{if } (x, \eta) \in \mathcal{U}, \langle \xi \rangle \geq R_0|\alpha| \text{ and } \langle \eta \rangle \geq R_0(|\rho| + |\lambda|).
\]

(v) $\exists \epsilon > 0$:

\[
|D_x^{\beta+\tilde{\beta}} D_y^{\alpha+\tilde{\alpha}} D_{\xi}^{\lambda+\tilde{\lambda}} D_{\eta}^{\rho+\tilde{\rho}} a(x, \xi, y, \eta)|
\]
\begin{align*}
&\leq C_{|\alpha|}|\alpha| (A_1/R_0)^{|\alpha|} (A_2/R_0)^{|\beta|} (B_2/R_0) |\lambda^1 + |\lambda^2|^2 |\beta| \\
&\times (\xi)^{m_1 - |\alpha| + |\lambda^1|} (\eta)^{m_2 - |\alpha| + |\lambda^2|} \exp[\delta_1 (\xi) + \delta_2 (\eta)] \\
&\text{if } (x, \eta) \in U, |x - y| < 2\varepsilon, (\xi) \geq R_0 (|\alpha| + |\lambda^1|) \text{ and } (\eta) \geq R_0 (|\rho| + |\lambda^2|).
\end{align*}

Formally we define

$$a(x, D_x, y, D_y) u(x) = \lim_{\nu \downarrow 0} (2\pi)^{-n} \int \exp[-\nu|\eta|^2] e^{ix}\eta$$

$$\times \left( \int (\int e^{iy(\epsilon - \eta)}) \hat{u}(\xi) a(X, \eta, y, \xi) d\xi \right) dy \quad \text{for } u \in S_\infty.$$

**Lemma 3.2.** (i) $a(x, D_x, y, D_y)$ is well-defined and maps continuously $S_{3\delta_1 + \delta_2}$ to $S$ if $R_0 \geq R_0(A_1, B_2)$, $1/R_0 > 3\delta_1$ and $\delta_1 > 0$, where $R_0(A_1, B_2)$ is a constant depending on $A_1$ and $B_2$ and locally bounded with respect to $A_1$ and $B_2$. Moreover, $a(x, D_x, y, D_y)$ maps continuously $S_{\delta_2}$ to $S$ if $\delta_1 \leq 0$. (ii) Put

$$a(x, D_x, y, D_y) u(x) = \lim_{\nu \downarrow 0} (2\pi)^{-2n} \int \exp[-\nu|\eta|^2] e^{ix}\eta$$

$$\times \left( \int (\int e^{iy(\epsilon - \eta)}) \hat{u}(\xi) a(X, \eta, y, \xi) d\xi \right) dy \quad \text{for } u \in S_\infty.$$

where the $\phi_j^R(\xi)$ are chosen so that $\phi_j^R(\xi) = 0$ if $|\xi| \leq 2R_j$, $\phi_j^R(\xi) = 1$ if $|\xi| \geq 3R_j$, and $|\partial_\xi^{\alpha + \tilde{\alpha}} \phi_j(\xi)| \leq c_{|\tilde{\alpha}|} (c_0/R)^{|\alpha|} |\lambda^1(\xi) - \lambda^1| |\alpha^1|$ if $|\alpha| \leq 2j$. Then,

$$|a_{(\beta) + \tilde{\alpha}}(\xi)| \leq C_{|\alpha|} (C_0/R)^{|\alpha|} |(2R_0)^{|\beta|} (B/(2R_0))^{|\beta|} (\xi)^{m_1 + m_2 - |\alpha|} e^{\delta(\xi)}$$

if $|\xi| \geq 2R_0 |\alpha|, |\xi| \geq 2R_0 |\beta|, \delta = \delta_1 + \delta_2 + nA_1 B_2 / R_0^2, A \geq 2(A_1 + A_2 + C_0/4)$ and $B \geq 2(B_1 + B_2)$. (iii) There is a symbol $r(x, \xi)$ such that $a(x, D_x, y, D_y) = a(x, D) + r(x, D)$ on $S_\infty$ and

$$|r_{(\beta) + \tilde{\alpha}}(\xi)| \leq C_{|\alpha|} |\lambda^1| (\xi)^{m_1 + m_2} e^{\delta(\xi)}$$

if $\kappa > 0, R_0 \geq R_1(A_1, B_2, 1/\epsilon, \kappa), 1/R_0 > 3\delta_1$ and $1/R_0 \geq \max\{4(\delta_1)_+ + \delta_2, 9(\delta_1)_+, 6\delta_1 + 12(\delta_1)_+ + 12\delta_2, 18(\delta_1)_+ - 16(\delta_2)_- \}, (x, \xi) \in U, (\xi) \geq 2R_0 |\alpha|$ and $R_0 \geq 4nA_1 B_2', \text{ and}$

$$|r_{(\beta)}(\xi)| \leq C_{|\alpha|} R_0 B(B_1, B_2', 1/\epsilon, R_0/\kappa, \epsilon' R_0/\kappa)^{|\beta|} |\beta|$$

if $A \geq A_1 + A_2 + C_0/4, B' \geq 2 \max\{B_1', 2B_2'\}, (x, \xi) \in U, (\xi) \geq 2R_0 |\alpha| \text{ and } R_0 \geq 4nA_1 B_2'. \text{ and}$
\[ \times \langle \xi \rangle^{(m_1)+m_2} \exp[-\kappa \langle \xi \rangle / R_0] \]

if \((x, \xi) \in \mathcal{U}, \kappa > 0, R_0 \geq R_2(A_1, B_2, B_2', 1/\varepsilon, 1/\varepsilon', \kappa), 1/R_0 > 3\delta_1 \text{ and } 1/R_0 \geq \max\{2\delta_1 + 2\varepsilon |\delta_1| + 2\delta_2, 4(\delta_1)_+ + \delta_2, 2\delta_1 + |\delta_1|, 4\delta_1 + 2|\delta_1| + 2\delta_2\}/(2\kappa). \]

Next assume that \(a(\xi, x, \eta, y, \zeta)\) satisfies

\[
|\partial_{\xi}^{\alpha+\tilde{\alpha}} D_{x}^{\beta+\tilde{\beta}} \partial_{\eta}^{\gamma+\tilde{\gamma}} D_{y}^{\lambda+\tilde{\lambda}} \partial_{\zeta}^{\rho+\tilde{\rho}} a(\xi, x, \eta, y, \zeta)|
\leq C_{|\tilde{\alpha}|, |\tilde{\beta}|, |\tilde{\rho}|}(1, |\tilde{\gamma}|, |\tilde{\lambda}|)^{\alpha} (B_{1}/R_{0})^{1/\beta} (B_{2}/R_{0})^{1/\gamma} (B_{3}/R_{0})^{1/\rho} \exp[\delta_1(\xi) + \delta_2(\eta) + \delta_3(\zeta)]
\]

if \((\xi) \geq R_0(|\alpha| + |\beta|), (\eta) \geq R_0(|\gamma| + |\beta| + |\lambda|) \text{ and } (\zeta) \geq R_0(|\rho| + |\lambda|), \text{ and}\]

\[
|\partial_{\xi}^{\alpha+\tilde{\alpha}} D_{x}^{\beta+\tilde{\beta}} a(\xi, x, \eta, y, \zeta)|
\leq C_{|\tilde{\alpha}|, |\tilde{\beta}|}(1, |\tilde{\gamma}|, |\tilde{\lambda}|)^{\alpha} (B_{1}/R_{0})^{1/\beta}(B_{2}/R_{0})^{1/\gamma} (B_{3}/R_{0})^{1/\rho} \exp[\delta_1(\xi) + \delta_2(\eta) + \delta_3(\zeta)]
\]

if \((\xi, \zeta) \in \mathcal{U}, |\xi| \geq R_0/4, |\eta| \geq R_0/4, |\zeta| \geq R_0/4, |x - y| < 2\varepsilon, |\eta - \zeta| < \varepsilon'(\zeta), (\xi) \geq R_0|\alpha|, (\eta) \geq R_0|\gamma| \text{ and } (\zeta) \geq R_0|\rho|, \text{ where } \varepsilon > 0 \text{ and } 0 < \varepsilon' \leq 1. \]

Formally we define

\[
a(D_x, y, D_y, w, D_w)u(x) = \mathcal{F}_\eta^{-1}\left[\lim_{\nu \to 0} (2\pi)^{-2n} \int \left( \int \left( \int \exp[-\nu |\zeta|^2] \times e^{iy\cdot(\zeta - \eta)} e^{iw\cdot(\zeta - \xi)} a(\eta, y, \zeta, w, \xi) \hat{u}(\xi) d\xi \right) dw \right) d\zeta \right](x)
\]

for \(u \in S_\infty. \)

**Lemma 3.3.** (i) \(a(D_x, y, D_y, w, D_w)\) is well-defined and maps continuously \(S_3(\delta_1') \to S_{-\delta_1}\) if \(R_0 \geq R_3(B_2), 1/R_0 > 3\delta_2 \text{ and } \delta_1' > \delta_1. \) (ii) Put

\[
a(\xi, y, \eta) = \sum_{j=0}^{\infty} \phi_j^{4R_0}(\eta) a_j(\xi, y, \eta),
\]

\[
a_j(\xi, y, \eta) = \sum_{|\gamma| = j} \gamma!^{-1} \partial_{\xi}^{\gamma} D_{x}^{\alpha} a(\xi, y, \eta + \zeta + y, w, \eta)|_{w=0, \zeta=0}.
\]

Then,

\[
|\partial_{\xi}^{\alpha+\tilde{\alpha}} D_{x}^{\beta+\tilde{\beta}} \partial_{\eta}^{\gamma+\tilde{\gamma}} a(\xi, y, \eta)| \leq C_{|\tilde{\alpha}|, |\tilde{\beta}|}(A_1/R_0)^{|\alpha|}(B/R_0)^{|\beta|}.
\]
\[ \times (A/R_0)\vert^{\rho}(\xi)^{m_1-|\tilde{\alpha}|} (\eta)^{m_2+m_3-|\tilde{\rho}|+|\beta|} \exp[\delta_1(\xi) + \delta(\eta)] \]

if \( \langle \xi \rangle \geq R_0|\alpha|, \langle \eta \rangle \geq 2R_0(|\beta| + |\rho|), \delta = \delta_2 + \delta_3 + nA_2B_2/R_0^2, A \geq A_2 + A_3 + C_0/4 \) and \( B \geq B_1 + B_2. \) (iii) There is a symbol \( r(\xi, y, \eta) \) such that \( a(D_x, y, D_y, w, D_w) = a(D_x, y, D_y) + r(D_x, y, D_y) \) on \( S_\infty \) and

\[ |\partial_{\xi}^\alpha D_y^\beta \partial_{\eta}^\rho r(\xi, y, \eta)| \leq C|\tilde{\alpha}|,|\tilde{\beta}|,|\tilde{\rho}|, R_0(B(B_1, B_2', 1/\epsilon, R_0/\kappa)/R_0)^{1}\beta I\]

if \( \langle \xi \rangle \geq R_0|\beta|, \kappa > 0, R_0 \geq R_5(A_2, B_2, B_2'/\epsilon, 1/\epsilon', \kappa), 1/R_0 > 3\delta_2 \) and \( 1/R_0 \geq \max\{4(\delta_2)_+, \delta_3, \delta_2 + |\delta_2|/2\}/\kappa. \)

(iv) \( \langle \xi \rangle \geq R_0|\beta|, \kappa > 0, R_0 \geq R_4(A_2, B_2, B_2', 1/\epsilon, \kappa), 1/R_0 > 3\delta_2 \) and \( 1/R_0 \geq \max\{4(\delta_2)_+, \delta_3, \delta_2 + |\delta_2|/2\}/\kappa. \)

4. Analytic wave front sets and microfunctions

There are several definitions of analytic wave front sets which are equivalent to each other. For \( u \in A' \) we define the FBI transform \( T_{\lambda}u(z) \) by

\[ T_{\lambda}u(z) = u_y(\exp[-\lambda(z - y)^2/2]), \]

where \( \lambda > 0 \) and \( z \in \mathbb{C}^n. \) We say that \( (x^0, \xi^0) \) is \( \big(T^*\mathbb{R}^n \setminus 0\big) \setminus WF_A(u) \) if there is a neighborhood \( V \) of \( x^0 - i\xi^0/|\xi^0| \) and positive constants \( C \) and \( c \) such that

\[ |T_{\lambda}u(z)| \leq Ce^{\lambda(1/2-c)} \] for \( z \in V \) and \( \lambda > 0, \)

where \( u \in A' \). Since \( WF_A(u) \) is determined by the local properties of \( u \in A' \), the definition of \( WF_A(u) \) can be immediately extended to functions in \( \mathcal{F} \) and hyperfunctions.
Proposition 4.1. Let \( u \in \mathcal{F} \), and let \((x^0, \xi^0) \in T^* \mathbb{R}^n \setminus 0 \). Then, \((x^0, \xi^0) \notin WF_A(u)\) if and only if there are \( R_0 > 0 \) and a family \( \{g^R(\xi)\}_{R \geq R_0} \subset C^\infty(\mathbb{R}^n) \) such that \( g^R(\xi) = 1 \) in a fixed conic neighborhood \( \Gamma \) of \( \xi^0 \),

\[
|g^{R(\alpha+\beta)}(\xi)| \leq C_{|\alpha|}(C/R)^{|\alpha|}\langle \xi \rangle^{-|\beta|} \quad \text{if} \quad \langle \xi \rangle \geq R|\alpha|
\]

and \( g^R(D)u \) is analytic near \( x^0 \) for \( R \geq R_0 \).

Lemma 4.2. Let \( \Gamma \) be an open cone in \( \mathbb{R}^n \setminus \{0\} \), and let \( X \) be an open set in \( \mathbb{R}^n \). Assume that a symbol \( p(x, \xi) \) satisfies

\[
\text{supp} \ p(x, \xi) \cap X \times \Gamma = \emptyset, \quad |p^{(\alpha+\beta)}(x, \xi)| \leq C_{|\alpha|,|\beta|}(B/R_0)^{|\beta|}\langle \xi \rangle^{m+|\beta|} \quad \text{if} \quad \langle \xi \rangle \geq R_0|\beta|, \\
|p^{(\alpha)}(x, \xi)| \leq C_{|\alpha|}B^{|\beta|}||\beta||\langle \xi \rangle^m \quad \text{if} \quad x \in X.
\]

Then, \( WF_A(p(x, D)u) \cap X \times \Gamma = \emptyset \) if \( u \in \mathcal{F} \) and \( R_0 \geq \sqrt{n}e\max\{B, 2(1+\sqrt{2})\} \).

Let \( \mathcal{U} \) be an open conic subset of \( T^* \mathbb{R}^n \setminus 0 \), and define

\[
\mathcal{C}(\mathcal{U}) = B(\mathbb{R}^n) / \{ u \in B(\mathbb{R}^n); WF_A(u) \cap \mathcal{U} = \emptyset \}.
\]

Elements of \( \mathcal{C}(\mathcal{U}) \) are called microfunctions on \( \mathcal{U} \). Let \( \Omega \) be an open conic set in \( T^* \mathbb{R}^n \setminus 0 \), and let \( P(x, \xi) \in C^\infty(\Omega) \) satisfy

\[
\text{supp} \ P^{(\alpha)}(x, \xi) \subset X \times \gamma \cap \{ |\xi| \geq R_0 \}, \quad |P^{(\alpha)}(x, \xi)| \leq C_{|\alpha|}A^{|\alpha|}B^{|\beta|}|\alpha||\beta||\langle \xi \rangle^m-|\alpha|}
\]

Assume that \( X \times \gamma \subset X_1 \times \gamma_1 \subset \subset \Omega \), where \( X \) and \( X_1 \) are open sets in \( \mathbb{R}^n \), and \( \gamma \) and \( \gamma_1 \) are open conic sets in \( \mathbb{R}^n \setminus \{0\} \). Then we can construct a symbol \( \tilde{P}(x, \xi) \) so that \( \tilde{P}(x, \xi) = P(x, \xi) \) in \( X \times \gamma \cap \{ |\xi| \geq R_0 \} \), supp \( \tilde{P}(x, \xi) \subset X_1 \times \gamma_1 \), supp \( \tilde{P}(x, \xi) \subset \{ |\xi| \geq R_0/2 \} \) and

\[
|\tilde{P}^{(\alpha+\hat{\alpha})}(x, \xi)| \leq C_{|\alpha|,|\beta|}(A/R_0)^{|\alpha|}(B/R_0)^{|\beta|}\langle \xi \rangle^{m-|\alpha|+|\beta|} \quad \text{if} \quad \langle \xi \rangle \geq R_0|\alpha| \text{ and } \langle \xi \rangle \geq R_0|\beta|, \\
|\tilde{P}^{(\alpha)}(x, \xi)| \leq C_{|\alpha|}(A/R_0)^{|\alpha|}B^{|\beta|}||\beta||\langle \xi \rangle^m-|\alpha|}
\]

if \( x \in X \), \( \langle \xi \rangle \geq R_0|\alpha| \) and \( |\xi| \geq R_0 \).
\[ |\tilde{P}_{(\alpha+\beta)}(x, \xi)| \leq C_{|\tilde{\beta}|}A^{1|\alpha|}(B/R_0)^{|\beta|}|\alpha!!(\xi)^{|m-}|\alpha|||\beta||^{n}| \]

if \( \xi \in \gamma, \langle \xi \rangle \geq R_0|\beta| \) and \( |\xi| \geq R_0 \),

\[ |\tilde{P}_{(\beta)}(x, \xi)| \leq CA^{1|\alpha|}B^{1|\beta|}|\alpha!!(\xi)^{|m-}|\alpha||\beta||^{n} | \]

if \( x \in X, \xi \in \gamma \) and \( |\xi| \geq R_0 \).

From Lemma 4.2 it follows that \( \tilde{P}(x, D)u|_X \) is uniquely determined by \( P(x, D) \) and \( u \in \mathcal{F} \) modulo \( \{ f \in \mathcal{F}; WF_A(f) \cap X \times \gamma = \emptyset \} \) if \( R_0 \geq R_0(B, B') \).

We can also prove analytic pseudo-locality of \( \tilde{P}(x, D) \) in \( X \times \gamma \), shrinking \( X \times \gamma \) if necessary. Therefore, we can define \( P(x, D) : C(\Omega) \to C(\Omega) \) by \( P(x, D)u|_X = \tilde{P}(x, D)u|_X \) in \( A' \) for \( u \in \mathcal{F} \).

5. Propagation of singularities

Let \((x^0, \xi^0) \in T^*\mathbb{R}^n \setminus 0\), and let \( \Omega \) be a conic neighborhood of \((x^0, \xi^0)\) in \( T^*\mathbb{R}^n \setminus 0 \). Assume that \( P(x, \xi) \in C^\infty(\Omega) \) satisfies (4.1), and that \( u \in C(\Omega) \) satisfies \( P(x, D)u = 0 \) in \( C(\Omega) \). Under the above assumption we study conditions which give \( u = 0 \) near \((x^0, \xi^0)\) (in \( C(\Omega) \)). Let \( S \) be a closed conic subset of \( T^*\mathbb{R}^n \setminus 0 \) such that \((x^0, \xi^0) \in S\), and assume that

(A) \( \text{supp} u \subset S \), where \( \text{supp} u = WF_A(v) \cap \Omega \) if \( u \) is the residue class of \( v \) in \( B(\mathbb{R}^n) \).

We choose a real-valued function \( \varphi(x, \xi) \), which is defined in \( \Omega \) and positively homogeneous of degree 0, such that \( \varphi(x^0, \xi^0) = 0, \varphi(x, \xi) > 0 \) if \((x, \xi) \in S \setminus \{(x^0, \lambda \xi^0) ; \lambda > 0\}\), and

\[ |\varphi_{(\alpha)}(x, \xi)| \leq C_1 A_1^{1|\alpha|}B_1^{1|\beta|}|\alpha!!|\beta|| \quad \text{for} \quad (x, \xi) \in \Omega \quad \text{with} \quad |\xi| = 1. \]

Let \( \psi(\xi) \) and \( \lambda(\xi) \) be functions in \( C^\infty(\mathbb{R}^n) \) such that \( \psi(\xi) = 1 \) for \( |\xi| \geq 1 \) and \( \psi(\xi) = 0 \) for \( |\xi| \leq 1/2 \), \( C^{-1}(\xi) \leq \lambda(\xi) \leq C(\xi) \), \( \lambda(\xi) \in S_{1,0}^1 \) and

\[ |\lambda_{(\alpha)}(\xi)| \leq C_2 A_2^{1|\alpha|}|\alpha!!|\xi^{-1-|\alpha|} \quad \text{for} \quad (x, \xi) \in \Omega \quad \text{with} \quad |\xi| \geq 1. \]

Put

\[ \Lambda_{\delta, \alpha, j}^\xi \left( x, \xi \right) \left( = \Lambda_j \left( x, \xi \right) \right) = \{ a(\varphi(x, \xi) - 1/j)\lambda(\xi)^{1-\delta} + b(\varphi(x, \xi) + 1/j)\lambda(\xi) \} \psi(\xi), \]
where $a, b > 0$ and $0 \leq \delta \leq 1$. Let $P_{A_{j}}(x, \xi)$ be a symbol in $S_{1,0}^{m}$ satisfying

$$P_{A_{j}}(x, \xi) \sim \sum_{\gamma \lambda} (\lambda! \gamma!)^{-1} \partial^{\lambda}_{\xi} D^{\gamma} \partial^{\gamma} D^{w} \{ P(x + w + iA_{j}(x, y, \xi + \eta), \xi), N^{j}(x, y, \xi + \eta) \} \frac{\partial N^{j}(x, y, \xi + \eta)}{\partial \xi}(x, y, \xi + \eta) \bigg|_{y = w = 0, \eta = \xi = 0}$$

in $S_{1,0}^{m}(\Omega)$, where $a + b \leq \varepsilon(j) \ll 1$, $\Lambda_{j}(x, \xi, \eta) = \int_{0}^{1} \nabla \epsilon \Lambda_{j}(x, \xi + \theta \eta) d\theta$, $\Lambda_{j}(x, y, \xi) = \int_{0}^{1} \nabla_{x} \Lambda_{j}(x + \theta y, \xi) d\theta$ and $\eta = N^{j}(x, y, \zeta)$ is the solution of $\eta + iA_{j}(x, \xi + \eta) = \zeta$.

We assume that

(1) $\exists j_{0} \in \mathbb{N}$ and $\exists \chi(x, \xi) \in S_{1,0}^{0}$ s.t.

- $\chi(x, \xi)$ is positively homogeneous of degree 0 for $|\xi| \geq 1$,
- $\chi(x, \xi) = 1$ near $(x^{0}, \xi^{0}/|\xi^{0}|)$, and
- $\forall \delta > 0$, $\exists a_{0} > 0$ and $\exists b_{0} > 0$ s.t. $0 < a \leq a_{0}$, $0 < b \leq b_{0}$, $0 < \exists \delta_{0} \leq 1$, $\exists \epsilon > 0$ and $\exists \Psi(x, \xi) \in S_{1,0}^{0}$, which is positively homogeneous of degree 0 for $|\xi| \geq 1$, satisfying $\text{supp}\ \Psi \cap S = \emptyset$ and

$$\|D^{|\ell_{1}-1}v\| + \|D^{|\ell_{4}}(1 - \chi(x, D))v\| + \|D^{|\ell_{4}}(\psi(x, D))v\| \leq C \{ \|D^{|\ell_{1}}P_{A_{j}}(x, D)v\| + \|D^{|\ell_{1}-1}v\| + \|D^{|\ell_{1}}(1 - \chi(x, D))v\| + \|D^{|\ell_{1}}(1 - \chi(x, D))v\| \}$$

if $v \in C_{0}^{\infty}$ and $0 < \delta \leq \delta_{0}$, where $\| \cdot \|$ denotes the $L^{2}$-norm.

**Theorem 4.3.** Assume that (A) and (ME) are satisfied. Then, $u = 0$ near $(x^{0}, \xi^{0})$, i.e., $(x^{0}, \xi^{0}) \not\in \text{supp}\ u$.

We can prove the above theorem by the same idea as in [4], after establishing symbol calculus of analytic pseudodifferential operators and pseudodifferential operators introduced here.

Let us give some applications of Theorem 4.3. If $P(x, \xi)$ is microhyperbolic, then we can choose $\varphi(x, \xi)$ so that $P_{A_{j}}(x, \xi)$ is elliptic. Therefore, we can prove the results of Kashiwara and Kawai [5].

For Grušin type operators a priori estimates (energy estimates) are well-known (see [2]). So we can immediately prove the results on analytic hypoellipticity of Métivier [6] and Okaji [7] in the space of hyperfunctions (microfunctions) by Theorem 4.3.

Finally we consider analytic hypoellipticity of operators with double characteristics. Let $(x^{0}, \xi^{0}) = (0; 0, \cdots, 0, 1) \in T^{*} \mathbb{R}^{n} \setminus 0$, and let $P(x, \xi)$ be an analytic symbol.
defined in a conic neighborhood of \((x^0, \xi^0)\) such that \(P(x, \xi) = \xi_1^2 + \alpha(x, \xi_2, \cdots, \xi_n) + \beta(x, \xi)\) in a conic neighborhood of \((x^0, \xi^0)\), where \(\alpha(x, \xi_2, \cdots, \xi_n)\) is positively homogeneous of degree 2, \(\alpha(x, \xi_2, \cdots, \xi_n) \geq 0\) and \(\beta(x, \xi) \in S^1_{1,0}\) is a classical symbol. Put

\[ S = \{ (x, \xi) \in T^* \mathbb{R}^n \setminus 0; \; x' = 0, \; \xi' = 0 \}, \]

where \(1 \leq r \leq n - 1\), \(x' = (x_1, \cdots, x_r) \in \mathbb{R}^r\) and \(\xi' = (\xi_1, \cdots, \xi_r) \in \mathbb{R}^r\). We impose the following conditions:

(H-1) \(P(x, D)\) is analytic (micro) hypoelliptic in \(\Omega \setminus S\), where \(\Omega\) is a conic neighborhood of \((x^0, \xi^0)\).

(H-2) \(\exists U'\): a neighborhood of \((0,0)\) in \(\mathbb{R}^r \times \mathbb{R}^r\), \(\exists U''\): a complex neighborhood of \((0, \xi^{0''})\) in \(\mathbb{C}^{n-r} \times (\mathbb{C}^{n-r} \setminus \{0\})\) and \(\exists C > 0\) s.t.

\[ |\alpha(x', z'', \xi_2, \cdots, \xi_n, \zeta'/)| \leq c\alpha(X', 0, \xi_2, \cdots, \xi_n, \xi^{0'/}) \]

if \((x', \xi') \in U'\) and \((z'', \zeta'') \in U''\), where \(z'' = (z_{r+1}, \cdots, z_n) \in \mathbb{C}^{n-r}\) and \(\zeta'' = (\zeta_{r+1}, \cdots, \zeta_n) \in \mathbb{C}^{n-r}\).

(H-3) \(\exists \epsilon > 0, \exists C > 0\) and \(\exists q_j(x', \xi') \in S^1_{1,0} \) (\(1 \leq j \leq 2\ell\)) s.t.

\[ (1 - \epsilon)(\xi_1^2 + \text{Re} \alpha(x', z'', \xi_2, \cdots, \xi_r, \zeta'')) + \text{Re} \sum \sigma(P)(x', z'', \xi', \zeta'') \]

\[ - \sum_{j=1}^{2\ell} q_j(x', \xi')^2 + \sum_{j=1}^{\ell} \{q_{2j-1}, q_{2j}\}(x', \xi') \geq -C \]

for \((x', \xi') \in U'\) and \((z'', \zeta'') \in U''\), where \(\text{sub} \; \sigma(P)(x, \xi) = \beta^0(x, \xi) - (i/2) \sum_{j=1}^{n} (\partial^2 p/\partial x_j \partial \xi_j)(x, \xi), \; \beta^0(x, \xi)\) is the principal symbol of \(\beta(x, \xi)\) and \(p(x, \xi) = \xi_1^2 + \alpha(x, \xi_2, \cdots, \xi_n)\).

**Theorem 4.4.** Under the assumptions (H-1)–(H-3) \(P(x, D)\) is analytic (micro) hypoelliptic at \((x^0, \xi^0)\), i.e., \(\exists U\): a conic neighborhood of \((x^0, \xi^0)\) in \(T^* \mathbb{R}^n \setminus 0\) s.t. \(\text{supp} \; u \cap U = \text{supp} \; P(x, D)u \cap U\) for \(u \in C(U)\).

**Remark.** Let \(n = 3\), and let \(P(x, \xi) = \xi_1^2 + \xi_2^2 + a(x_1, x_2)b(x)\xi_3^3\) be an analytic symbol. Assume that \(a(x_1, x_2) \geq 0, \; a(x_1, x_2) \neq 0\) for \((x_1, x_2) \neq (0,0)\) and \(b(x) > 0\). Then, it follows from Theorem 4.4 that \(P(x, D)\) is analytic hypoelliptic.
