Tokyo Institute of Technology

#### 1 Introduction

In this paper, we consider the following elliptic system of diagonal type:

$$\Delta V + \lambda \left( 1 - |V|^2 \right) V = 0 \tag{1}$$

where  $V = (V^1, \dots, V^n)$  is defined on some domain in  $\mathbb{R}^{n+k}$ ,  $n \geq 2$ ,  $k \geq 1$ , and  $\lambda \in \mathbb{R}$  is a parameter.

Here, we construct some solutions of (1) on certain domains in  $\mathbb{R}^{n+k}$ , with boundary values, invariant under the action of a k-parameter group of isometries of  $\mathbb{R}^{n+k}$ , and having nontrivial k-dimensional zero sets.

When n=2, the equation (1) is the Ginzburg-Landau system (GLS), which is used as a mathematical model for many physical phenomena, such as super-conductivity and super-fluidity. In the theory of super-conductivity, the unknown V represents an order parameter which has two degrees of freedom, and its zero set, called *vortices*, corresponds to the region of the normal state in super-conductors. So, especially our result produces an example of solutions of the GLS in  $\mathbb{R}^3$  with curved vortex lines.

Some results concerning the isolated zeros of solutions of the GLS in  $\mathbb{R}^2$  are known([1], [2]), however there seems to be no explicit example of solutions with higher-dimensional nontrivial zero sets.

Our proof is based on the "equivariant construction" method due to N.Smale [9], in which the examples of minimal hypersurfaces in Euclidean spaces with higher-dimensional singularities are shown. Later, the same method was used to construct examples with higher-dimensional singularities, of harmonic maps [4], and of solutions of a certain non-linear elliptic equation [6].

Main result of this paper can be extended to equations with other type of nonlinearlities, but we do not pursue here for simplicity of description.

## 2 Notations and statement of the main result

We follow the setting of "equivariant construction" method described in the papers [9],[4] and [6]: Let  $n \geq 2$ ,  $k \geq 1$  be two integers. Let  $\mathcal{U} \subset \mathbf{R}^k$  be an open set containing  $\{0\} \in \mathbf{R}^k$  and assume that there is a  $C^{\infty}$  group action

$$\Phi: t \in \mathcal{U} \longmapsto \Phi(t) \in \text{Isom}(\mathbf{R}^{n+k}),$$

here Isom( $\mathbb{R}^{n+k}$ ) means the group of isometries of  $\mathbb{R}^{n+k}$ . We will denote  $\Phi(t)$  by  $G_t$ . We define

$$\Gamma = \{G_t(0) : t \in \mathcal{U}\}, 
\tilde{\mathbf{B}}^n = B_1^n(0) \times \{0\}_k = \{\tilde{x} = (x,0) \in \mathbf{R}^n \times \mathbf{R}^k, |x| < 1\}, 
\Omega = \{G_t(\tilde{\mathbf{B}}^n) : t \in \mathcal{U}\}.$$

So,  $\Gamma$  is the orbit of  $\{0\} \in \mathbf{R}^{n+k}$  of the group action  $\Phi$ , and  $\Omega$  is the unit *n*-disc bundle over  $\Gamma$  obtained by moving  $\tilde{\mathbf{B}}^n$  along  $\Gamma$  by  $G_t$ ,  $t \in \mathcal{U}$ . On the group action  $\Phi$ , we make the following assumptions:  $\Gamma$  is a properly embedded k-dimensional submanifold in  $\mathbf{R}^{n+k}$  and whenever  $G_t(0) = 0$ , we must have  $G_t(\tilde{\mathbf{B}}^n) = \tilde{\mathbf{B}}^n$  for any  $t \in \mathcal{U}$ , that is, the isotropy group of 0 is the same as the one of  $\tilde{\mathbf{B}}^n$ . Furthermore, when  $G_t = O(t) + v_t$  is the decomposition of the element of  $\operatorname{Isom}(\mathbf{R}^{n+k})$ , where  $O(t) \in O(n+k)$ , the orthogonal group of  $\mathbf{R}^{n+k}$ , and  $v_t \in \mathbf{R}^{n+k}$ , we define the group action

$$\Phi_{\varepsilon}: t \in \mathcal{U} \longmapsto G_t^{\varepsilon} \in \text{Isom}(\mathbf{R}^{n+k}),$$

and

$$\begin{array}{ll} \Gamma_{\epsilon} = & \{G^{\epsilon}_{t}(0) : t \in \mathcal{U}\} = \left(\frac{1}{\epsilon}\right) \Gamma, \\ \Omega_{\epsilon} = & \{G^{\epsilon}_{t}(\tilde{\mathbf{B}}^{n}) : t \in \mathcal{U}\}, \end{array}$$

where  $G_t^{\varepsilon} = O(t) + \frac{1}{\varepsilon}v_t$ . Note that under the assumption of the group action  $\Phi$ ,  $\Omega_{\varepsilon}$  is well-defined and then  $\Omega_{\varepsilon}$  is the unit *n*-disc bundle over  $\Gamma_{\varepsilon}$  obtained by moving  $\tilde{\mathbf{B}}^n$  along  $\Gamma_{\varepsilon}$  by  $G_t^{\varepsilon}$ ,  $t \in \mathcal{U}$ . Note also that when  $\varepsilon > 0$  is sufficiently small,  $\Omega_{\varepsilon}$  is close locally the trivial product bundle  $B_1^n(0) \times \mathbf{R}^k$  over  $\{0\}_n \times \mathbf{R}^k$ . Finally, for a map  $U : \mathbf{R}^{n+k} \to \mathbf{R}^n$ , we denote by  $\Gamma(U)$  the set of zeros of U, namely,  $\Gamma(U) = \{x : U(x) = 0 \in \mathbf{R}^n\}$ .

Now we state the main result of this paper.

Theorem For any  $\lambda \in \mathbf{R}$ , there exists an open domain  $\tilde{\Omega} \subset \mathbf{R}^{n+k}$  containing  $\Gamma$ , on which there are infinitely many solutions of (1) with boundary values, whose zero set is  $\Gamma$ .

In the proof of the theorem, we will show that there exists  $\bar{\varepsilon} > 0$  sufficiently small, such that for any  $0 < \varepsilon < \bar{\varepsilon}$ , there is a solution U of

$$\Delta U + \lambda \varepsilon^2 (1 - |U|^2) U = 0 \quad \text{in} \quad \Omega_{\varepsilon},$$
 (2)

$$\Gamma(U) = \Gamma_{\varepsilon} \tag{3}$$

with a boundary data fixed up to a finite dimensional space, and U is invariant under the action  $\Phi_{\varepsilon}$ , i.e,  $U(G_t^{\varepsilon}(\tilde{x})) = U(\tilde{x})$  for all  $\tilde{x} \in \tilde{\mathbf{B}}^n$  and  $t \in \mathcal{U}$ .

We will find a solution U of (2) by solving the appropriate fixed point problem. We make essential use of the invariant condition of U, thanks to which, we can think of (2) as a PDE on each fibers of the disc bundle  $\Omega_{\epsilon}$ , especially on  $\tilde{\mathbf{B}}^n$  for t=0. Note that the nonlinear term of (2) is well controlled when  $\epsilon$  is small enough, so we can get a solution as a perturbation of the  $\mathbf{R}^n$ -valued harmonic function  $v_0: B_1^n(0) \to \mathbf{R}^n, v_0(x) = x$ . Taking  $\tilde{\Omega} = \epsilon \cdot \Omega_{\epsilon}$ , and  $V(y) = U\left(\frac{y}{\epsilon}\right)$  for  $y \in \tilde{\Omega}$  will give the desired result. The domain  $\tilde{\Omega}$  so obtained, is the bundle over  $\Gamma$  of the n-dimensional discs of radius  $\epsilon$ , so looks like locally a thin perturbed tube of radius  $\epsilon$  with center axis  $\Gamma$ .

Now we describe our coordination of  $\Omega_{\varepsilon}$ : For  $y \in \Omega_{\varepsilon}$ , there exists  $x \in B_1^n(0)$  and  $t \in \mathcal{U}$  such that  $y = G_t^{\varepsilon}(\tilde{x})$ , then let us denote  $F : B_1^n(0) \times \mathcal{U} \to \Omega_{\varepsilon}$ ,  $F(x,t) = G_t^{\varepsilon}(\tilde{x})$ . we will introduce the local coordinate system by this map, and identify y with  $(r, \theta, t)$  where  $(r, \theta)$  are polar coordinates for  $x \in B_1^n(0)$ . So, functions defined on  $\Omega_{\varepsilon}$  can naturally be

considered as functions on  $B_1^n(0) \times \mathcal{U}$  by F. Note for  $\varepsilon > 0$  sufficiently small, r also is the distance to  $\Gamma_{\varepsilon}$ .

In the sequel we use the following function spaces: For  $\nu \in \mathbf{R}$ ,  $\alpha \in (0,1)$ , m=0,1,2, define

$$C^{m,\alpha,\nu}(\Omega_{\varepsilon};\mathbf{R}^n) = \{ u \in C^{m,\alpha}_{loc}(\Omega_{\varepsilon} \setminus \Gamma_{\varepsilon};\mathbf{R}^n) : |u|_{m,\alpha,\nu} < +\infty \},$$

where  $|\cdot|_{m,\alpha,\nu}$  is the norm

$$|u|_{m,\alpha,\nu} = \sup_{0 < s \le 1/2} \left( \sum_{j=0}^{m} |\nabla^{j} u|_{0,[s,2s]} s^{j-\nu} + \sum_{j=0}^{m} |\nabla^{j} u|_{(\alpha),[s,2s]} s^{j+\alpha-\nu} \right).$$

Here,  $\nabla$  and  $\nabla^2$  denote the gradient and Hessian respectively on  $\Omega_{\varepsilon}$ , and  $|\eta|_{0,[s,2s]}$  and  $|\eta|_{(\alpha),[s,2s]}$  are the sup norm and the  $\alpha$ -th Hölder seminorm of a function(or a section)  $\eta$  on  $\Omega_{\varepsilon}$  over the set  $\{y=y(r,\theta,t)\in\Omega_{\varepsilon}:s\leq r\leq 2s\}$ . These are Banach spaces under the norm  $|\cdot|_{m,\alpha,\nu}$ , and if  $u\in C^{m,\alpha,\nu}(\Omega_{\varepsilon};\mathbf{R}^n)$ , then |u| decays like  $r^{\nu}$  near  $\Gamma_{\varepsilon}$ .

Furthermore, let us define the closed subspace of  $C^{m,\alpha,\nu}(\Omega_{\varepsilon}; \mathbf{R}^n)$  as

$$C_G^{m,\alpha,\nu}(\Omega_{\varepsilon};\mathbf{R}^n) = \{ u \in C^{m,\alpha,\nu}(\Omega_{\varepsilon};\mathbf{R}^n) : u(G_t^{\varepsilon}(\tilde{x})) = u(\tilde{x}) \text{ for all } x \in B_1^n(0), \ t \in \mathcal{U} \},$$

that is, maps in  $C^{m,\alpha,\nu}$  which are  $\Phi_{\varepsilon}$ -invariant. We also denote  $C_G^{m,\alpha}(\partial\Omega_{\varepsilon};\mathbf{R}^n)$  for the space of  $\Phi_{\varepsilon}$  - invariant boundary data in  $C^{m,\alpha}(\partial\Omega_{\varepsilon};\mathbf{R}^n)$ .

Weighted Hölder spaces like above are now widely used for other nonlinear problems, see [9], [10], [4], [6], [8], [5], [3].

#### 3 Proof of the Theorem

In this section, we seek for a solution of (2) satisfying (3) by the same technique as in [9], [4], [6]: linearization and solving the appropriate fixed point problem. First, we construct the approximate solution. We fix  $\varepsilon > 0$ . Let  $v_0 : B_1^n(0) \to \mathbb{R}^n$  be the identity map  $v_0(x) = x$ ; so evidently  $\Gamma(v_0) = \{0\} \in \mathbb{R}^n$  and  $\Delta_{B^n} v_0 = 0$ , where  $\Delta_{B^n}$  means the Laplace operator on  $B_1^n(0)$ . Now we define the approximate solution  $u_{\varepsilon} : \Omega_{\varepsilon} \to \mathbb{R}^n$  by

$$u_{\varepsilon}(G_t^{\varepsilon}(\tilde{x})) = v_0(x)$$
 for  $x \in B_1^n(0)$ ,  $t \in \mathcal{U}$ 

where  $\tilde{x} = (x, 0) \in \tilde{\mathbf{B}}^n$ . By definition of  $\Omega_{\varepsilon}$  and by our assumption on the group action  $\Phi$ ,  $u_{\varepsilon}$  is well-defined and invariant under the action  $\Phi_{\varepsilon}$ . The zero set of  $u_{\varepsilon}$  satisfies  $\Gamma(u_{\varepsilon}) = \Gamma_{\varepsilon}$ .

We wish to find a solution of (2) of the form

$$U(u) = u_{\epsilon} + u$$

where the perturbation u is assumed to be invariant under the action  $\Phi_{\varepsilon}$  and to decay rapidly near  $\Gamma_{\varepsilon}$ , so as to ensure that  $\Gamma(U(u)) = \Gamma_{\varepsilon}$ .

Let N(u) be the left hand side of (2) for U(u), that is,

$$N(u) = \Delta U(u) + \lambda \varepsilon^{2} (1 - |U(u)|^{2}) U(u).$$

We make a Taylor expansion of N(u) about u = 0 to get

$$N(u) = N(0) + Lu + Q(u),$$

where

$$N(0) = \Delta u_{\varepsilon} + \lambda \varepsilon^{2} (1 - |u_{\varepsilon}|^{2}) u_{\varepsilon},$$

$$Lu = \frac{d}{dt} N(tu)|_{t=0}$$

$$= \Delta u + \lambda \varepsilon^{2} \left\{ (1 - |u_{\varepsilon}|^{2}) u - 2(u_{\varepsilon} \cdot u) u_{\varepsilon} \right\},$$

$$Q(u) = \int_{0}^{1} (1 - t) \frac{d^{2}}{dt^{2}} N(tu) dt$$

$$= (-2\lambda \varepsilon^{2}) \int_{0}^{1} (1 - t) \left\{ |u|^{2} u_{\varepsilon} + 2(u_{\varepsilon} \cdot u) u + 3t |u|^{2} u \right\} dt$$

$$= (-\lambda \varepsilon^{2}) \left\{ |u|^{2} u_{\varepsilon} + 2(u_{\varepsilon} \cdot u) u + |u|^{2} u \right\},$$

here  $\Delta$  means the Laplace operator on  $\Omega_{\varepsilon}$ . Now, if we define the linear operators

$$R = \Delta - \Delta_{B^n}$$

and

$$\xi u = \lambda \varepsilon^2 \left\{ (1 - |u_{\varepsilon}|^2) u - 2(u_{\varepsilon} \cdot u) u_{\varepsilon} \right\},\,$$

then the equation N(u) = 0 can be rewritten as

$$\Delta_{B^n} u = -N(0) - Ru - \xi u - Q(u) \tag{4}$$

which we solve by contraction mapping argument on some weighted Hölder space. Note that if u is invariant under the action  $\Phi_{\varepsilon}$ , all of the terms in (4) are also  $\Phi_{\varepsilon}$ -invariant, so we can consider (4) as a PDE on the slice  $\tilde{\mathbf{B}}^n$ . This is crucial for our subsequent arguments.

To estimate the terms in the right hand side of (4), we need the following lemma due to R.Mazzeo and N.Smale [5].

<u>Lemma1</u> Under the local coordination by F, we have

$$\Delta = \Delta_{B^n} + \Delta_{R^k} + e_1 \nabla^2 + e_2 \nabla, \tag{5}$$

where  $\Delta$  and  $\nabla$  are the Laplace operator and gradient on  $\Omega_{\epsilon}$ ,  $e_1 \in C^{\infty}((Sym^2\Omega_{\epsilon})^*)$ ,  $e_2 \in C^{\infty}(T^*\Omega_{\epsilon})$  are smooth sections and satisfy

$$\begin{aligned} |e_1(x,t)| &\leq C_0 r \varepsilon, & |e_2(x,t)| &\leq C_0 \varepsilon, \\ |e_1|_{(\alpha),[s,2s]} s^{\alpha} &\leq C_0 s \varepsilon, & |e_2|_{(\alpha),[s,2s]} s^{\alpha} &\leq C_0 \varepsilon \end{aligned}$$

for some constant  $C_0$  independent of  $\varepsilon > 0$  and  $\alpha \in (0,1)$ .

For functions u invariant under  $\Phi_{\epsilon}$ , the factor  $\Delta_{R^{k}}$  in (5) drops out. Using this lemma, we have

Lemma2 If  $\varepsilon > 0$ ,  $1 < \nu < 2$ , and  $u \in C_G^{2,\alpha,\nu}(\Omega_{\varepsilon}; \mathbf{R}^n)$ , then  $N(0), Ru, \xi u, Q(u)$  are all in  $C_G^{0,\alpha,\nu-2}(\Omega_{\varepsilon}; \mathbf{R}^n)$  and the following estimates hold:

$$\begin{array}{rcl} |N(0)|_{0,\alpha,\nu-2} & \leq & C_1 \varepsilon (1+|\lambda|\varepsilon), \\ |Ru|_{0,\alpha,\nu-2} & \leq & C_1 \varepsilon |u|_{2,\alpha,\nu}, \\ |\xi u|_{0,\alpha,\nu-2} & \leq & C_1 |\lambda|\varepsilon^2 |u|_{2,\alpha,\nu}, \\ |Q(u)|_{0,\alpha,\nu-2} & \leq & C_1 |\lambda|\varepsilon^2 \left(|u|_{2,\alpha,\nu}^2 + |u|_{2,\alpha,\nu}^3\right) \end{array}$$

for some constant  $C_1 > 0$  independent of  $\varepsilon$  and  $\lambda$ .

<u>Proof</u> Since  $u_{\epsilon}$  and u are  $\Phi_{\epsilon}$ -invariant, so are also all terms appeared in the right hand side of (4), and can be considered as functions of  $B_1^n(0)$ . By definition, the map  $u_{\epsilon}$  satisfies  $\Delta_{B^n}u_{\epsilon}=0$ , so we have

$$N(0) = \Delta u_{\varepsilon} + \lambda \varepsilon^{2} (1 - |u_{\varepsilon}|^{2}) u_{\varepsilon}$$
  
=  $(\Delta - \Delta_{B^{n}}) u_{\varepsilon} + \lambda \varepsilon^{2} (1 - |u_{\varepsilon}|^{2}) u_{\varepsilon}$ .

Then using Lemma 1 and the fact that  $|\nabla u_{\varepsilon}(x)| + |\nabla^2 u_{\varepsilon}(x)| \leq C$  and  $|u_{\varepsilon}(x)| \leq 1$  for some constant C independent of  $\varepsilon$  and  $x \in B_1^n(0)$ , we have

$$|N(0)(x)| \leq |e_1 \nabla^2 u_{\varepsilon}(x)| + |e_2 \nabla u_{\varepsilon}(x)| + |\lambda| \varepsilon^2 (1 - |u_{\varepsilon}|^2) |u_{\varepsilon}|$$
  
$$\leq Cs\varepsilon + C\varepsilon + |\lambda| \varepsilon^2$$

for  $s \le |x| \le 2s$ . Taking the supremum over the set  $\{x : s \le |x| \le 2s\}$  and multiplying  $s^{2-\nu}$ , we get

$$|N(0)|_{0,[s,2s]}s^{2-\nu} \leq s^{2-\nu} \cdot C\varepsilon(1+|\lambda|\varepsilon) \leq C\varepsilon(1+|\lambda|\varepsilon),$$

since  $1 < \nu < 2$  and  $0 < s \le 1/2$ . Hölder seminorm estimate for N(0) has the same form, then by taking the supremum over  $s \le 1/2$ , we have the first estimate of the lemma. Similarly by Lemma1,

$$Ru = (\Delta - \Delta_{B^n})u = e_1 \nabla^2 u + e_2 \nabla u,$$

so we have

$$|Ru|_{0,[s,2s]}s^{2-\nu} \leq Cs\varepsilon|\nabla^{2}u|_{0,[s,2s]}s^{2-\nu} + C\varepsilon|\nabla u|_{0,[s,2s]}s^{1-\nu} \cdot s \leq C\varepsilon\left(|\nabla^{2}u|_{0,[s,2s]}s^{2-\nu} + |\nabla u|_{0,[s,2s]}s^{1-\nu}\right),$$

for  $0 < s \le 1/2$ . Hölder seminorm estimate is also similar, then taking the supremum over  $s \le 1/2$  yields the estimate for Ru.

As for the estimates for  $\xi u$  and Q(u), by using the basic properties of the Hölder seminorm

$$|\mu + \eta|_{(\alpha)} \leq |\mu|_{(\alpha)} + |\eta|_{(\alpha)}$$

and

$$|\mu\eta|_{(\alpha)} \le |\mu|_{(0)} |\eta|_{(\alpha)} + |\mu|_{(\alpha)} |\eta|_{(0)},$$

as in the above computation, we can derive the following bounds:

$$|\xi u(x)| \le C|\lambda|\varepsilon^2|u(x)|, \quad x \in B_1^n(0)$$
 (6)

$$|\xi u|_{(\alpha),[s,2s]} \leq C|\lambda|\varepsilon^2 \left(|u|_{0,[s,2s]} + |u|_{(\alpha),[s,2s]}\right), \tag{7}$$

$$|Q(u)(x)| \le C|\lambda|\varepsilon^2(|u(x)|^2 + |u(x)|^3), \quad x \in B_1^n(0)$$
 (8)

$$|Q(u)|_{(\alpha),[s,2s]} \leq C|\lambda|\varepsilon^{2}\left(|u|_{0,[s,2s]}|u|_{(\alpha),[s,2s]}+|u|_{0,[s,2s]}^{2}+|u|_{0,[s,2s]}^{2}|u|_{(\alpha),[s,2s]}\right). (9)$$

If we multiply both sides of (6) and (8) by  $s^{2-\nu}$ , or of (7) and (9) by  $s^{2-\nu+\alpha}$  and take the supremum over  $s \le 1/2$ , we immediately have

$$\sup_{0 < s \le 1/2} \left( |\xi u|_{0,[s,2s]} s^{2-\nu} + |\xi u|_{(\alpha),[s,2s]} s^{2-\nu+\alpha} \right) \le C|\lambda|\varepsilon^2|u|_{0,\alpha,\nu}$$

$$\sup_{0 < s \le 1/2} \left( |Q(u)|_{0,[s,2s]} s^{2-\nu} + |Q(u)|_{(\alpha),[s,2s]} s^{2-\nu+\alpha} \right) \le C |\lambda| \varepsilon^2 \left( |u|_{0,\alpha,\nu}^2 + |u|_{0,\alpha,\nu}^3 \right)$$

which complete the proof of the lemma.

Now, to find solutions of (4), we first recall the unique solvability result for the linear problem  $\Delta_{B^n}u = f$  on  $B_1^n(0)$ , for  $f \in C_G^{0,\alpha,\nu-2}(\Omega_{\epsilon};\mathbf{R}^n)$  with some appropriate boundary conditions.

Let us take the sequence of eigenvalues of  $\Delta_{S^{n-1}}$  acting on  $C^{\infty}(S^{n-1}; \mathbf{R}^n)$ ,  $\mu_j$ ,  $0 = \mu_1 \leq \mu_2 \leq \cdots$ , (counting multiplicity),  $\mu_j \to \infty$ , and corresponding sequence of  $L^2$  normalized eigenmaps  $\phi_j \in C^{\infty}(S^{n-1}; \mathbf{R}^n)$  such that  $\Delta_{S^{n-1}}\phi_j + \mu_j\phi_j = 0$ ,  $j = 1, 2, \cdots$ . Let  $\lambda_j$  and  $\lambda_j(-)$  be two real solutions of the equation  $\lambda^2 + (n-2)\lambda - \mu_j = 0$ , that is

$$\lambda_j = \frac{2-n}{2} + \sqrt{\frac{(n-2)^2}{4} + \mu_j}$$
 and  $\lambda_j(-) = \frac{2-n}{2} - \sqrt{\frac{(n-2)^2}{4} + \mu_j}$ .

We now fix  $\nu$  so that  $1 < \nu < 2$  and choose an positive integer J such that  $\lambda_J < \nu < \lambda_{J+1}$ . For this J, we define

$$\Pi_J: L^2(S^{n-1}; \mathbf{R}^n) \to \{\phi_1, \phi_2, \cdots, \phi_J\}^{\perp}$$

be the orthogonal projection.

Then we have:

**Lemma3** If  $f \in C_G^{0,\alpha,\nu-2}(\Omega_{\varepsilon}; \mathbf{R}^n)$  and  $\psi \in C_G^{2,\alpha}(\partial \Omega_{\varepsilon}; \mathbf{R}^n)$  with  $0 < \alpha < 1$ , then there exists a unique  $u \in C_G^{2,\alpha,\nu}(\Omega_{\varepsilon}; \mathbf{R}^n)$  such that

$$\begin{cases}
\Delta_{B^n} u = f & \text{on } \Omega_{\varepsilon} \setminus \Gamma_{\varepsilon}, \\
\Pi_J(u|_{\partial \Omega_{\varepsilon}}) = \Pi_J(\psi).
\end{cases}$$
(10)

Furthermore, we have the estimate

$$|u|_{2,\alpha,\nu} \le C_2 (|f|_{0,\alpha,\nu-2} + |\psi|_{2,\alpha})$$

for some constant  $C_2$  depending only on  $\alpha$ .

<u>Proof</u> The proof of this is done by separation of variables and now quite standard (see [3], [9], [4], [6]), so we make only few comments.

If we write

$$\begin{split} u(r,\theta) &= \sum_{j=1}^{\infty} u_j(r)\phi_j(\theta), \quad u_j(r) = \langle u(r,\cdot),\phi_j(\cdot)\rangle_{L^2(S^{n-1};\mathbf{R}^n)}, \\ f(r,\theta) &= \sum_{j=1}^{\infty} f_j(r)\phi_j(\theta), \quad f_j(r) = \langle f(r,\cdot),\phi_j(\cdot)\rangle_{L^2(S^{n-1};\mathbf{R}^n)}, \\ \psi(\theta) &= \sum_{j=1}^{\infty} \psi_j\phi_j(\theta), \quad \psi_j = \langle \psi,\phi_j\rangle_{L^2(S^{n-1};\mathbf{R}^n)}, \end{split}$$

then each  $u_j$  must be the solution of the following ODE with boundary conditions:

$$\begin{cases} a''(r) + \frac{n-1}{r}a'(r) - \frac{\mu_j}{r^2} = f_j(r), \\ a(1) = \psi_j \quad \text{for} \quad j > J, \\ |a(r)| \le Cr^{\nu}. \end{cases}$$

By elementary ODE argument, Caffarelli, Hardt and Simon [3] showed that

$$u_{j}(r) = r^{\lambda_{j}} \int_{0}^{r} s^{1-n-2\lambda_{j}} \int_{0}^{s} \tau^{n-1+\lambda_{j}} f_{j}(\tau) d\tau ds, \quad (j = 1, 2, \dots, J)$$

$$u_{j}(r) = \psi_{j} r^{\lambda_{j}} - r^{\lambda_{j}} \int_{r}^{1} s^{1-n-2\lambda_{j}} \int_{0}^{s} \tau^{n-1+\lambda_{j}} f_{j}(\tau) d\tau ds, \quad (j \geq J+1)$$

are the unique solutions. Thus the map  $\sum_{j=1}^{\infty} u_j \phi_j$  formally solves the equation  $\Delta_{B^n} u = f$  on  $B_1^n(0)$  with  $\Pi_J(u|_{\partial\Omega_{\epsilon}}) = \Pi_J(\psi)$ , and in fact  $C^2$  classical sense on  $B_1^n(0) \setminus \{0\}$ .

To prove the estimate, note that we are dealing with the system of PDE, but in the same situation this was done in [4] using the local supremum estimates of [8] and the standard Schauder estimates in [7].

We now apply Lemma 2 and Lemma 3 to find fixed points of (4). Fix  $\alpha \in (0,1)$  and  $\nu \in (1,2)$  as before. For K > 0 and  $\varepsilon > 0$ , let us define

$$B_{K\varepsilon,\alpha,\nu} = \left\{ u \in C_G^{2,\alpha,\nu}(\Omega_\varepsilon; \mathbf{R}^n) : |u|_{2,\alpha,\nu} \le K\varepsilon \right\}.$$

Then we prove

**Lemma4** For any  $\lambda \in \mathbf{R}$ , there exists K > 0 and  $0 < \bar{\varepsilon} < 1$  such that if  $\varepsilon < \bar{\varepsilon}$ ,  $v \in B_{K\varepsilon,\alpha,\nu}$  and  $\psi \in C_G^{2,\alpha}(\partial \Omega_\varepsilon; \mathbf{R}^n)$  satisfying  $|\psi|_{2,\alpha} \le \varepsilon$ , then the problem: to find  $u \in B_{K\varepsilon,\alpha,\nu}$  such that

$$\begin{cases}
\Delta_{B^n} u = -N(0) - Rv - \xi v - Q(v) \\
\Pi_J(u|_{\partial\Omega_{\epsilon}}) = \Pi_J(\psi)
\end{cases}$$
(11)

has a unique solution.

<u>Proof</u> The problem above has a unique solution  $u \in C_G^{2,\alpha,\nu}(\Omega_{\varepsilon}; \mathbf{R}^n)$  by Lemma2 and Lemma3. Furthermore according to Lemma2, Lemma3 and  $|v|_{2,\alpha,\nu} \leq K\varepsilon$ , we have

$$|u|_{2,\alpha,\nu} \leq C_{2} (|\psi|_{2,\alpha} + |N(0)|_{0,\alpha,\nu-2} + |Rv|_{0,\alpha,\nu-2} + |\xi v|_{0,\alpha,\nu-2} + |Q(v)|_{0,\alpha,\nu-2})$$
  

$$\leq C_{2} (\varepsilon + C_{1}\varepsilon(1+|\lambda|\varepsilon) + C_{1}\varepsilon \cdot K\varepsilon + |\lambda|\varepsilon^{2} \cdot K\varepsilon + |\lambda|\varepsilon^{2} (K^{2}\varepsilon^{2} + K^{3}\varepsilon^{3}))$$
  

$$\leq C_{3} (\varepsilon + |\lambda|\varepsilon^{2} + K\varepsilon^{2} + |\lambda|\varepsilon^{2} (K\varepsilon + K^{2}\varepsilon^{2} + K^{3}\varepsilon^{3}))$$

for some constant  $C_3 > 0$ .

So, if we can take K and  $\varepsilon$  such that

$$C_3\left(\frac{1+|\lambda|\varepsilon}{K}+\varepsilon+|\lambda|\varepsilon^2\left(1+K\varepsilon+K^2\varepsilon^2\right)\right)\leq 1,$$

then the proof will be completed. This can be done as follows: First, fix K>0 sufficiently large so that

$$\frac{(1+|\lambda|)}{K} < \frac{1}{2C_2},$$

and then, fix  $\bar{\varepsilon} \in (0,1)$  sufficiently small so that

$$|\bar{\epsilon} + |\lambda|\bar{\epsilon}^2 \left(1 + K\bar{\epsilon} + K^2\bar{\epsilon}^2\right) < \frac{1}{2C_3}$$

П

Now, fix  $\psi \in C_G^{2,\alpha}(\partial \Omega_{\varepsilon}; \mathbf{R}^n)$  so that  $|\psi|_{2,\alpha} \leq \varepsilon(<\bar{\varepsilon})$ . Let us denote T(v) the unique solution of (11) for  $v \in B_{K\varepsilon,\alpha,\nu}$ . Then, by Lemma4, T defines a self-map of  $B_{K\varepsilon,\alpha,\nu}$ . To show that T is indeed a contraction, we need

Lemma 5 There is a constant  $C_4 > 0$  independent of  $u, v \in C_G^{2,\alpha,\nu}(\Omega_{\epsilon}; \mathbf{R}^n)$ ,  $\epsilon$  and  $\lambda$  such that

$$|Q(u) - Q(v)|_{0,\alpha,\nu-2} \le C_4 |\lambda| \varepsilon^2 |u - v|_{2,\alpha,\nu} \left[ |u|_{2,\alpha,\nu} + |v|_{2,\alpha,\nu} + (|u|_{2,\alpha,\nu} + |v|_{2,\alpha,\nu})^2 \right]$$
holds,

<u>Proof</u> This is obtained quite easily by elementary computation and basic property of Hölder seminorms, if we write

$$Q(u) - Q(v) = (-\lambda \varepsilon^2) (I_1 + 2I_2 + I_3),$$

where

$$I_{1} = [(u-v)\cdot(u+v)] u_{\varepsilon},$$

$$I_{2} = (u_{\varepsilon}\cdot u)(u-v) + [u_{\varepsilon}\cdot(u-v)] v,$$

$$I_{3} = |u|^{2}(u-v) + [(u-v)\cdot(u+v)] v.$$

Let  $u_1 = T(v_1)$  and  $u_2 = T(v_2)$  are the unique solution of (11) for fixed  $\psi$ , given by Lemma 4. Then by Lemma 3, Lemma 2 and Lemma 5, we have

$$\begin{split} |T(v_{1}) - T(v_{2})|_{2,\alpha,\nu} \\ &\leq C_{2}|R(v_{1} - v_{2})|_{0,\alpha,\nu-2} + C_{2}|\xi(v_{1} - v_{2})|_{0,\alpha,\nu-2} + C_{2}|Q(v_{1}) - Q(v_{2})|_{0,\alpha,\nu-2} \\ &\leq C_{2}C_{1}\varepsilon|v_{1} - v_{2}|_{2,\alpha,\nu} + C_{2}C_{1}|\lambda|\varepsilon^{2}|v_{1} - v_{2}|_{2,\alpha,\nu} \\ &+ C_{2}C_{4}|\lambda|\varepsilon^{2}|v_{1} - v_{2}|_{2,\alpha,\nu} \left[|v_{1}|_{2,\alpha,\nu} + |v_{2}|_{2,\alpha,\nu} + (|v_{1}|_{2,\alpha,\nu} + |v_{2}|_{2,\alpha,\nu})^{2}\right] \\ &\leq C_{5}\left[\varepsilon + |\lambda|\varepsilon^{2} + |\lambda|\varepsilon^{2}\left(K\varepsilon + K^{2}\varepsilon^{2}\right)\right]|v_{1} - v_{2}|_{2,\alpha,\nu}. \end{split}$$

So if we retake  $\bar{\varepsilon}$  small enough so that  $C_5\left[\bar{\varepsilon} + |\lambda|\bar{\varepsilon}^2 + |\lambda|\bar{\varepsilon}^2 \left(K\bar{\varepsilon} + K^2\bar{\varepsilon}^2\right)\right] < 1$ , the map T defines a contraction on the closed subset of a complete metric space, then it has a fixed point u. Thus we have found a map  $U = u + u_{\varepsilon}$  satisfying (2), at least in  $\Omega_{\varepsilon} \setminus \Gamma_{\varepsilon}$ .

point u. Thus we have found a map  $U=u+u_{\varepsilon}$  satisfying (2), at least in  $\Omega_{\varepsilon}\setminus\Gamma_{\varepsilon}$ . Note that when  $1<\nu<2$ , we can extend  $u\in C^{2,\alpha,\nu}_{G}(\Omega_{\varepsilon};\mathbf{R}^{n})$  (as thought of a map defined on  $B^{n}_{1}(0)\setminus\{0\}$ ) to  $0\in B^{n}_{1}(0)$  so that u(0)=0 and  $|\nabla u(0)|=0$ , then the map U is indeed a smooth solution of (2) on each fibers of  $\Omega_{\varepsilon}$ . Moreover if we require  $\bar{\varepsilon}$  small enough such that  $K\bar{\varepsilon}\leq 1/2$ , then  $|U(x)|\geq |u_{\varepsilon}(x)|-|u(x)|\geq (1/2)|x|$  for any  $x\in B^{n}_{1}(0)$ , so  $\Gamma(U)=\Gamma(u_{\varepsilon})=\Gamma_{\varepsilon}$ . As noted earlier, simple rescaling by a factor of  $\varepsilon$  completes the proof of Theorem.
