THE EXTENT OF STRENGTH IN THE CLUB FILTERS

DOUGLAS R. BURKE AND YO MATSUBARA

1. INTRODUCTION

This paper gives a number of partial results towards the following conjectures. Unless otherwise noted, $\kappa$ is a regular, uncountable cardinal and $\lambda$ is an infinite cardinal ($\lambda \geq \kappa$).

Conjecture 1. The club filter on $\mathcal{P}_{\kappa}\lambda$ is not precipitous — unless $\lambda$ is regular.

Conjecture 2. The club filter on $\mathcal{P}_{\kappa}\lambda$ is not pre-saturated — unless $\kappa = \aleph_1$ and $\lambda$ is regular or $\kappa = \lambda$ is weakly inaccessible.

The corresponding conjecture for saturation has been established by Foreman and Magidor:

Theorem (Foreman-Magidor). The club filter on $\mathcal{P}_{\kappa}\lambda$ is not saturated — unless $\kappa = \lambda = \aleph_1$.

The results of section 2 of this paper are the authors' partial results towards the above theorem. Shortly after the results of this paper were announced, Foreman and Magidor proved the above theorem. Their proof does not use any of the results of this paper, and in fact in the case covered by Theorem 2.10, they establish the stronger result that the club filter is not even $\lambda^{++}$ saturated.

Remarks. 1. [She87] It is consistent that the club filter on $\aleph_1$ is saturated (assuming the consistency of a Woodin cardinal).

2. [Git95] It is consistent that the club filter on $\kappa$, $\kappa$ weakly inaccessible, is pre-saturated (assuming the consistency of an up-repeat point).

3. [Gol92] If $\delta$ is Woodin then for every regular $\lambda$ ($\aleph_1 \leq \lambda < \delta$), $V^{Col(\lambda, \delta)} \models$ "the club filter on $\mathcal{P}_{\aleph_1}\lambda$ is pre-saturated".

4. [Gol] If $\delta$ is Woodin then for every regular $\kappa < \lambda$ ($\aleph_1 \leq \kappa \leq \lambda < \delta$), $V^{Col(\lambda, \delta)} \models$ "the club filter on $\mathcal{P}_{\kappa}\lambda$ is precipitous".

Date: August 12, 1997.
The first author was partially supported by NSF grant DMS-9626212.
We now give our basic definitions and conventions. \( \mathcal{F} \) is a normal filter on \( \mathcal{P}(\lambda) \) if

1. \( \mathcal{F} \subseteq \mathcal{P}(\lambda) \) is a filter.
2. (fine) \( \forall a \in \lambda \{ a \subseteq \lambda \mid \alpha \in a \} \in \mathcal{F} \).
3. (normal) If \( C_\alpha \in \mathcal{F} (\alpha \in \lambda) \), then \( \{ a \subseteq \lambda \mid \forall \alpha \in a (a \in C_\alpha) \} \in \mathcal{F} \).

Throughout this paper, filter will mean normal filter. \( \mathcal{F}^+ = \text{def} \{ A \subseteq \mathcal{P}(\lambda) \mid \forall C \in \mathcal{F} (C \cap A \neq \emptyset) \} \). \( \mathcal{F}^+ \) has an associated partial ordering: \( A \leq B \iff A \subseteq B \).

A filter \( \mathcal{F} \) on \( \mathcal{P}(\lambda) \) is saturated if every antichain in \( \mathcal{F}^+ \) has size \( \leq \lambda \). \( \mathcal{F} \) is pre-saturated if given antichains \( A_\alpha (\alpha < \lambda) \) and \( S \in \mathcal{F}^+ \), there is a \( T \leq S \) such that for all \( \alpha < \lambda, \{ A \in A_\alpha \mid A \cap T \in \mathcal{F}^+ \} \leq \lambda \).

Forcing with \( \mathcal{F}^+ \) extends \( \mathcal{F} \) to a \( V \)-normal, \( V \)-ultrafilter \( \mathcal{G} \) — so we get a generic embedding \( j : V \rightarrow \text{Ult}(V, \mathcal{G}) \subseteq V[\mathcal{G}] \).

\( \mathcal{F} \) is precipitous if this ultrapower is always well-founded. If \( \mathcal{F} \) is pre-saturated, then \( \mathcal{F} \) is precipitous and the ultrapower is closed under \( \lambda \) sequences in \( V[\mathcal{G}] \). For more on the basic facts about generic embeddings see [For86].

The club filter on \( \mathcal{P}(\lambda) \) (\( \text{CF}_{\mathcal{P}(\lambda)} \) or just \( \text{CF} \)) consists of all \( A \subseteq \mathcal{P}(\lambda) \) such that \( \exists f : \lambda^{<\omega} \rightarrow \lambda \) with \( \text{cl}_f \subseteq A \) (\( \text{cl}_f = \{ a \subseteq \lambda \mid f''a^{<\omega} \subseteq a \} \)). Sets in \( \text{CF}^+ \) are called stationary. \( \text{CF} \) is the smallest normal filter on \( \mathcal{P}(\lambda) \).

If \( S \in \mathcal{F}^+ \), then \( \mathcal{F} \upharpoonright S = \text{def} \{ A \subseteq \mathcal{P}(\lambda) \mid (\exists C \in \mathcal{F}) C \cap S \subseteq A \} \) is a normal filter. If \( S \in \text{CF}^+ \), then the club filter on \( S \), \( \text{CF} \upharpoonright S \), is the smallest normal filter on \( \mathcal{P}(\lambda) \) containing \( S \).

\( \mathcal{P}_\kappa \lambda = \text{def} \{ a \subseteq \lambda \mid |a| < \kappa \wedge a \cap \kappa \in \kappa \} \). This definition is slightly non-standard: usually the condition "\( a \cap \kappa \in \kappa \)" is dropped. The set \( \mathcal{P}_\kappa \lambda \) is stationary in \( \mathcal{P}(\lambda) \). If \( \mathcal{F} \) is a filter on \( \mathcal{P}(\lambda) \) and \( \mathcal{P}_\kappa \lambda \in \mathcal{F} \), then \( \mathcal{F} \) is \( \kappa \)-complete, and so \( \forall S \in \mathcal{P}_\kappa \lambda, \{ a \in \mathcal{P}_\kappa \lambda \mid s \subseteq a \} \in \mathcal{F} \).

If \( a \subseteq \text{Ord} \), then \( \text{cof}(a) \) is the cofinality of the order type of \( a \). A \( \phi_{\kappa, \lambda} \) sequence is a set \( \{ s_\alpha \subseteq a : a \in \mathcal{P}_\kappa \lambda \} \) such that for all \( A \subseteq \lambda \), \( \{ a \in \mathcal{P}_\kappa \lambda \mid a \cap A = s_\alpha \} \) is stationary.

The following fact was proved in [BTW77] for filters on cardinals. A similar proof works here.

**Fact 1.1.** Assume \( \mathcal{F} \) is a filter on \( \mathcal{P}(\lambda) \). \( \mathcal{F} \) is saturated iff for all filters \( \mathcal{G} \supseteq \mathcal{F}, \exists S \in \mathcal{F}^+ \) such that \( \mathcal{G} = \mathcal{F} \upharpoonright S \).

**Corollary 1.2.** Suppose the club filter on \( S \) is saturated. Then every filter on \( S \) is saturated.
2. Saturation

One of the first results about the failure of saturation is a theorem of Shelah ([She82], p. 440) that says, for example, if $\mathcal{F}$ is a saturated filter on $\omega_2$, then \{ $\alpha < \omega_2 \mid \text{cof}(\alpha) = \omega_1$ \} $\in \mathcal{F}$. The proof of this uses the following result (with $\lambda = \omega_2$). We also use this result to get similar facts about saturated filters on $\mathcal{P}_\kappa \lambda$.

**Theorem 2.1.** ([She82],[Cum97]) Assume $V \subseteq W$ are inner models of $\text{ZFC}$, $\lambda$ is a cardinal of $V$, $\rho$ is a cardinal of $W$, and $\lambda^+_V = \rho^+_W$.

Assuming (*), $W \models \text{cof}(\lambda) = \text{cof}(\rho)$.

(*) $\lambda$ is regular, or ($\lambda$ is singular and) there is a good scale on $\lambda$, or ($\lambda$ is singular and) $W$ is a $\lambda^+$-cc forcing extension of $V$.

See the next section for the definition of good scale.

**Definition 2.2.** $S_\lambda = \text{def} \{ a \subseteq \lambda \mid \text{cof}(a) = \text{cof}(|a|) \}$. 

**Theorem 2.3.** Assume $\mathcal{F}$ is a saturated filter on $\mathcal{P}(\lambda)$. Then $S_\lambda \in \mathcal{F}$. 

**Proof.** Suppose not. So we get $j : V \to M \subseteq V[G]$ with $\mathcal{P}(\lambda) \setminus S_\lambda \in G$. Since $\mathcal{P}(\lambda) \setminus S_\lambda \in G$, $M \models \text{cof}(\lambda) \neq \text{cof}(|\lambda|)$. Since $M^\lambda \subseteq M$ in $V[G]$, $V[G] \models \text{cof}(\lambda) \neq \text{cof}(|\lambda|)$. This contradicts Theorem 2.1 since $V[G]$ is a $\lambda^+$-cc generic extension of $V$. 

**Lemma 2.4.** Assume $\kappa = \rho^+$, $\text{cof}(\lambda) < \kappa$, and $\text{cof}(\lambda) \neq \text{cof}(\rho)$. Then $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is non-stationary. 

**Proof.** Let $a \in \mathcal{P}_\kappa \lambda$. On a club, $|a| = \rho$ and so $\text{cof}(|a|) = \text{cof}(\rho)$. Since $\text{cof}(\lambda) < \kappa$, on a club $\text{sup}(a) = \lambda$ and so $\text{cof}(a) = \text{cof}(\lambda)$. Therefore $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is non-stationary. 

**Corollary 2.5.** For $\kappa$, $\lambda$ as above, there is no saturated filter on $\mathcal{P}_\kappa \lambda$.

**Remark.** If $\kappa = \rho^+$ and $\text{cof}(\lambda) = \text{cof}(\rho)$, then $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is club in $\mathcal{P}_\kappa \lambda$.

**Lemma 2.6.** Assume $\kappa = \rho^+ \geq \aleph_2$ and $\text{cof}(\lambda) \geq \kappa$. Then $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is stationary, co-stationary in $\mathcal{P}_\kappa \lambda$.

**Proof.** Let $f : \lambda^{<\omega} \to \lambda$. We may assume $a \in \mathcal{P}_\kappa \lambda \cap \text{cl}_f$ implies $\text{cof}(|a|) = \text{cof}(\rho)$. For any regular $\delta < \kappa$ we can build a continuous increasing chain of length $\delta$ to find $a \in \mathcal{P}_\kappa \lambda$ closed under $f$ with $\text{cof}(a) = \delta$. Taking $\delta = \text{cof}(\rho)$ shows that $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is stationary. Taking $\delta \neq \text{cof}(\rho)$ shows that $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is co-stationary in $\mathcal{P}_\kappa \lambda$. 

**Corollary 2.7.** For $\kappa$, $\lambda$ as above, the club filter on $\mathcal{P}_\kappa \lambda$ is not saturated.

**Remark.** If $\kappa = \aleph_1$, then for all $\lambda \geq \kappa$, $S_\lambda \cap \mathcal{P}_\kappa \lambda$ is club in $\mathcal{P}_\kappa \lambda$. 

---

**THE EXTENT OF STRENGTH IN THE CLUB FILTERS**
**Lemma 2.8.** Assume $\kappa$ is a regular limit cardinal and $\text{cof}(\lambda) \neq \kappa$. Then $S_\lambda \cap P_\kappa \lambda$ is stationary, co-stationary in $P_\kappa \lambda$.

**Proof.** Let $f : \lambda^{<\omega} \to \lambda$ and $\rho < \kappa$ a regular cardinal. It is easy to find $a \in P_\kappa \lambda \cap \text{cl}_f$ such that $|a| = |a \cap \kappa|$ and $\text{cof}(|a \cap \kappa|) = \rho$ and, if $\text{cof}(\lambda) > \kappa$, $\text{cof}(a) = \rho$ (if $\text{cof}(\lambda) < \kappa$, then for club many $a \in P_\kappa \lambda$, $\text{cof}(a) = \text{cof}(\lambda)$). Hence $S_\lambda \cap P_\kappa \lambda$ is stationary (take $\rho = \text{cof}(\lambda)$ if $\text{cof}(\lambda) < \kappa$). If $\text{cof}(\lambda) < \kappa$ then $S_\lambda \cap P_\kappa \lambda$ is co-stationary in $P_\kappa \lambda$—take $\rho \neq \text{cof}(\lambda)$. Finally, assume $\text{cof}(\lambda) > \kappa$. The idea for the following argument is from [Bau91]. Let $\delta = \text{cof}(\lambda)$. Note that 

\[
\{ a \in P_\kappa \lambda \mid \text{cof}(a) = \text{cof}(a \cap \delta) \}
\]

is club, so we may assume $f$ witnesses this. Let $f : \delta^{<\omega} \to \delta$ be such that $a \in \text{cl}_f$ implies $\text{cl}_f(a) \cap \delta = a$. Define $g : \delta \to \delta$ by $g(\alpha) = \sup(\text{cl}_f(\alpha + 1))$. Now choose $a \in P_\kappa \delta$ such that $a \in \text{cl}_f$, $a \in \text{cl}_g$, $|a| = |a \cap \kappa|$, $\text{cof}(|a \cap \kappa|) = \aleph_1$, $\text{cof}(a) = \aleph_1$, and $\kappa \in a$. Let $a_0 = a \cap \kappa$. Given $a_\alpha$, let $\beta \in a \setminus \sup(a_\alpha)$, and $a_{\alpha+1} = \text{cl}_f(a_\alpha \cup \{\beta\})$. Let $a_\omega = \bigcup_{n \in \omega} a_n$. Then $a_\omega \cap \kappa = a \cap \kappa$, $a_\omega \in \text{cl}_f$ and $\text{cof}(a_\omega) = \omega$. Let $b = \text{cl}_f(a_\omega)$. Then $b \in \text{cl}_f$ and $\text{cof}(|b|) = \aleph_1$ and $\text{cof}(b) = \omega$. Hence $S_\lambda \cap P_\kappa \lambda$ is co-stationary in $P_\kappa \lambda$. \qed

**Corollary 2.9.** For $\kappa$, $\lambda$ as above, the club filter on $P_\kappa \lambda$ is not saturated.

**Remark.** Assume $\text{cof}(\lambda) = \kappa$ ($\kappa$ regular limit). Then for club many $a \in P_\kappa \lambda$, $\text{cof}(a) = \text{cof}(a \cap \kappa)$. So $S_\lambda$ is club in the (stationary) set

\[
\{ a \in P_\kappa \lambda \mid |a| = |a \cap \kappa| \}
\]

and is non-stationary in the (possibly non-stationary) set

\[
\{ a \in P_\kappa \lambda \mid |a| = |a \cap \kappa|^{+} \}.
\]

The above method does not handle the cases: (i) $\kappa = \aleph_1$, (ii) $\kappa = \rho^+$ and $\text{cof}(\lambda) = \text{cof}(\rho)$, and (iii) $\kappa$ regular limit and $\text{cof}(\lambda) = \kappa$. Case (ii) is handled in the following:

**Theorem 2.10.** Assume $\text{cof}(\lambda) < \kappa$ and $\kappa \geq \aleph_2$. Then the club filter on $P_\kappa \lambda$ is not saturated.

**Proof.** Let $\langle f_\alpha : \alpha \in \lambda^+ \rangle$ be a scale on $\lambda$ (see definition 3.3, so each $f_\alpha \in \Pi_{\xi < \text{cof}(\lambda)} \rho_\xi$, where the $\rho_\xi$'s are an increasing sequence of regular cardinals cofinal in $\lambda$ with $\kappa < \rho_0$). Given $a \in P_\kappa \lambda$ define $g_\alpha \in \Pi \rho_\xi$ by $g_\alpha(\xi) = \sup(a \cap \rho_\xi)$ and let $\pi(a) = \text{least } \alpha \in \lambda^+ \text{ such that } g_\alpha \leq^* f_\alpha$.

Let $F$ be a filter on $P_\kappa \lambda$. Let $\theta >> \lambda$, and assume $F_\theta$ is a filter on $P_\kappa H_\theta$ projecting to $F$. Let

\[
E = \{ b \in H_\theta \mid b \in P_\kappa H_\theta \& \langle f_\alpha : \alpha \in \lambda^+ \rangle \in b \& 
\text{cof}(\lambda) \subseteq b \& \langle \rho_\xi : \xi < \text{cof}(\lambda) \rangle \in b \}.
\]

**Claim 1.** If $b \in E$ then $\sup(b \cap \lambda^+) \leq \pi(b \cap \lambda)$. 

THE EXTENT OF STRENGTH IN THE CLUB FILTERS

Suppose not. Let \( b \in E \) with \( \sup(b \cap \lambda^+) > \pi(b \cap \lambda) \). Say \( \beta \in b \cap \lambda^+ \) with \( \beta > \xi \). But \( f_{\beta}^* > f_{\xi}^* \geq g_{\beta \lambda} \). Therefore \( \exists \eta < \text{cof}(\lambda) \) such that \( f_{\beta}(\eta) > f_{\alpha}(\eta) \geq g_{\beta \lambda}(\eta) \). But \( \text{cof}(\lambda) \subseteq b \), \( \beta \in b \), and \( \{ f_{\alpha} : \alpha \in \lambda^+ \} \subseteq b \). Therefore \( f_{\beta}(\eta) \in b \cap \rho_{\eta} \). But \( g_{\beta \lambda}(\eta) = \sup(b \cap \rho_{\eta}) \). Contradiction.

Let \( T \in \mathcal{F}_{\theta} \) and define \( S_T(a) = \sup\{ \sup(b \cap \lambda^+) \mid b \cap \lambda = a \cap b \in T \} \).

Note that \( S_T \) is defined on a set in \( \mathcal{F} \) (the projection of \( T \)), if \( T \subseteq T' \) then \( S_T(a) \leq S_{T'}(a) \), and if \( T \subseteq E \) then \( S_T(a) \leq \pi(a) \).

Claim 2. Given \( \beta \in \lambda^+ \) and \( T' \subseteq E \) with \( T \in \mathcal{F}_{\theta} \), on an \( \mathcal{F} \) measure one set we have \( \beta < S_T(a) \leq \pi(a) < \lambda^+ \).

We already have that \( S_T \) is defined on an \( \mathcal{F} \) measure one set and \( S_T(a) \leq \pi(a) < \lambda^+ \). Let \( \beta \in \lambda^+ \) and let \( T' = \{ b \in T \mid \beta \in b \} \).

Then \( T' \in \mathcal{F}_{\theta} \) and (on the projection of \( T' \)) \( S_{T'}(a) > \beta \) and \( S_{T'}(a) \leq S_T(a) \).

Claim 3. Assume \( f : P_{\kappa}\lambda \rightarrow \lambda^+ \) is such that \( \mathcal{M} \_f^+ \}[f] = \sup f^* \lambda^+ \).

Then there is a \( T \in \mathcal{F}_{\theta} \) such that \( (\forall T' \subseteq T) \ T' \in \mathcal{F}_{\theta} \) on a set in \( \mathcal{F} \), \( S_{T'}(a) = f(a) \).

On an \( \mathcal{F}_{\theta} \) measure one set \( f(b \cap \lambda) \geq \sup(b \cap \lambda^+) \) (If not, then there is a \( S \in \mathcal{F}_{\theta}^+ \) such that \( f(b \cap \lambda) < \sup(b \cap \lambda^+) \), so on some \( S' \in \mathcal{F}_{\theta}^+ \), \( f(b \cap \lambda) < \eta \) (\( \eta \in \lambda^+ \) is fixed). Projecting to \( \mathcal{F} \) we get \( S' \in \mathcal{F}_{\theta}^+ \) such that \( f(b) < \eta \) on \( S' \). Contradiction.)

So let \( T \in \mathcal{F}_{\theta} \) such that \( T' \subseteq E \) and \( (\forall b \in T) \ f(b \cap \lambda) \geq \sup(b \cap \lambda^+) \). Therefore, on an \( \mathcal{F} \) measure one set, \( f(a) \geq S_T(a) \). Suppose on \( S \in \mathcal{F}^+ \) we have \( f(a) > S_T(a) \). Then since \( \mathcal{M} \_f^+ \}[f] = \sup f^* \lambda^+ \), there exists \( S \subseteq S \) and \( \eta < \lambda^+ \) such that on \( S \), \( S_T(a) \leq \eta \). This contradicts Claim 2. Finally, assume \( T' \subseteq T \). Then on \( \mathcal{F} \) measure one set \( S_{T'}(a) \leq S_T(a) = f(a) \). Again by Claim 2, \( S_{T'}(a) = f(a) \) on an \( \mathcal{F} \) measure one set.

Claim 4. Assume \( \rho < \kappa \) is regular, \( \rho \neq \text{cof}(\lambda) \), \( T \subseteq P_{\kappa}H_{\theta} \) is stationary, \( T \subseteq E \), and \( \forall a \in T \), \( a \) is IA (internally approachable) of length \( \rho \) (this means there is an increasing, continuous sequence \( \{ a_{\xi} : \xi < \rho \} \) where each \( a_{\xi} \in E \), \( \forall \rho' < \rho \), \( a_{\xi} : \xi < \rho \) \( \subseteq a \), and \( a = \cup_{\xi<\rho}a_{\xi} \). —see [FM97].

Let \( \mathcal{T} \) be the projection of \( T \) to \( P_{\kappa}\lambda \). Then for all \( a \in \mathcal{T} \) \( S_T(a) = \pi(a) \) and \( \text{cof}(\pi(a)) = \rho \).

The idea for the proof of Claim 4 comes from [FM97]. Let \( b \in T \), and \( \{ b_{\alpha} : \alpha < \rho \} \) be a witness to IA of length \( \rho \). We may assume \( (\forall \alpha \in \rho) \ b_{\alpha} \in b_{\alpha+1} \). Let \( a = b \cap \lambda \). It is enough to see that \( \sup(b \cap \lambda^+) = \pi(a) \). (Note that \( \text{cof}(\sup(b \cap \lambda^+)) = \rho \).) Given \( \alpha < \rho \)
we have ($\forall f \in b_0$) $f < g_{b_0}$ (everywhere) and since $g_{b_0} \in b_{\alpha+1}$, there is $\gamma_{\alpha} \in b_{\alpha+1}$ such that $g_{b_0} \leq^{*} f_{\gamma_{\alpha}}$. By Claim 1, $\pi(a) \geq \sup(b \cap \lambda^+)$. So let $\delta = \sup(b \cap \lambda^+)$ and we will show $g_{b} \leq^{*} f_{\delta}$. For all $\alpha < \rho$, $g_{b_{\alpha}} \leq^{*} f_{\gamma_{\alpha}} <^{*} f_{\delta}$. Since $\rho \neq \text{cof}(\lambda)$, $\exists A \subseteq \rho$ unbounded and $\nu < \text{cof}(\lambda)$ such that $\forall \alpha \in A$ and $\forall \xi \in (\nu, \text{cof}(\lambda))$ $g_{b_{\alpha}}(\xi) < f_{\delta}(\xi)$.

But $g_{b}(\xi) = \sup_{\alpha \in A} g_{b_{\alpha}}(\xi)$ and so $g_{b}(\xi) \leq f_{\delta}(\xi)$.

Let $\rho < \kappa$ be regular, $\rho \neq \text{cof}(\lambda)$.

Let $T = \{ b \in E \mid b \text{ is IA of length } \rho \}$.

Claim 5. $T$ is stationary.

Let $f : H_{\theta}^{<\omega} \rightarrow H_{\theta}$. Let $b_0 \in E \cap \text{cl}_f$. If $\xi < \rho$ is limit let $b_{\xi} = \bigcup_{\varepsilon < \xi} b_{\varepsilon}$. Given $b_{\xi}$, let $b_{\xi+1} \in E \cap \text{cl}_f$ such that $b_{\xi} \cup \{(b_{\varepsilon} : \varepsilon \leq \xi)\} \in b_{\xi+1}$. So $b = \bigcup_{\varepsilon < \rho} b_{\varepsilon} \in E \cap \text{cl}_f$. To see $b$ is IA of length $\rho$ we just need $\forall \xi < \rho \langle b_{\alpha} : \alpha \in \xi \rangle \in b$. But $\langle b_{\alpha} : \alpha \in \xi \rangle \in b_{\xi+1} \subseteq b$.

Finally, let $\mathcal{F}_\theta = \text{CF} \upharpoonright T$. $\mathcal{F}$ is gotten by projection. We will show that $\mathcal{F}$ is not saturated, and therefore by Corollary (1.2) the club filter on $\mathcal{P}_\kappa \lambda$ is not saturated.

For a contradiction, assume $\mathcal{F}$ is saturated. So there is an $f : \mathcal{P}_\kappa \lambda \rightarrow \lambda^+$ such that $\vdash \langle [f] \rangle = \sup j'' \lambda^+$, and on a set in $\mathcal{F}$, $\text{cof}(f(a)) > \rho$ (otherwise we could force to have $\text{cof}([f]) \leq \rho$ in the ultrapower—so this collapses $\lambda^+$).

By Claim 3, $\exists R \in \mathcal{F}_\theta$ such that for any $R' \subseteq R$ ($R' \in \mathcal{F}_\theta$) on a set in $\mathcal{F}$, $S_{R'}(a) = f(a)$. So on a set in $\mathcal{F}$, $S_{R \cap T}(a) = f(a)$. But $R \cap T$ is a set as in Claim 4. Hence on a set in $\mathcal{F}$ (the projection of $R \cap T$) $S_{R \cap T}(a) = \pi(a)$ and $\text{cof}(\pi(a)) = \rho$. Therefore on a set in $\mathcal{F}$, $\text{cof}(f(a)) = \rho$. This contradiction completes the proof.

Question. In the above proof, $\mathcal{F}$ is the projection of $\text{CF} \upharpoonright T$. Is $\mathcal{F}$ the club filter restricted to a stationary set?

We conclude this section with three previously known theorems.

Theorem 2.11. ([GS97]) For all $\kappa > \aleph_1$, the club filter on $\kappa$ is not saturated. In fact, for any regular $\rho$ with $\rho^+ < \kappa$, $\text{CF} \upharpoonright \{ \alpha < \kappa \mid \text{cof}(\alpha) = \rho \}$ is not saturated.

Corollary 2.12. For all regular $\kappa$ and all regular $\lambda \geq \aleph_2$, the club filter on $\mathcal{P}_\kappa \lambda$ is not saturated.

Proof. Define $g : \mathcal{P}_\kappa \lambda \rightarrow \lambda$ by $g(a) = \sup(a)$. Suppose $S \subseteq \lambda$ is stationary and ($\forall \alpha \in S$) $\text{cof}(\alpha) < \kappa$. Then $g^{-1}(S)$ is stationary (let $f : \lambda^{<\omega} \rightarrow \lambda$ and choose $\alpha \in S$ such that $\alpha$ is closed under $f$. Now build $a \in \mathcal{P}_\kappa \lambda \cap \text{cl}_f$ such that $\sup(a) = \alpha$. Also, if $S \subseteq \mathcal{P}_\kappa \lambda$ is stationary, then $g'' S \subseteq \lambda$ is stationary (if $f : \lambda^{<\omega} \rightarrow \lambda$, define $h(\alpha) = \text{cl}_f(\alpha + 1)$.}
THE EXTENT OF STRENGTH IN THE CLUB FILTERS

If $a \in S \cap \text{cl}_h$, then $\sup(a)$ is closed under $f$. The result now follows from Theorem 2.11.

\textbf{Theorem 2.13.} [DM93] If $\lambda > 2^{<\kappa}$ then $o_{\kappa,\lambda}$ holds. Hence the club filter on $\mathcal{P}_\kappa \lambda$ is not saturated.

\textbf{Theorem 2.14.} [BT82] For any $\lambda > \aleph_1$, $\mathcal{P}_{\aleph_1} \lambda$ can be split into $2^\omega$ many disjoint stationary sets.

\textit{Remark.} Piecing everything together, we have the following partial results towards the theorem of Foreman and Magidor: The club filter on $\mathcal{P}_\kappa \lambda$ is not saturated unless

1. $\kappa = \lambda = \aleph_1$ (consistent).
2. $\kappa = \aleph_1$, $\lambda = 2^\omega$ is singular.
3. $\kappa$ is limit and $\text{cof}(\lambda) = \kappa$ and $2^{<\kappa} \geq \lambda$.

3. CARDINAL PRESERVING TO PRE-SATURATION

A filter $\mathcal{F}$ on $\mathcal{P}(\lambda)$ is \textit{weakly pre-saturated} if $\mathcal{F}$ is precipitous and $\models_{\mathcal{F}^+} \lambda^+$ is preserved. The filter $\mathcal{F}$ is called \textit{cardinal preserving} if $\models_{\mathcal{F}^+} \lambda^+$ is preserved. If $|\mathcal{F}^+| = \lambda^+$, then pre-saturated, weakly pre-saturated and cardinal preserving are all equivalent. It is not known if they are equivalent in general.

We use a number of known combinatorial principles to get that the club filter cannot have these strong properties. For the case $\lambda$ regular, the solution is complete—the club filter on $\mathcal{P}_\kappa \lambda$ is not cardinal preserving unless $\kappa = \aleph_1$ or $\kappa = \lambda$ is weakly inaccessible (and both these cases are consistent).

\textbf{Definition 3.1.} $Sh(\lambda)$ means for any $\mathbb{P} \in V$, if $V^\mathbb{P} \models \text{cof}(\lambda) \neq \text{cof}(|\lambda|)$, then $V^\mathbb{P} \vdash_{\tau} \lambda^+$.

\textbf{Definition 3.2.} $AD(\lambda)$ means $\exists (a_\alpha : \alpha \in \lambda^+)$ such that each $a_\alpha$ is an unbounded subset of $\lambda$ and $\forall \alpha \in \lambda^+$ $\exists \alpha \rightarrow \lambda$ such that $\beta_1 < \beta_2 < \alpha$ implies $[a_{\beta_1} \setminus f_{\alpha}(\beta_1)] \cap [a_{\beta_2} \setminus f_{\alpha}(\beta_2)] = \emptyset$.

\textbf{Definition 3.3.} Suppose $\lambda$ is singular. A scale on $\lambda$ is an increasing sequence of regular cardinal $(\rho_\xi : \xi \in \text{cof}(\lambda))$ cofinal in $\lambda$, and a sequence $(f_\alpha : \alpha \in \lambda^+)$ such that for each $\alpha$, $f_\alpha \in \Pi_{\xi \in \text{cof}(\lambda)} \rho_\xi$, $\alpha < \alpha'$ implies $f_{\alpha} <^* f_{\alpha'}$, and $\forall f \in \Pi_{\xi \in \text{cof}(\lambda)} \rho_\xi \exists \alpha \in \lambda^+$ such that $f <^* f_{\alpha}$. We will assume $(\rho_\xi : \alpha \in \text{cof}(\lambda))$ is discontinuous everywhere and $\forall \alpha \in \lambda^+$ $\forall \xi \in \text{cof}(\lambda)$ $f_\alpha(\xi) > \sup \{ \rho_{\xi'} : \xi' < \xi \}$. An ordinal $\gamma$ is good for $(f_\alpha : \alpha \in \lambda^+)$ if $\exists A \subseteq \gamma$ unbounded and $\sigma < \text{cof}(\lambda)$ such that $\forall \alpha < \alpha'$ from $A$ and $\nu \in (\sigma, \text{cof}(\lambda))$ $f_{\alpha}(\nu) < f_{\alpha'}(\nu)$. The scale is good if $\exists$ club $C \subseteq \lambda^+$ such that $\forall \alpha \in C$ if $\text{cof}(\alpha) > \text{cof}(\lambda)$, then $\alpha$ is good for the scale. $GS(\lambda)$ means there is a good scale on $\lambda$. 

Remarks. 1. $\lambda$ regular implies $\text{AD}(\lambda)$.
2. $\text{AD}(\lambda)$ implies $\text{Sh}(\lambda)$. [She82]
3. $\text{GS}(\lambda)$ and $\lambda$ singular implies $\text{Sh}(\lambda)$. [Cum97]
4. $\square^*_\lambda$ implies $\text{AD}(\lambda)$. [CFM]
5. It is not known if $\exists\lambda - \text{Sh}(\lambda)$ is consistent (it is consistent to have $\exists\lambda[\neg \text{AD}(\lambda)$ and $\neg \text{GS}(\lambda)]$).
6. Shelah has proved that there is a scale for all singular $\lambda$ and that the set of good points is stationary for all scales ([HJS86]; also see [Cum97]). Shelah also gives an example of a model with no good scale ([HJS86]). Another example of a model with no good scale is given by Foreman and Magidor in [FM97], where they show a version of Chang's Conjecture, $(\aleph_{\omega+1},\aleph_\omega) \rightarrow (\aleph_1,\aleph_0)$, implies there is no good scale on $\aleph_\omega$.

The proof of the following theorem is essentially the same as Theorem 2.3.

**Theorem 3.4.** Assume $\text{Sh}(\lambda)$ and $\mathcal{F}$ is a pre-saturated filter on $\mathcal{P}(\lambda)$. Then $S_\lambda \in \mathcal{F}$.

**Theorem 3.5.** Suppose $\mathcal{F}$ is a cardinal preserving filter on $\mathcal{P}(\lambda)$ and $\text{AD}(\lambda)$. Then $S_\lambda \in \mathcal{F}$.

**Proof.** We will use Shelah's method of proof of Theorem 2.1 (page 440, [She82]). Let $\langle a_\alpha : \alpha \in \lambda^+ \rangle$, $\langle f_\alpha : \alpha \in \lambda^+ \rangle$ witness $\text{AD}(\lambda)$. Suppose $S_\lambda \notin \mathcal{F}$. Let $G \subseteq \mathcal{F}^+$ be generic with $\mathcal{P}(\lambda) \setminus S_\lambda \in G$. So we get $j : V \rightarrow (M,E) \subseteq V[G]$ with $\lambda^+ \subseteq M$ (we collapse the well-founded part of $M$), and $\mathcal{P}^V(\lambda) \subseteq M$, and $M \models \text{cof}(\lambda) \neq \text{cof}(\lambda)$. Work in $M$: we write $\lambda = \bigcup_{\alpha \in \text{cof}(\lambda)} A_\alpha$ where the $A_\alpha$'s are increasing, continuous and $|A_\alpha| < |\lambda|$. So if $a \subseteq \lambda$ is unbounded, then $\exists\alpha < \text{cof}(|\lambda|)$ such that $a \cap A_\alpha$ is unbounded in $\lambda$. Now work in $V[G]$: we have $\forall \alpha \in \lambda^+ \exists \beta \in \text{cof}(\lambda^+)|M$ such that $a_\alpha \cap A_\beta$ is unbounded in $\lambda$. So there is a fixed $\beta_0$ and an unbounded $A \subseteq \lambda^+$ such that $(\forall \alpha \in A) a_\alpha \cap A_{\beta_0}$ is unbounded in $\lambda$. Let $\alpha_0 \in A$ be such that $A \cap \alpha_0$ has order type $\lambda$. Note that $\langle a_\alpha : \alpha \in \alpha_0 \rangle, A_{\beta_0}$, and $f_{\alpha_0}$ are all in $M$. Now work in $M$: The set

$$\{ (a_\alpha \cap A_{\beta_0}) \setminus f_{\alpha_0}(\alpha) | \alpha < \alpha_0 \& a_\alpha \cap A_{\beta_0} \text{ is unbounded in } \lambda \}$$

is a family of $|\lambda|$ many non-empty pairwise disjoint subsets of $A_{\beta_0}$. But $|A_{\beta_0}| < |\lambda|$, contradiction. $\square$

As in section 2, these two theorems have the following three corollary’s:

**Corollary 3.6.** Assume $\text{AD}(\lambda)[\text{Sh}(\lambda)]$, $\kappa = \rho^+$, $\text{cof}(\lambda) < \kappa$, and $\text{cof}(\lambda) \neq \text{cof}(\rho)$. Then there is no cardinal preserving [pre-saturated] filter on $\mathcal{P}_{\kappa \lambda}$. 
THE EXTENT OF STRENGTH IN THE CLUB FILTERS

Corollary 3.7. Assume $AD(\lambda)$ [$\text{Sh}(\lambda)$], $\kappa = \rho^+ \geq \aleph_2$ and $\text{cof}(\lambda) \geq \kappa$. Then the club filter on $\mathcal{P}_\kappa \lambda$ is not cardinal preserving [pre-saturated].

Corollary 3.8. Assume $AD(\lambda)$ [$\text{Sh}(\lambda)$], $\kappa$ is a regular limit cardinal and $\text{cof}(\lambda) \neq \kappa$. Then the club filter on $\mathcal{P}_\kappa \lambda$ is not cardinal preserving [pre-saturated].

Theorem 3.9. Assume $\text{cof}(\lambda) < \kappa$ and there is a good scale on $\lambda$. Then there is no weakly pre-saturated filter on $\mathcal{P}_\kappa \lambda$.

Proof. Suppose not. So there is $j : V \to M \subseteq V[G]$ such that $\lambda^+_j$ is still a cardinal of $V[G]$, $M$ is well-founded, $\mathcal{P}^V(\lambda) \subseteq M$, and $\text{cp}(j) = \kappa$ with $j(\kappa) > \lambda$. Let $\langle \alpha : \alpha \in \lambda^+ \rangle$ be a good scale on $\lambda$. So there is a club $C \subseteq \lambda^+$ such that $\alpha \in C$ and $\text{cof}(\alpha) > \text{cof}(\lambda)$ implies $\alpha$ is good for $\langle \alpha : \alpha \in \lambda^+ \rangle$. Let $\rho = \sup j''\lambda^+$ Note that $\rho < j(\lambda^+)$ (see [BM97]) and so $\rho \in j(C)$. Since $V[G] \models \text{cof}(\rho) = \lambda^+$, $M \models \text{cof}(\rho) \geq \lambda^+ > \text{cof}(\lambda)$.

Then, normal work in $V[G]$ and repeat an argument from [Cum97]. For each $\alpha$ in $\lambda^+$ choose $\beta_\alpha < \delta_\alpha$ from $A$ and $\gamma_\alpha \in \lambda^+$ such that $\beta_\alpha < j(\gamma_\alpha) < \delta_\alpha$. Do this so $\alpha_1 < \alpha_2$ implies $\delta_{\alpha_1} < \beta_{\alpha_2}$ and $\sup \{ \beta_\alpha : \alpha \in \lambda^+ \} = \rho$. For each $\alpha \in \lambda^+$ $\exists \sigma_\alpha < \text{cof}(\lambda)$ such that $j(f)_{\beta_\alpha} < j(f)_{j(\gamma_\alpha)} < j(f)_{\delta_\alpha}$ beyond $\sigma_\alpha$. Since $\lambda^+$ is regular there is an unbounded $B \subseteq \lambda^+$ and fixed $\sigma_1$ such that $\forall \sigma \in B \sigma_\sigma = \sigma_1$. Let $\tilde{\sigma} = \max(\sigma, \sigma_1)$. But then if $\alpha_1 < \alpha_2$ are from $B$, then $f_{\gamma_{\alpha_1}}(\tilde{\sigma} + 1) < f_{\gamma_{\alpha_2}}(\tilde{\sigma} + 1)$. Hence $\lambda^+$ must be collapsed in $V[G]$. \qed

Precipitousness is ruled out under certain conditions by the following theorem of Matsubara and Shioya.

Theorem 3.10. [MS] If $\lambda^{<\kappa} = 2^\lambda$ and $2^{<\kappa} < 2^\lambda$, then the club filter on $\mathcal{P}_\kappa \lambda$ is nowhere precipitous.
