1. INTRODUCTION

Let $\mathcal{E}^*$ be the space of tempered distributions and $\mu$ be the standard Gaussian measure on $\mathcal{E}^*$. Being motivated by the distribution theory on infinite dimensional space by Cochran, Kuo and Sengupta (CKS) [6], Asai, Kubo and Kuo (AKK) have recently determined the best possible class $C^{(2)}_{+1,\frac{1}{2},1}$ of functions $u$ to construct white noise triple,

$$[\mathcal{E}]_u \subset L^2(\mathcal{E}^*, \mu) \subset [\mathcal{E}]_*^*,$$

and to characterize white noise test function space $[\mathcal{E}]_u$ and generalized function space $[\mathcal{E}]_*^*$ in the series of papers [1],[2],[3],[4],[5]. The notion of Legendre transformation plays important roles to examine relationships between the growth order of holomorphic functions (S-transform) and the CKS-space of white noise test and generalized functions. It is well-known that a positive generalized function is induced by a Hida measure $\nu$ (generalized measure). A Hida measure can be characterized by integrability conditions on a function inducing the above triple ([5]). See also [20],[21],[25] for an overview of other recent developments in white noise analysis.

This short note is organized as follows. In Section 2, we give a short summary of white noise analysis including AKK's results. A certain class of convex functions will be introduced to make use of Legendre transformation and dual functions for our purposes. In Section 3, we restate the characterization theorems of the spaces of white noise test and generalized functions given in [3],[5]. In Section 4, we give a quick review of the basic facts on the theory of positive generalized functions [12],[19],[29]. Finally, we discuss the characterization of a Hida measure (Theorem 4.5). In this connection, we present the grey noise and the Poisson noise measures as typical examples inducing positive generalized functions (Examples 4.7 and 4.8, respectively). Moreover, we mention breifly the relationship between $[\mathcal{E}]_u$ and $L^*$-space on $(\mathcal{E}^*, \nu)$ (Proposition 4.6).
2. Preliminaries

Let us start with taking a special choice of a Gel'fand triple:

\[ \mathcal{E} = S(\mathbb{R}) \subset \mathcal{E}_0 = L^2(\mathbb{R}, dt) \subset \mathcal{E}^* = S^*(\mathbb{R}) \]

just for convenience where \( S \) is the Schwartz space of rapidly decreasing functions and \( S^* \) is the space of tempered distributions. Consult excellent books [19],[24] for more general construction. Let \( A = 1 + t^2 - d^2/dt^2 \). It is well-known that \( A \) is a densely defined positive self-adjoint operator on \( \mathcal{E}_0 \). So there exists an orthonormal basis \( \{e_j\}_{j=0}^\infty \subset \mathcal{E} \) for \( \mathcal{E}_0 \) satisfying \( Ae_j = (2j+2)e_j \). For each \( p \geq 0 \) we define \( |f|_p = |A^p f|_0 \) and let \( \mathcal{E}_p = \{f \in \mathcal{E}_0 ; |f|_p < \infty, p \geq 0\} \). Note that \( \mathcal{E}_p \) is the completion of \( \mathcal{E} \) with respect to the norm \(| \cdot |_p\). Moreover,

\[ \rho = \|A^{-1}\|_{op} = \frac{1}{2}, \quad \|i_{q,p}\|_{HS}^2 = \sum_{j=0}^{\infty} (2j+2)^{-(q-p)} < \infty \]

for any \( q > p \geq 0 \). Then the projective limit space \( \mathcal{E} \) of \( \mathcal{E}_p \) is a nuclear space and the dual space of \( \mathcal{E} \) is nothing but \( \mathcal{E}^* \). Hence we have the following continuous inclusions:

\[ \mathcal{E} \subset \mathcal{E}_p \subset \mathcal{E}_0 \subset \mathcal{E}_p^* \subset \mathcal{E}^*, \quad p \geq 0. \]

where the norm on \( \mathcal{E}_p^* \) is given by

\[ |f|_{-p} = |A^{-p} f|_0. \]

Troughout this paper, we denote the complexification of a real space \( X \) by \( X_c \). Let \( \mu \) be the standard Gaussian measure on \( \mathcal{E}^* \) given by

\[ e^{-\frac{1}{2} |\xi|^2} = \int_{\mathcal{E}^*} e^{i(x, \xi)} \mu(dx), \quad \xi \in \mathcal{E}^*. \]

The probability space \( (\mathcal{E}^*, \mu) \) is called the white noise space or Gaussian space. Let \( (L^2) = L^2(\mathcal{E}^*, \mu) \) denote the Hilbert space of \( \mu \)-square integrable functions on \( \mathcal{E}^* \). By the Wiener-Itô theorem each \( \varphi \) in \( (L^2) \) can be uniquely expressed as

\[ \varphi = \sum_{n=0}^{\infty} I_n(f_n) = \sum_{n=0}^{\infty} \langle : \otimes n, f_n \rangle, \quad f_n \in \mathcal{E}_0^\otimes n, \quad (2.1) \]

and the \( (L^2) \)-norm \( \|\varphi\|_0 \) of \( \varphi \) is given by

\[ \|\varphi\|_0 = \left( \sum_{n=0}^{\infty} n! |f_n|_0^2 \right)^{1/2}. \]

We now briefly recall notions and results discussed by Asai et al. [2],[3].

**Definition 2.1.** Let \( u \) be a positive continuous function on \( [0, \infty) \). The function \( u \) is called \((log, x^2)\)-convex if \( \log u(x^2) \) is convex on \( [0, \infty) \).
Definition 2.2.

(1) Let \(C_{+\log}\) be the class of all positive continuous functions on \([0, \infty)\) and
\[
\lim_{r \to \infty} \frac{\log u(r)}{\log r} = \infty.
\] (2.2)

(2) Let \(C_{+\frac{1}{2}}\) be the class of all positive continuous functions on \([0, \infty)\) and
\[
\lim_{r \to \infty} \frac{\log u(r)}{\sqrt{r}} = \infty.
\] (2.3)

(3) Let \(C_{+\frac{1}{2},1}\) be the class of functions \(u \in C_{+\frac{1}{2}}\) such that
\[
\lim_{r \to \infty} \frac{\log u(r)}{r} < \infty.
\] (2.4)

(4) Let \(C_{+\frac{1}{2}}^{(2)}\) (or \(C_{+\frac{1}{2},1}^{(2)}\)) be the class of all \((\log, x^2)\)-convex functions in \(C_{+\frac{1}{2}}\) (or \(C_{+\frac{1}{2},1}\)), respectively.

Definition 2.3. The Legendre transform \(\ell_u\) of a function \(u \in C_{+\log}\) is defined by
\[
\ell_u(t) := \inf_{r > 0} \frac{u(r)}{r^t}, \quad t \geq 0
\] (2.5)

Definition 2.4. The dual Legendre function \(u^*\) of a function \(u \in C_{+\frac{1}{2}}\) is given by
\[
u^*(r) := \sup_{s > 0} \frac{e^{2\sqrt{rs}}}{u(s)} \in C_{+\frac{1}{2}}^{(2)}.
\] (2.6)

Definition 2.5. Two positive sequences \(\{a(n)\}_{n=0}^\infty\) and \(\{b(n)\}_{n=0}^\infty\) are called equivalent (denoted by \(a(n) \sim b(n)\)) if there exist positive constants \(K_1, K_2, c_1, c_2\) such that
\[
K_1 c_1^n a(n) \leq b(n) \leq K_2 c_2^n a(n) \quad \text{for any } n \in \mathbb{N}.
\] (2.7)

Definition 2.6. A positive sequence \(\{a(n)\}_{n=0}^\infty\) is a dual sequence of \(\{b(n)\}_{n=0}^\infty\) if \(a(n)b(n) \sim (n!)^{-2}\) holds.

According to Theorem 4.6 in [3], for a function \(u \in C_{+\frac{1}{2}}^{(2)}\) we have
\[
\ell_u^*(n) \sim \frac{1}{\ell_u(n)(n!)^2}.
\] (2.8)

Thus, \(\{\ell_u^*(n)\}_{n=0}^\infty\) is a dual sequence of \(\{\ell_u(n)\}_{n=0}^\infty\).
Definition 2.7. Two positive functions \( u(r) \) and \( v(r) \) on \([0, \infty)\) are called equivalent (denoted by \( u(r) \approx v(r) \)) if there exist positive constants \( a_1, a_2, c_1, c_2 \) such that
\[
c_1 u(a_1 r) \leq v(r) \leq c_2 u(a_2 r) \quad \text{for any } r \geq 0.
\] (2.9)

The condition (2.3) is required for both \( u \) and \( u^* \) to be equivalent to entire functions, respectively. This requirement is essential for Theorem 3.1 and Theorem 3.2 which will be discussed later.

Next, we describe the spaces of test and generalized functions on the space \( \mathcal{E}^* \) introduced by Cochran et al. in a recent paper [6]. Let \( \{\alpha(n)\}_{n=0}^{\infty} \) be a weight sequence satisfying the following two conditions [2],[4],[6]:

(A1) \( \alpha(0) = 1 \) and \( \inf_{n \geq 0} \alpha(n) \sigma^n > 0 \) for some \( \sigma \geq 1 \).

(A2) \( \lim_{n \to \infty} \left( \frac{\alpha(n)}{n!} \right)^{1/n} = 0 \).

Let \( \varphi \in (L^2) \) be represented as in Equation (2.1). For \( p \geq 0 \) and a given function \( u \in C_{+, \frac{1}{2}, 1}^{(2)} \), define
\[
\|\varphi\|_{u,p} = \left( \sum_{n=0}^{\infty} \frac{1}{\ell_u(n)} |f_n|_p^2 \right)^{1/2}, \quad f_n \in \mathcal{E}_{p,c}^n.
\] (2.10)
where \( |f_n|_p = |(A^n)^p f_n|^2 \). Note that since \( \ell_u(n) \) and \( \ell_{u*}(n) \) are dual sequences of one another, we choose \( \alpha(n) = (n! \ell_u(n))^{-1} \approx n! \ell_{u*}(n) \) as a weight sequence. It is easy to check by (2.3), (2.4) and (2.5) that the above weight sequence with assumptions, \( u \in C_{+, \frac{1}{2}, 1}^{(2)} \) and \( \inf\{u(r); r \geq 0\} = 1 \), satisfies the conditions (A1) and (A2). Let \( \mathcal{E}_p^* = \{ \varphi \in (L^2); \|\varphi\|_{u,p} < \infty \} \). Define the space \( [\mathcal{E}]_u \) of test functions to be the projective limit of the family \( \{[\mathcal{E}]_p; p \geq 0\} \). Its dual space \( [\mathcal{E}]_u^* \) is the space of generalized functions. By identifying \( (L^2) \) with its dual we get the following continuous inclusion maps:
\[
[\mathcal{E}]_u \subset [\mathcal{E}]_p \subset \subset (L^2) \subset [\mathcal{E}]_p^* \subset [\mathcal{E}]_u^*, \quad p \geq 0.
\]

Note that the condition (2.4) is needed in order to have the continuous inclusion \( [\mathcal{E}]_p \subset (L^2) \) for \( p \geq 0 \). The canonical bilinear form on \( [\mathcal{E}]_u^* \times [\mathcal{E}]_u \) is denoted by \( \langle \cdot, \cdot \rangle \). For each \( \Phi \in [\mathcal{E}]_p^* \) there exists a unique \( F_n \in (\mathcal{E}_{p,c}^n)^{symm} \) such that
\[
\langle \Phi, \varphi \rangle = \sum_{n=0}^{\infty} n! \langle F_n, f_n \rangle
\]
and
\[
\|\varphi\|_{u^*, -p} = \left( \sum_{n=0}^{\infty} \frac{1}{\ell_{u*}(n)} |F_n|_{-p}^2 \right)^{1/2}.
\] (2.11)

The Gel'fand triple \( [\mathcal{E}]_u \subset (L^2) \subset [\mathcal{E}]_u^* \) is called the Cochran-Kuo-Sengupta space (CKS-space for short) associated with a given weight function \( u \in C_{+, \frac{1}{2}, 1}^{(2)} \) (see [4],[5]). We remark that some similar results have been obtained independently by Gannoun et al. [7].
Example 2.8. Let $0 \leq \beta < 1$. If $v(r) = \exp((1 + \beta)r^{1/\beta})$, then $v \in C_{+,\frac{1}{2},1}^{(2)}$. In addition, the dual function is $v^*(r) = \exp((1 - \beta)r^{1/\beta})$. By Stirling formula, we have for any $n \geq 0$

\[
\frac{1}{(n!)^{1+\beta}} \leq \ell_v(n) = \left(\frac{e}{n}\right)^{(1+\beta)n} \leq \left(\frac{e2^{n/2}}{n!}\right)^{1+\beta}
\]  \hspace{1cm} (2.12)

That is, $\ell_v(n) \sim (n!)^{-(1+\beta)}$. On the other hand, similarly we get $\ell_{v^*}(n) \sim (n!)^{-(1-\beta)}$. Hence $\ell_{u_k}(n)$ and $\ell_{u^*_k}(n)$ are dual sequences of one another. This example induces the Hida-Kubo-Takenaka space with $\beta = 0$ [9],[17],[18],[24],

$$(\mathcal{E})_0 \subset (L^2) \subset (\mathcal{E})_0^*,$$

and the Kondratiev-Streit space [13],[14],[19],

$$(\mathcal{E})_\beta \subset (L^2) \subset (\mathcal{E})_\beta^*, \hspace{0.5cm} 0 \leq \beta < 1.$$

Example 2.9. Let

\[ u_k(r) = \frac{\exp_k(r)}{\exp_k(0)} = \sum_{n=0}^{\infty} \frac{b_k(n)}{n!} r^n. \]

where

\[ \exp_1(r) := \exp(r), \hspace{0.5cm} \exp_k(r) := \exp(\exp_{k-1}(r)) \hspace{0.5cm} \text{for} \hspace{0.5cm} k \geq 2 \]

and $b_k(n)$ is the $k$-th order Bell number [1],[2],[3],[4],[6],[15]. Then its dual Legendre function $u_k^*$ is equivalent to the function

\[ u_k^*(r) \approx \exp \left[ 2\sqrt{r \log_{k-1} \sqrt{r}} \right], \]

where $\log_k(r)$ is given by

\[ \log_1(r) := \log(\max\{e, r\}), \hspace{0.5cm} \log_k(r) := \log_1(\log_{k-1}(r)) \hspace{0.5cm} \text{for} \hspace{0.5cm} k \geq 2. \]

Then, $u_k^* \in C_{+,\frac{1}{2},1}^{(2)}$. Details of $\ell_{u_k}(n)$ can be found in [15],[16]. The Gel'fand triple

\[ [\mathcal{E}]_{u_k} \subset (L^2) \subset [\mathcal{E}]_{u_k}^* \]

is called the Bell number space of order $k$ [6] and

\[ [\mathcal{E}]_{u_k} \subset (\mathcal{E})_\beta \subset (L^2) \subset (\mathcal{E})_\beta^* \subset [\mathcal{E}]_{u_k}^*. \]
Remark. We point out here that

$$(\mathcal{E})_{1} \subset [\mathcal{E}]_{u} \subset (L^{2}) \subset (\mathcal{E})_{u}^{*} \subset (\mathcal{E})_{0}^{*} \subset \mathcal{E}^{*}$$

holds for any $u \in C_{+, \frac{1}{2}, 1}$.

3. GENERAL CHARACTERIZATION THEOREMS

The exponential function (or coherent state) $\phi_{\xi}(\cdot)$ is given by

$$\phi_{\xi} = e^{\langle \cdot, \xi \rangle |\epsilon|_{0}^{2}} = \sum_{n=0}^{\infty} \frac{1}{n!} \langle \cdot, \xi^{\otimes n} \rangle,$$

$\xi \in \mathcal{E}_{c}$.

Since it is well-known that the exponential functions $\{\phi_{\xi} ; \xi \in \mathcal{E}_{c}\}$ span a dense subspace of $[\mathcal{E}]_{u}$, $\Phi \in [\mathcal{E}]_{u}^{*}$ is uniquely determined by its $S$-transform:

$$S \Phi(\xi) := \langle \Phi, \phi_{\xi} \rangle, \quad \xi \in \mathcal{E}_{c}.$$

Now we are in a position to state the characterization theorems of test and generalized functions under very general assumptions. We remark that these theorems were examined in [22],[27] for the Hida-Kubo-Takenaka space case and [13],[14] for the Kondratiev-Streit space case.

**Theorem 3.1** ([3],[5]). Let $u \in C_{+, \frac{1}{2}, 1}^{(2)}$ be increasing with $u(0) = 1$. A function $F : \mathcal{E}_{c} \to \mathbb{C}$ is the $S$-transform of some $\Phi \in [\mathcal{E}]_{u}^{*}$ if and only if

(F1) $z \mapsto F(z\xi + \eta)$ is entire holomorphic in $z \in \mathbb{C}$ for any $\xi, \eta \in \mathcal{E}_{c}$,

(F2) For any $a, p \geq 0$, there exists a constant $K > 0$ such that

$$|F(\xi)| \leq Ku^{*}(a|\xi|_{p}^{2})^{\frac{1}{2}} \quad \text{for any } \xi \in \mathcal{E}_{c}. \quad (3.1)$$

In addition, in that case,

$$\|\Phi\|_{u, q}^{2} \leq K^{2}(1 - ae^{2}\|i_{p, q}\|_{HS}^{2})^{-1} \quad (3.2)$$

for any $q < p$ satisfying $ae^{2}\|i_{p, q}\|_{HS}^{2} < 1$.

**Theorem 3.2** ([5]). Suppose that $u \in C_{+, \frac{1}{2}, 1}^{(2)}$ and $\inf_{r>0} u(r) = 1$. A function $F : \mathcal{E}_{c} \to \mathbb{C}$ is the $S$-transform of some $\Phi \in [\mathcal{E}]_{u}^{*}$ if and only if

(F1) $z \mapsto F(z\xi + \eta)$ is entire holomorphic in $z \in \mathbb{C}$ for any $\xi, \eta \in \mathcal{E}_{c}$,

(F2) there exist nonnegative constants $K, a$ and $p$ such that

$$|F(\xi)| \leq Ku^{*}(a|\xi|_{p}^{2})^{\frac{1}{2}} \quad \text{for any } \xi \in \mathcal{E}_{c}. \quad (3.3)$$

In addition, in that case,

$$\|\Phi\|_{u^{*}, q}^{2} \leq K^{2}(1 - ae^{2}\|i_{q, q}\|_{HS}^{2})^{-1} \quad (3.4)$$

for any $q > 0$ satisfying $ae^{2}\|i_{q, q}\|_{HS}^{2} < 1$. 
Remark. In [8], Hida introduced the infinite dimensional analogue of Fourier transform, so-called $T$-transform, given by

$$T\Phi(\xi) = \langle\langle\Phi, e^{i\langle\cdot,\xi\rangle}\rangle, \quad \xi \in \mathcal{E}_e.$$  

(3.5)

It is well-known that the $T\Phi(z\xi+\eta)$ is entire holomorphic in $z \in \mathbb{C}$ for any $\xi, \eta \in \mathcal{E}_e$. In addition, there is a nice relationship between $T$-transform and $S$-transform:

$$S\Phi(\xi) = T(-i\xi) \exp\left[-\frac{1}{2}\langle\xi,\xi\rangle\right], \quad \xi \in \mathcal{E}_e.$$  

(3.6)

and

$$T\Phi(\xi) = S(i\xi) \exp\left[-\frac{1}{2}\langle\xi,\xi\rangle\right], \quad \xi \in \mathcal{E}_e.$$  

(3.7)

Therefore, Theorems 3.1 and 3.2 remain valid even if the $S$-transform is replaced by the $T$-transform.

4. Characterization of Positive Generalized Functions

**Definition 4.1.** A measure $\nu$ on $\mathcal{E}^*$ is called a Hida measure if $[\mathcal{E}]_u \subset L^1(\nu)$ and the mapping $\varphi \mapsto \int_{\mathcal{E}} \varphi(x)\nu(dx)$ is continuous on $[\mathcal{E}]_u$.

Suppose $\Phi \in [\mathcal{E}]_*^*$ is induced by a Hida measure $\nu$ on $\mathcal{E}^*$. Then

$$\langle\langle \Phi, \varphi \rangle \rangle = \int_{\mathcal{E}} \varphi(x)\nu(dx), \quad \varphi \in [\mathcal{E}]_u.$$  

In particular, take $\varphi = e^{i\langle\cdot,\xi\rangle}$, $\xi \in \mathcal{E}$. Then, we have the $T$-transform restricted to $\mathcal{E}$ by

$$T\Phi(\xi)|_{\mathcal{E}} := \langle\langle \Phi, e^{i\langle\cdot,\xi\rangle} \rangle \rangle = \int_{\mathcal{E}} e^{i\langle\cdot,\xi\rangle}\nu(dx), \quad \xi \in \mathcal{E}.$$  

It is clearly seen that $T\Phi(\xi)|_{\mathcal{E}}$ is equal to the characteristic function $C(\xi)$ of $\nu$. Thus in order to see the existence of a measure $\nu$, we only need to check that the function $T\Phi(\xi)|_{\mathcal{E}}$ satisfies the following conditions:

1. $T\Phi(\xi)|_{\mathcal{E}}$ is continuous on $\mathcal{E}$.
2. $T\Phi(\xi)|_{\mathcal{E}}$ is positive definite on $\mathcal{E}$.

**Definition 4.2.** A generalized function $\Phi \in [\mathcal{E}]_*^*$ is called positive if $\langle\langle \Phi, \varphi \rangle \rangle \geq 0$ for all nonnegative test functions $\varphi \in [\mathcal{E}]_u$.

Hence for any nonnegative test function $\varphi \in [\mathcal{E}]_u$,

$$\langle\langle \Phi, \varphi \rangle \rangle = \int_{\mathcal{E}} \varphi(x)\nu(dx) \geq 0.$$
Thus $\Phi$ is a positive generalized function. In the following, Theorem 4.3 says that all of positive generalized functions is generalized functions induced by Hida measures on $\mathcal{E}^*$.

**Theorem 4.3.** Let $u \in C^{(2)}_{+,\frac{1}{2},1}$ and $\Phi \in [\mathcal{E}]_u^*$. Then the following statements are equivalent:

(a) $\Phi$ is positive.
(b) $T\Phi$ is positive definite on $\mathcal{E}$.
(c) $\Phi$ is induced by a Hida measure. That is, there exists a finite measure $\nu$ on $\mathcal{E}^*$ such that $[\mathcal{E}]_u \subset L^1(\nu)$ and

$$\langle \Phi, \varphi \rangle = \int_{\mathcal{E}^*} \varphi(x) \nu(dx), \quad \varphi \in [\mathcal{E}]_u.$$

**Remark.** For the Kondratiev-Streit space, the equivalence of (a) ~ (c) has been discussed in [19]. The equivalence of (a) and (c) was examined originally in [12] and [29] only for the case of the Hida-Kubo-Takenaka space.

Next, our problem is how to characterize Hida measures on $\mathcal{E}^*$. For this purpose, based on Lee's idea [23] (see also [3],[5],[19],[26]), we shall define another norm as follows. Let $A_{u,p}$ be the space of all functions $\varphi$ on $\mathcal{E}_{p,c}^*$ satisfying the following conditions:

(A1) $\varphi$ is an analytic function on $\mathcal{E}_{p,c}^*$.
(A2) There exists a nonnegative constant $C$ such that

$$|\varphi(x)|^2 \leq Cu(|x|^2-p)$$

for any $x \in \mathcal{E}_{p,c}^*$.

For $\varphi \in A_{u,p}$, its norm is defined by

$$\|\varphi\|_{A_{u,p}} := \sup_{x \in \mathcal{E}_{p,c}^*} |\varphi(x)| u(|x|^2-p)^{-\frac{1}{2}}. \quad (4.1)$$

for a function $u \in C_{+,\log}$. Define the space $A_u$ of test functions on $\mathcal{E}^*$ by

$$A_u = \lim_{p \to \infty} A_{u,p}.$$

**Proposition 4.4.** Suppose that $u \in C^{(2)}_{+,\frac{1}{2},1}$. Then $\{\| \cdot \|_{A_{u,p}}; p \geq 1\}$ is equivalent to $\{\| \cdot \|_{u,p}; p \geq 1\}$. As a result, $A_u = [\mathcal{E}]_u$ as vector spaces.

**Remark.** This proposition implies that

$$A_u^* = [\mathcal{E}]_u^*$$

and they have the same inductive limit topology. Moreover, for the construction of spaces $A_u$ and $A_u^*$ the Wiener-Itô decomposition theorem is not used and a measure on $\mathcal{E}^*$ is not refered to at all.

We are in a position to state our characterization theorem of Hida measure in terms of positivity and integrability condition. The proof of Theorem 4.5 is based on simple applications of $S$-transform ($T$-transform, equivalently the Bochner-Minlos
Theorem), the dual functions given in (2.6) and some technical estimations. See [5] for details.

**Theorem 4.5** ([5]). Suppose that \( u \in C_{+,\frac{1}{2},1}^{(2)} \). A measure \( \nu \) on \( \mathcal{E}^* \) is a Hida measure inducing a positive generalized function \( \Phi_{\nu} \in [\mathcal{E}]_u^* \) if and only if \( \nu \) is supported in \( \mathcal{E}_p^* \) for some \( p \geq 1 \) and

\[
\int_{\mathcal{E}_p^*} u(|x|^2_p)^{\frac{1}{2}} \nu(dx) < \infty.
\]

**Remark.** See [23] for the Hida-Kubo-Takenaka space and [19] for the Kondratiev-Streit space.

**Proposition 4.6.** Let \( u \in C_{+,\frac{1}{2},1}^{(2)} \) and \( \nu \) be a Hida measure on \( \mathcal{E}^* \) inducing a generalized function \( \Phi_{\nu} \) in \( [\mathcal{E}]_u^* \). Then \( [\mathcal{E}]_u \subset \cap_{1 \leq s < \infty} L^s(\mathcal{E}^*, \nu) \). In addition, for each \( 1 \leq s < \infty \), the inclusion mapping \( [\mathcal{E}]_u \rightarrow L^s(\nu) \) is continuous.

**Example 4.7.** (Grey noise measure)
Let \( 0 < \lambda \leq 1 \). The grey noise measure on \( \mathcal{E}^* \) is the measure \( \nu_\lambda \) having the characteristic function

\[
L_\lambda(|\xi|_0^2) = \int_{\mathcal{E}^*} e^{ix\cdot\xi} \nu_\lambda(dx), \quad \xi \in \mathcal{E},
\]

where \( L_\lambda(t) \) is the Mittag-Leffler function with parameter \( \lambda \);

\[
L_\lambda(t) = \sum_{n=0}^{\infty} \frac{(-t)^n}{\Gamma(1 + \lambda n)}.
\]

Here \( \Gamma \) is the Gamma function. This measure was introduced by Schneider [28]. It is shown in [19] that \( \nu_\lambda \) is a Hida measure which induces a generalized function \( \Phi_{\nu_\lambda} \) in \( (\mathcal{E})_{1-\lambda}^* \). Therefore by Theorem 4.5 and Example 2.8 the grey noise measure \( \nu_\lambda \) satisfies

\[
\int_{\mathcal{E}_p^*} \exp\left(\frac{1}{2}(2 - \lambda)|x|_p^2\right) \nu_\lambda(dx) < \infty
\]

for some \( p \).

**Example 4.8.** (Poisson measure)
Let \( \mathcal{P} \) be the Poisson measure on \( \mathcal{E}^* \) given by

\[
\exp\left(\int_{\mathbb{R}} \left( e^{i\xi(t)} - 1 \right) dt \right) = \int_{\mathcal{E}^*} e^{ix\cdot\xi} \mathcal{P}(dx), \quad \xi \in \mathcal{E}^*.
\]
It has been shown [6] that the Poisson noise measure induces a generalized function in the Bell number space of order 2. Thus by Theorem 4.5 and Example 2.9 we have the integrability condition

$$\int_{\mathcal{E}_p} \exp \left( |x|_p \sqrt{\log |x|_p} \right) \mathcal{P}(dx) < \infty$$

for some $p$.
