Syntheses of Dimethyldibenzyls

Sango Kunichika, Shinzaburo Oka and Takashi Sugiyama*
(Kunichika Laboratory)

Received June 10, 1965

The symmetrical 2,2'-, 3,3'-, and 4,4'-dimethyldibenzyl were obtained respectively by the Wurtz reaction of the corresponding methylbenzyl chlorides prepared from o-, m- toluidine and p-cymene through several steps. The unsymmetrical 2,3'-, 2,4'-, and 3,4'-dimethyldibenzyl were obtained respectively by the Wolf-Kishner reduction of the corresponding semicarbazones derived from ketones which were prepared from the appropriate tolunitrile and tolyl magnesium bromide. The gas chromatographic separation of a mixture of the six isomers was successfully made with a 90m. butanediol succinate polyester-coated capillary column at 170°.

INTRODUCTION

The Friedel-Crafts reaction of 1,2-dichloroethane with toluene studied by several investigators1-6 gave a mixture of six isomers of dimethyldibenzyls which would be raw materials for the production of aromatic dibasic acids. No details, however, were available for the relationship between the reaction conditions and the isomers distribution, because the separation or analytical determination of these isomers was very difficult.

For the purpose of clarifying the above relationship by establishing the effective analytical method, the present authors have for the first time carried out the syntheses of the six pure isomers which are required for the standard samples on the gas chromatographic analysis of their mixtures.

RESULTS

Several well-known reactions which include neither isomerization of the products, nor formation of unseparable by-products, were used for the syntheses of the pure isomers.

Syntheses of the symmetrical isomers. For example, the synthetic route to 2,2'-isomer is shown as follows.

\[
\begin{align*}
\text{CH}_3\text{-}\text{CH}_3\text{-}\text{CH}_3 & \xrightarrow{\text{Diazotization}} \text{CH}_3\text{-}\text{CN} \xrightarrow{\text{Hydrolysis}} \text{CH}_3\text{-}\text{CO}_2\text{H} \\
\text{H}^+ & \xrightarrow{\text{C}_6\text{H}_5\text{OH}} \text{CH}_3\text{-}\text{CO}_2\text{C}_6\text{H}_5 \xrightarrow{\text{LiAlH}_4} \text{CH}_3\text{-}\text{CH}_2\text{OH} \xrightarrow{\text{SOCl}_2} \text{CH}_3\text{-}\text{CH}_2\text{Cl}
\end{align*}
\]

* 国枝三吾，関信三郎，杉山卓
Syntheses of Dimethyldibenzyls

In the case of 4,4'-isomer, the starting material was \( p \)-cymene and it yielded \( p \)-toluic acid by oxidation with nitric acid. The three symmetrical dimethyldibenzyls were obtained in a pure state by the Wurtz reaction of the corresponding methylbenzyl chlorides with metallic sodium, as has been reported by Farthing\(^6\).

**Syntheses of the unsymmetrical isomers.** For example, the synthetic route to 2,3'-isomer is shown as follows.

\[
\begin{align*}
\text{CH}_3\text{NH}_2 & \xrightarrow{\text{Diazo}} \text{CH}_3\text{Br} \\
& \xrightarrow{\text{Cu, HBr}} \text{CH}_3\text{MgBr} \\
\text{CH}_3\text{NH}_2 & \xrightarrow{\text{Diazo}} \text{CN} \\
& \xrightarrow{\text{CuCN}} \text{CH}_3\text{CN} \\
& \xrightarrow{\text{Hydrol}} \text{CH}_3\text{OH} \\
& \xrightarrow{\text{HBr}} \text{CH}_3\text{MgBr} \\
& \xrightarrow{\text{CN}} \text{CH}_3\text{CN} \\
& \xrightarrow{\text{HCl}} \text{CH}_3\text{OH} \\
& \xrightarrow{\text{NH}_2\text{CONH}_2 \text{N}} \text{CH}_3\text{CN} \\
& \xrightarrow{\text{Heated at 200\textdegree \ in triethylene glycol}} \text{CH}_3\text{CH}_2\text{CH}_3
\end{align*}
\]

Though the intermediate ketimine salts were resistant to usual hydrolysis\(^6\) with aqueous ammonium chloride, further addition of dil. hydrochloric acid effected completely the hydrolysis. The resulting ketones were contaminated with a small amount of the symmetrical dimethyldibenzyls which were formed from two molecules of the methylbenzyl chlorides by the action of magnesium. These impurities were easily removed off by recrystallization of the semicarbazones derived from the ketones. According to the Huang–Minlon procedure\(^5\), the semicarbazones were decomposed by alkali in triethyleneglycol to give the three unsymmetrical dimeth-

![Absorption spectrum of 2,3'-dimethyldibenzyl]**.

\( \text{Fig. 1. Absorption spectrum of 2,3'-dimethyldibenzyl}^{**} \)
ydibenzyls in a pure state. Isolation of their pure specimens are not yet found in the literature, though the Friedel-Crafts reaction of 1,2-dichloroethane with toluene gave a mixture containing them\(^{1-9}\).

The purity of the six isomers thus obtained was determined by gas chroma-

![Absorption spectrum of 3,4'-dimethyldibenzyl.](image2)

**Conventional methods of mulling the sample in Nujol were used.**

tographic analysis to be better than 98%.

Infrared spectra of the symmetrical isomers (Figs. 1-3) showed characteristic strong bands (CH out-of-plane deformation vibrations) of o-, m-, and p-disubstituted aromatics at 752 cm⁻¹, 778 and 695 cm⁻¹, and 810 cm⁻¹, respectively. As was expected, those of the unsymmetrical isomers (Figs. 4-6) showed strong bands due to two kinds of the corresponding disubstituted aromatics at 773, 742 and 698 cm⁻¹, 808 and 743 cm⁻¹, and 805, 785 and 695 cm⁻¹, respectively.

Gas chromatographic separation of a mixture of the six isomers. Attempts with several kinds of packed columns to separate the isomers under various conditions, were all unsuccessful. Apparently the too high boiling point (about 300°) of the samples limited the selection of the columns.

Recently a highly efficient gas chromatograph with the Golay-type capillary column has been used for a mixture of isomers of disubstituted aromatics and others, of which separations are very difficult with packed columns.

The examinations on several kinds of capillary columns have resulted in finding that 90m. butanediol succinate polyester-coated capillary column effects the satisfactory separation of a mixture of six dimethyldibenzyls as shown in Fig. 7.
EXPERIMENTAL

Materials. *o-*-, *m-*Toluidine, and *p-*cymene were commercial materials of highest available purity. The purity of toluidines was checked by gas chromatographic analysis with 45m. polypropylene glycol-coated capillary column at 125° to be better than 99%.

* Description of the temperature is not found in the literature.

**p-Methylbenzyl alcohol.** As has been shown by Newman, the Grignard reagent, prepared from 80g. of p-bromotoluene and 13.3 g. of magnesium turning in 200ml. of ether, was allowed to react with 20 g. of dry paraformaldehyde for one day. After decomposing the reaction mixture with aqueous ammonium chloride,
there was obtained 20 g. (35%) of \( p \)-methylbenzyl alcohol, m.p. 57.5~58.0\(^\circ\) (ref.\(^{10} 60^\circ\)).

**o-Methylbenzyl alcohol.** From 130g. of \( o \)-bromotoluene there was obtained 38g. (41\%) of \( o \)-methylbenzyl alcohol, m.p. 35~37\(^\circ\) (ref.\(^{20} 36^\circ\)).

**\( p \)-, and \( m \)-Methylbenzyl bromide** were prepared by refluxing of the methylbenzyl alcohols with excess hydrobromic acid in the presence of conc. sulfuric acid.

**\( \alpha \)-Oxo-2,4\(^{'}\)-dimethyldibenzyl.** In 500 ml. three-necked flask equipped with a mercurry-sealed stirrer, a dropping funnel, and a reflux condenser attached with calcium chloride tube, were placed 2.5g. of magnesium turnings and 150ml. of ether. After the Grignard reagent had been prepared by dropping 15g. of \( p \)-methylbenzyl bromide dissolved in 100 ml. of ether, 10 g. of \( o \)-tolunitrile dissolved in 100 ml. of ether was added with stirring. Stirring and refluxing were continued for ten hours. Then the reaction mixture was decomposed with ammonium chloride solution; 100ml. of dil. hydrochloric acid (10\%) was added, and the mixture was stirred for half an hour to hydrolyze the ketimine salt completely. The ether layer dried over anhydrous sodium sulfate, yielded 8.0g. (44\%) of crude \( \alpha \)-oxo-2,4\(^{'}\)-dimethyldibenzyl, b.p. 140~147\(^\circ\) (3mm), which gave a 2,4-dinitrophenylhydrazone melting at 155~157\(^\circ\).
