Received June 26, 1986

Allylsilane 3a synthesized from (−)-isopulegol (1), on treatment with thallium(III) acetate in dichloromethane, undergoes ring opening reaction to give a mixture of diastereoisomers of unsaturated aldehyde 4. On the other hand, the corresponding germanium analog 3b gives allyl acetate 8. The difference of reactivity between these allylmetal(group IVb) compounds toward thallium(III) acetate is discussed in terms of bond energy of each carbon-metal bond.

KEY WORDS: Ring opening reaction/ Allylsilane/ Allylgermane/ Thallium(III) acetate/ Allylthallium(III) compound/

Allylmetal(group IVb) compounds occupy a very important role in synthetic organic chemistry. Allylsilanes bearing a highly nucleophilic double bond act as equivalent species of allyl anion and transfer the allyl group to various kinds of electrophiles including carbonyl compound, α,β-ene, acetal, acid chloride, α-nitro olefin, and exosil in the presence of Lewis acid catalysts. Recently we established a new method for the umpolung of reactivity of allylmetal(group IVb) compounds and applied it to the alkylation reactions of aromatic compounds, alcohols, carboxylic acids, nitriles, and the nitrate group. In the alkylation reactions, allylmetal compounds were converted into highly reactive allyl cationic species, allylthallium(III) or allyliodine(III) compounds, via the reactions with thallium(III) salts such as thallium(III) trifluoroacetate, thallium(III) nitrate, and arythallium bis(trifluoroacetate), or with hypervalent organoiodine(III) compounds.

As one of the application of this alkylation reaction, we have investigated reactions of allylmetal(group IVb) compounds 3 derived from (−)-isopulegol (1) with thallium(III) salts.

Hydroxyl allylsilane 3a was prepared from (−)-isopulegol (1) in a straightforward fashion. Generation of the dianion of 1 [2 equiv. of n-butyllithium and 2 equiv. of tetramethylethylenediamine (TMEDA) in hexane at reflux for 3 h] followed by bis-silylation with chlorotrimethylsilane gave siloxy allylsilane 2a. Chemoselective protodesilylation of 2a using 10% sulfuric acid in tetrahydrofuran (THF) resulted in the formation of the desired hydroxyl allylsilane (3a) in 68% yield (from 1). In order to compare the reactivity of allylmetal compounds toward thallium triacetate
Reaction of Allylmetal (Group IVb) Compounds with Thallium(III) Acetate

In a previous paper we reported that allylsilanes on treatment with TTA undergo an oxidative substitution reaction to give the corresponding allyl acetates in good yields.\(^4\text{a})\) The mode, however, was found to be much altered in the reaction of allylsilane \(3\text{a}\) with TTA. Reaction of \(3\text{a}\) with TTA in refluxing dichloromethane for 4 h gave no simple acetate \(8\), but oxidative ring opening reaction of \(3\text{a}\) was observed. The major product obtained was found to be a 1:1 mixture of two diastereoisomers of unsaturated aldehyde \(4\), in which the trimethylsilyl group of \(3\text{a}\) was kept unchanged. The structure of \(4\) was unambiguously established by its conversion to the known diol \(7\).\(^8\) Reduction of \(4\) with sodium borohydride in methanol at 0°C followed by protodesilylation of the resulting alcohol \(5\) using boron trifluoride-acetic acid complex in dichloromethane at room temperature afforded \(6\) in 62% yield. Alkaline hydrolysis of \(6\) gave diol \(7\) as a mixture of stereoisomers.

In contrast to the facile ring opening of allylsilane \(3\text{a}\) with TTA, allylgermane \(3\text{b}\) undergoes a normal type of reaction; the reaction of \(3\text{b}\) with TTA in dichloromethane at reflux afforded allyl acetate \(8\) via oxidative substitution in high yield. For the confirmation of the structure, allyl acetate \(8\) was converted to the known diol \(9\) (67% yield).\(^9\)

In the oxidative substitution of allylmetal (group IVb) compounds with TTA giving allyl acetates, transient formation of the allyltllium diacetates, which act as species equivalent to allyl cation, was assumed to be involved.\(^4\text{a})\) On the other hand, formation of allyltllium diacetate \(11\) in the reaction of allylsilane \(3\text{a}\) with TTA may be suppressed by the presence of a hydroxyl group on the cyclohexane ring. Electrophilic attack of TTA to \(3\text{a}\) must produce a thallated carbocation \(10\text{a}\), which may be stabilized by hyperconjugative interaction with the adjacent carbon-silicon \(\sigma\) bond. Two possible reaction courses may be considered for the further reaction of the cation \(10\text{a}\): desilylation of \(10\text{a}\) generates allyltllium species \(11\), from which allyl acetate \(8\) may be produced (path A); ring opening of \(10\text{a}\) caused by assistance of the \(\gamma\)-hydroxyl group yields unsaturated aldehyde \(12\text{a}\), which also possesses the highly reactive allyltllium moiety in the molecule and may result in the formation of allyl acetate \(4\) (path B). The exclusive formation of ring opening product \(4\) from \(3\text{a}\) may be attributed to both the favorable steric arrangement between a
vacant p-orbital of cationic carbon and C₁-C₂ bond to be cleaved in the transition state leading to aldehyde 12a and disappearance of the presumed steric interactions between C₁ and C₂ substituents. Allylgermane 3b, however, produced selectively allyl acetate 8, presumably via the formation of 11. These results can be reasonably
explained in terms of bond dissociation energies for carbon-metal (group IVb) bonds:
C-Si (70 kcal. mole⁻¹) and C-Ge (59 kcal. mole⁻¹). Degermylation of 10b, therefore, proceeds selectively and gives allylthallium compound 11.

ACKNOWLEDGEMENTS

The authors are grateful to Mrs. Nakahara, Yamamoto Koryo Co. Ltd., for a gift of a mixture of stereoisomers of 2,6-dimethyl-1-octen-3,8-diol 7.

EXPERIMENTAL SECTION

Melting points were determined with a Yanagimoto micro melting point apparatus and are uncorrected. IR spectra were recorded with a JASCO IR-A-1 spectrophotometer. PMR spectra were obtained with JEOL JNM-FX 100, Hitachi R-40, and Varian XL-300 spectrometers. CMR spectra were taken on JEOL JNM-FX 100 and Varian XL-300 spectrometers. Chemical shifts are reported relative to internal tetramethylsilane. Mass spectra were determined on a Hitachi M-80 double-focusing mass spectrometer. Preparative thin layer chromatography (TLC) was carried out on precoated plates of silica gel (Merck, Silica gel F-254). Kieselgel 60 (Merck) was used for column chromatography.

Materials —— (—)-Isopulegol and thallium(III) acetate are commercially available (Aldrich Chem. Co.).

Synthesis of Allylmetal Compounds —— A Typical Procedure: Hydroxyl Allylsilane 3a: To a solution of (—)-isopulegol (1) (1.0 g, 6.5 mmol) and TMEDA (1.5 g, 13 mmol) in hexane (15 ml) was added dropwise n-butyl lithium (1.55M in hexane, 8.4 ml, 13 mmol) in nitrogen and the mixture was refluxed for 3 h. The resulting red dianion solution was cooled to —78°C and treated with chlorotrimethylsilane (2.1 g, 19.6 mmol). The mixture was allowed to warm to room temperature and stirred for 4 h. After the addition of ice to the mixture, extraction with ether, drying with Na₂SO₄ and then evaporation in vacuo afforded a crude oil of siloxy allylsilane 2a, which was treated with 10% aqueous H₂SO₄ (2 ml) in THF (20 ml) at 0°C for 1 h. After the addition of cold water, the mixture was extracted with ether. A usual work-up gave an oil, which was purified by silica gel column chromatography using hexane-ethyl acetate (9:1) to give hydroxyl allylsilane 3a (1.0 g, 68%). IR νmax cm⁻¹: 3580, 3450, 1620, 1445, 1245, 1040, 850. MS m/z: 226 (M⁺), 211, 193, 169, 143, 121, 93, 75. High-resolution MS: Found 226.1753. Calcd for C₁₃H₂₆O₃Si (M⁺) 226.1753. PMR (CDCl₃) δ: 0.03 ppm (9H, s, SiMe₃), 0.80–1.10 (2H), 0.92 (3H, d, J=6Hz, Me), 1.20–2.15 (9H), 3.50 (1H, dt, J=5, 10 Hz, CHO₂), 4.75 (2H, m, C=CH₂).

Hydroxyl Allylgermane 3b: A crude oil of 2b obtained from the reaction of (—)-isopulegol (1) (1.0 g, 6.5 mmol) with chlorotrimethylgermane (3.0 g, 19.5 mmol) was treated with MeOH (18 ml)-H₂O (2 ml) at room temperature for 1 h. A usual work-up gave an oil, which was purified by silica gel column chromatography using hexane-ethyl acetate (9:1) to afford hydroxyl allylgermane 3b (1.57 g, 89%). IR νmax cm⁻¹: 3570, 3450, 1620, 1445, 1200, 1040, 820. MS m/z: 272 (M⁺), 257, 239,
oxidative ring opening of allylsilane 3a—a solution of hydroxyl allylsilane 3a (315 mg, 1.35 mmol) in dichloromethane (4 ml) was added dropwise to a stirred suspension of TTA (569 mg, 1.35 mmol) in dichloromethane (4 ml) at room temperature in nitrogen. After being refluxed for 4 h, the reaction mixture was poured into cold brine and extracted with ether. A usual work-up and purification of the resulting crude product by silica gel column chromatography using hexane-ethyl acetate (9:1) afforded unsaturated aldehyde 4 (175 mg, 45%), which was contaminated with a small amount of impurity. IR: νmax cm⁻¹: 2820, 2720, 1740 (shoulder), 1730, 1640, 1460, 1370, 1240, 1020, 840. MS m/z: 284 (M⁺), 269, 255, 224, 143, 133, 117 (base peak), 108, 93, 73. PMR (CDCl₃) δ: 0.06 (9H, s, SiMe₃), 0.97, 0.98 (total 3H, each d, J=6Hz, CHMe), 1.0-1.8 (10H), 2.08 (3H, s, COCH₃), 3.66 (2H, t, J=6Hz, CH₂OH), 4.88, 4.94 (each 1H, C=CH₂), 5.14 (1H, t, J=6Hz, CHOAc).

reduction of unsaturated aldehyde 4—to a stirred solution of sodium borohydride (27 mg, 0.7 mmol) in methanol (1 ml) was added dropwise a solution of 4 (20 mg, 0.07 mmol) in methanol (0.5 ml) at 0°C and the mixture was stirred for 1.5 h at 0°C. The reaction mixture was poured into cold water and extracted with ether. A usual work-up and purification by preparative TLC [hexane-ethyl acetate (2:1)] gave alcohol 5 (15 mg, 76%). IR: νmax cm⁻¹: 3620, 3450, 1720, 1630, 1370, 1240, 1040, 840. PMR (CDCl₃) δ: 0.06 (9H, s, SiMe₃), 0.92 (3H, d, J=6Hz, CHMe), 1.0-1.8 (10H), 2.08 (3H, s, COCH₃), 3.66 (2H, t, J=6Hz, CH₂OH), 4.68, 4.86 (each 1H, C=CH₂), 5.08 (1H, t, J=6Hz, CHOAc).

protodesilylation of hydroxyl allylsilane 5—Boron trifluoride-acetic acid complex (11 mg, 0.06 mmol) was added to a solution of 5 (15 mg, 0.05 mmol) in dichloromethane (0.2 ml) at room temperature and the solution was stirred for 5 min. The reaction mixture was poured into a cold aqueous sodium bicarbonate solution and extracted with ether. The extract was washed with water and brine and dried over Na₂SO₄. A usual work-up gave a crude oil, which was purified by preparative TLC [hexane-ethyl acetate (2:1)] to give alcohol 6 (9 mg, 82%). IR: νmax cm⁻¹: 3620, 3450, 1735, 1650, 1450, 1375, 1240, 1020, 900. PMR (CDCl₃) δ: 0.92 (3H, d, J=6Hz, CHMe), 1.0-1.8 (8H), 1.72 (3H, s, CMe), 2.06 (3H, s, COCH₃), 3.66 (2H, t, J=6Hz, CH₂OH), 4.88, 4.94 (each 1H, C=CH₂), 5.14 (1H, t, J=6Hz, CHOAc).

hydrolysis of acetate 6—Acetate 6 (21 mg, 0.1 mmol) was treated with an aqueous NaOH-MeOH solution at room temperature. Purification by preparative TLC [hexane-ethyl acetate (1:1)] produced diol 7a (15 mg, 85%). IR: νmax cm⁻¹: 3620, 3440, 1650, 1460, 3180, 1050, 900. PMR (CDCl₃) δ: 0.90 (3H, d, J=6Hz,
Reaction of Allylmetal (Group IVb) Compounds with Thallium(III) Acetate

CHMe), 1.0-1.8 (7H), 1.70 (3H, s, CMe), 2.00 (2H, br.s, 2×OH). 3.66 (2H, t, J=6Hz, CH₂OH), 4.02 (1H, t, J=6Hz, CHO₃H), 4.80, 4.90 (each 1H, C=CH₂). CMR (CDCl₃) δ: 147.6, 147.5 (each s), 111.1, 110.9 (each t), 76.2, 75.8 (each d), 60.7, 39.7, 32.7, 32.5, 32.3, 32.0 (each t), 29.6, 29.3 (each d), 19.7, 17.6, 17.4 (each q).

Reaction of Hydroxyl Allylgermane 3b with TTA—A solution of 3b (271 mg, 1 mmol) in dichloromethane (3 ml) was added to a stirred suspension of TTA (421 mg, 1 mmol) in dichloromethane (7 ml) at room temperature in nitrogen and the mixture was refluxed for 1 h. After being cooled, the reaction mixture was poured into a cold brine and extracted with ether. A usual work-up and purification of the resulting crude product by silica gel column chromatography using hexane-ethyl acetate (7:1) afforded hydroxyl allylacetalate 8 (183 mg, 86%) IR νmax cm⁻¹: 3575, 3475, 1725, 1640, 1440, 1370, 1220, 1040, 910.
