Continuity properties for logarithmic potentials of functions in Morrey spaces of variable exponent

Takao Ohno
Graduate School of Science, Hiroshima University

1 Introduction

Let $\mathbb{R}^n$ be the $n$-dimensional Euclidean space and $B(x,r)$ denote the open ball centered at $x$ with radius $r$.

Following Kováčik and Rákosník [1], we consider a positive continuous function $p(\cdot)$ on $\mathbb{R}^n$, which is called a variable exponent. For $0 \leq \nu \leq n$, a real number $\beta$ and a locally integrable function $f$ on an open set $\Omega$ in $\mathbb{R}^n$, we define the $L^{p(\cdot),\nu,\beta}(\Omega)$ norm by

$$
\|f\|_{p(\cdot),\nu,\beta,\Omega} = \inf \left\{ \lambda > 0 : \sup_{x \in \Omega, r > 0} r^{-\nu} (\log(2 + r^{-1}))^\beta \int_{\Omega \cap B(x,r)} \frac{|f(y)|^{p(y)}}{\lambda} dy \leq 1 \right\},
$$

where $\beta \geq 0$ when $\nu = 0$ and $\beta \leq 0$ when $\nu = n$. We denote by $L^{p(\cdot),\nu,\beta}(\Omega)$ the space of all measurable functions $f$ on $\Omega$ with $\|f\|_{p(\cdot),\nu,\beta,\Omega} < \infty$. This space $L^{p(\cdot),\nu,\beta}(\Omega)$ is referred to as a generalized Morrey space of variable exponent. In particular, $L^{p(\cdot),0,0}(\Omega)$ is equal to the generalized Lebesgue space $L^{p(\cdot)}(\Omega)$.

In the second section, we consider a function $p(\cdot)$ satisfying a log-Hölder condition such that $p(0) = p_0 \geq 1$,

$$
p(r) = p_0 + \frac{a \log(\log(1/r))}{\log(1/r)} + \frac{b}{\log(1/r)}
$$

for $0 < r < r_0$ and $p(r) = p(r_0)$ for $r \geq r_0$, where the numbers $a$, $b$ and $r_0$ are chosen so that $p(r)$ is nondecreasing on $[0,r_0)$.

For a compact set $K$ in a bounded open set $G$, we define

$$
K(r) = \{x \in G : \delta_K(x) < r\},
$$

where $\delta_K(x)$ denotes the distance of $x$ from $K$. For $0 \leq \alpha \leq n$, we say that the Minkowski $(n - \alpha)$-content of $K$ is finite if

$$
|K(r)| \leq Cr^\alpha \quad \text{for small } r > 0,
$$

where $|E|$ denotes the Lebesgue measure of a set $E$. Note here that if $K$ is a singleton, then its Minkowski 0-content is finite, and if $K$ is a spherical surface, then its Minkowski $(n - 1)$-content is finite. As another examples of $K$, we...
may consider fractal type sets like Cantor sets or Koch curves. Now we define a variable exponent $p(\cdot)$ by

$$p(x) = p(\delta_K(x))$$

for $x \in G$; set $p(x) = p_0$ on $K$.

In the case $\nu = 0$ and $\beta = 0$, we know the following fact (see [3, Remark 4.4]): if the Minkowski $(n-\alpha)$-content of $K$ is finite, then there exists a constant $C > 0$ such that

$$\int_G |f(x)|^{p_0}(\log(1 + |f(x)|))^{\alpha/p_0} \, dx \leq C$$

for all measurable functions $f$ on $G$ with $\|f\|_{p(\cdot),G} \leq 1$. Our first aim in this paper is to give an extension of the above fact to the generalized Morrey space of variable exponent.

In the third section, we consider the logarithmic potential of a locally integrable function $f$ on $\mathbb{R}^n$, which is defined by

$$Lf(x) = \int (\log(1/|x-y|)) f(y)dy.$$ 

Here it is natural to assume that

$$\int (\log(2 + |y|)|f(y)|dy < \infty,$$

which is equivalent to the condition that $-\infty < Lf \neq \infty$ (see [2, Section 2.6]). If $f$ is a locally integrable function on $\mathbb{R}^n$ satisfying (1.1) and

$$\int |f(y)|(\log(2 + |f(y)|))dy < \infty,$$

then it is known that $Lf$ is continuous on $\mathbb{R}^n$ (see [2, Theorem 9.1, Section 5.9]). Our second aim is to study the continuity for logarithmic potentials in Morrey spaces.

In the final section, we consider a positive continuous function $p(\cdot)$ such that $p_0 = 1$. Our final aim is to study the continuity for logarithmic potentials in Morrey spaces of variable exponent.

2 Morrey spaces of variable exponent

Throughout this paper, let $C$ denote various constants independent of the variables in question.
We say that a positive function \( \varphi \) on \((0, \infty)\) is quasi-increasing if there exists a constant \( C > 1 \) such that
\[
\varphi(s) \leq C \varphi(t) \quad \text{whenever } 0 < s \leq t.
\]
A positive function \( \varphi \) is quasi-decreasing if \( \varphi(t)^{-1} \) is quasi-increasing and a positive function \( \varphi \) is quasi-monotone if \( \varphi \) is quasi-increasing or quasi-decreasing. Our typical example of \( \varphi \) is of the form
\[
\varphi(r) = a(\log_{(1)}(1/r))^{b}(\log_{(2)}(1/r))^{c}
\]
for \( r > 0 \), where \( a > 0 \) and \( b, c \in \mathbb{R} \) and \( \log_{(0)} t = e, \log_{(1)} t = \log(e+t) \) and \( \log_{(m+1)} t = \log(e+\log_{(m)} t) \) for \( m = 1, 2, \ldots \). From now on we assume that \( \varphi \) is quasi-monotone on \((0, \infty)\) and there exists a constant \( C_{2} > 1 \) such that
\[
(\varphi 1) \quad C_{2}^{-1}\varphi(r) \leq \varphi(r^{2}) \leq C_{2}\varphi(r) \quad \text{whenever } r > 0,
\]
which implies the doubling condition on \( \varphi \); that is, there exists a constant \( C > 1 \) such that
\[
(\varphi 2) \quad C^{-1}\varphi(r) \leq \varphi(2r) \leq C\varphi(r) \quad \text{whenever } r > 0.
\]

**Lemma 1** [2, Lemma 3.1, Section 5.3]. If \( \gamma > 0 \), then \( t^{\gamma}\varphi(t) \) is quasi-increasing on \((0, \infty)\).

**Lemma 2** There exists a constant \( \kappa_{0} > 0 \) such that \( (\log(2 + t^{-1}))^{-\kappa_{0}}\varphi(t) \) is quasi-increasing on \((0, \infty)\).

**Lemma 3** (cf. [3, Lemma 2.3]). Suppose \( 0 \leq \alpha \leq n \) and the Minkowski \((n-\alpha)\)-content of \( K \) is finite. If \( \psi(t) \) is a quasi-increasing function on \((0, \infty)\) satisfying the doubling condition, then there exists a constant \( C > 0 \) such that
\[
\int_{G \cap B(x,r)} \psi(\delta_{K}(y))^{-1} \, dy \leq C \int_{0}^{4r} t^{\alpha} \psi(t)^{-1} \frac{dt}{t}
\]
for all \( x \in \mathbb{R}^{n} \) and \( r > 0 \).

Consider a positive continuous nonincreasing function \( k \) on \((0, \infty)\) for which there exist \( \varepsilon_{0} \geq 0 \) and \( r_{0} > 0 \) such that
\[
(k) \quad (\log(1/r))^{-\varepsilon_{0}}k(r) \text{ is nondecreasing on } (0, r_{0}).
\]
Further we assume that
\[ k(r_0) \geq e^{e_0}. \]

By (k) we see that
\[ C^{-1}k(r) \leq k(r^2) \leq Ck(r) \quad \text{whenever } 0 < r < r_0, \]
which implies the doubling condition on \( k \). Our typical example of \( k \) is of the form
\[ k(r) = a((\log_{(1)}(1/r))^{b}(\log_{(2)}(1/r))^{c} \]
for \( r \in (0, r_0) \), where \( a > 0 \) and the numbers \( b, c \) and \( r_0 \) are chosen so that \( k(r) \) is nonincreasing on \( (0, r_0) \).

**Lemma 4** [3, Lemma 2.1]. There exists \( 0 < r^* < r_0 \) such that \( \log k(r)/\log(1/r) \) is nondecreasing on \( (0, r^*) \).

In this paper, consider a positive continuous function \( p(\cdot) \) such that
\[ p(x) = p_0 + \frac{\log k(\delta_K(x))}{\log(1/\delta_K(x))} \]
for \( \delta_K(x) < r_0 \) and \( p(x) = p_0 + \log k(r_0)/\log(1/r_0) \) for \( \delta_K(x) \geq r_0 \), where \( p_0 \geq 1 \) and the number \( r_0 \) is chosen so that \( \log k(r)/\log(1/r) \) is nondecreasing on \( [0, \infty) \) (see Lemma 4).

For \( 0 \leq \nu \leq n \) and a locally integrable function \( f \) on \( G \), we define the \( L^{p(\cdot),\nu,\varphi}(G) \) norm by
\[ \|f\|_{p(\cdot),\nu,\varphi,G} = \inf \left\{ \lambda > 0 : \sup_{x \in G, r > 0} r^{-\nu} \varphi(r) \int_{G \cap B(x,r)} \left| \frac{f(y)}{\lambda} \right|^{p(y)} dy \leq 1 \right\}, \]
where \( \varphi(r) \) is quasi-decreasing on \( (0, \infty) \) when \( \nu = 0 \) and \( \lim \sup_{r \to 0} \varphi(r)^{-1} > 0 \) when \( \nu = n \). We denote by \( L^{p(\cdot),\nu,\varphi}(G) \) the space of all measurable functions \( f \) on \( G \) with \( \|f\|_{p(\cdot),\nu,\varphi,G} < \infty \).

The following theorem is an extension of [3, Remark 4.4].

**Theorem 5** (cf. [3, Lemma 2.4]). Suppose \( 0 \leq \nu \leq \alpha \leq n \) and the Minkowski \( (n - \alpha) \)-content of \( K \) is finite. Then there exists a constant \( C > 0 \) such that
\[ \int_{G \cap B(x,r)} |f(y)|^{p_0} k(|f(y)|^{-1})^{(\alpha-\nu)/p_0} dy \leq C r^{\nu} \varphi(r)^{-1} \]
for all \( x \in G, r > 0 \) and measurable functions \( f \) on \( G \) with \( \|f\|_{p(\cdot),\nu,\varphi,G} \leq 1 \).
REMARK 6 We set $\Psi_k(t) = t^{p_0}k(t^{-1})^{(\alpha-\nu)/p_0}$ for $0 \leq t < r_0$; otherwise set $\Psi_k(t) = t^{p_0}k(r_0^{-1})^{(\alpha-\nu)/p_0}$. For $0 \leq \nu \leq n$ and a locally integrable function $f$ on $G$, we define the $L^{\Psi_k,\nu,\varphi}$ norm by

$$\|f\|_{\Psi_k,\nu,\varphi,G} = \inf \left\{ \lambda > 0 : \sup_{x \in G, r > 0} r^{-\nu} \varphi(r) \int_{G \cap B(x,r)} \Psi_k \left( \left| \frac{f(y)}{\lambda} \right| \right) dy \leq 1 \right\},$$

where $\varphi(r)$ is quasi-decreasing on $(0, \infty)$ when $\nu = 0$ and $\limsup_{r \to 0} \varphi(r)^{-1} > 0$ when $\nu = n$. We denote by $L^{\Psi_k,\nu,\varphi}(G)$ the space of all measurable functions $f$ on $G$ with $\|f\|_{\Psi_k,\nu,\varphi,G} < \infty$. We see that $\Psi_k(t)$ satisfies the doubling condition. This implies that $\| \cdot \|_{\Psi_k,\nu,\varphi,G}$ is a quasi-norm. Then it follows from Theorem 5 that

$$\|f\|_{\Psi_k,\nu,\varphi,G} \leq C \|f\|_{p(\cdot),\nu,\varphi,G}$$

whenever $f \in L^{p(\cdot),\nu,\varphi}(G)$.

REMARK 7 For $\alpha > 0$, let $K$ be a compact subset of $G$ such that

$$|K(r)| \leq Cr^\alpha \quad \text{for all } 0 < r < r_0$$

and

$$C^{-1}r^\alpha \leq |K(r) \cap B(x_0,t)|$$

for some $x_0 \in K$ and all $0 < r \leq t < r_0$. Set $\delta(x) = \delta_K(x)$ for simplicity. Let

$$p(x) = p_0 + \frac{a \log(\log_{(m)}(1/\delta(x)))}{\log(1/\delta(x))}$$

for $a > 0$ and an integer $m \geq 0$ when $\delta(x) \leq r_0$; otherwise $p(x) = p_0 + a \log(\log_{(m)}(1/r_0))/\log(1/r_0)$ and

$$\varphi(t) = (\log_{(\ell)}(1/t))^b$$

for an integer $\ell \geq 0$ and $b \in \mathbb{R}$. Then Theorem 5 is the best in the following sense: if $0 < \nu \leq \alpha \leq n$, then we can find $f \in L^{p(\cdot),\nu,\varphi}(G)$ satisfying

$$\int_{G \cap B(x_0,r)} |f(y)|^{p_0}(\log(m)|f(y)|)^{a(\alpha-\nu)/p_0} dy \geq Cr^\nu(\log_{(\ell)}(1/r))^{-b}$$

for all $0 < r < r_0$.

For $\nu = 0$ and $b \geq 0$, we consider the function

$$f(y) = \begin{cases} 
\delta(y)^{-\alpha/p_0} (\log(1/\delta(y)))^{-(b-1)/p_0} (\log_{(m)}(1/\delta(y)))^{-a/\ell} & \text{if } \ell = 1, \\
\delta(y)^{-\alpha/p_0} (\log_{(\ell)}(1/\delta(y)))^{-(b-1)/p_0} (\log_{(m)}(1/\delta(y)))^{-a/\ell} \times \prod_{j=1}^{\ell-1} (\log_{(j)}(1/\delta(y)))^{-1/p_0} & \text{if } \ell \geq 2
\end{cases}$$
for $y \in G$ with $\delta(y) \leq r_0$; set $f(y) = 0$ when $\delta(y) > r_0$. Then we can show that $f \in L^{p(\cdot), \nu, \varphi}(G)$ and
\[
\int_{G \cap B(x_0, r)} f(y)^{p_0} (\log(m) f(y))^{a\alpha/p_0} dy \geq C (\log(r) (1/r))^{-b}
\]
for all $0 < r < r_0$.

**PROPOSITION 8** Suppose $0 \leq \nu \leq \alpha \leq n$. Then there exists a constant $C > 0$ such that
\[
\int_{G \cap B(x, r)} |f(y)|^{p_0} dy \leq Cr^{\nu} \varphi(r)^{-1} k(r)^{-(\alpha - \nu)/p_0}
\]
for all $x \in G$, $r > 0$ and measurable functions $f$ on $G$ satisfying the conclusion of Theorem 5.

**REMARK 9** We set $\Phi_k(t) = \varphi(t)^{-1} k(t)^{-a} \varphi(t)^{-1} k(t)^{-(\alpha - \nu)/p_0}$ for $0 \leq t < r_0$; otherwise set $\Phi_k(t) = \varphi(t)^{-1} k(r_0)^{-(\alpha - \nu)/p_0}$. Proposition 8 implies that
\[
\|f\|_{p_0, \nu, \Phi_k, G} \leq C\|f\|_{\Psi_k, \nu, \varphi, G}
\]
whenever $f \in L^{\Psi_k, \nu, \varphi}(G)$. Moreover, Proposition 8 is seen to be sharp in the following sense: let
\[
k(t) = (\log(m) (1/t))^a
\]
for an integer $m \geq 0$ and $a > 0$ when $t \leq r_0$ and
\[
\varphi(t) = (\log(\ell) (1/t))^b
\]
for an integer $\ell \geq 0$ and $b \in \mathbb{R}$. If $0 < \nu \leq \alpha \leq n$, then we can find $f \in L^{\Psi_k, \nu, \varphi}(G)$ satisfying
\[
\int_{G \cap B(0, r)} |f(y)|^{p_0} dy \geq Cr^{\nu} (\log(\ell) (1/r))^{-b} (\log(m) (1/r))^{-a(\alpha - \nu)/p_0}
\]
for all $0 < r \leq r_0$.

For $\nu = 0$, $b \geq 0$ and integers $1 \leq \ell \leq m$, we consider the function
\[
f(y) = \begin{cases}
|y|^{-a/p_0} (\log(1/|y|))^{-(b-1)/p_0} (\log(m) (1/|y|))^{-a\alpha/p_0} \chi_{B(0, r_0)}(y) & \text{if } \ell = 1, \\
|y|^{-a/p_0} (\log(\ell) (1/|y|))^{-(b-1)/p_0} (\log(m) (1/|y|))^{-a\alpha/p_0} \\
\times \prod_{j=1}^{\ell-1} (\log(\ell) (1/|y|))^{-1/p_0} \chi_{B(0, r_0)}(y) & \text{if } \ell \geq 2.
\end{cases}
\]
Then we can show that $f \in L^{\Psi_k, \nu, \varphi}(G)$ and
\[
\int_{G \cap B(0, r)} f(y)^{p_0} dy \geq C (\log(\ell) (1/r))^{-b} (\log(m) (1/r))^{-a\alpha/p_0}
\]
for all $0 < r \leq r_0$. 
3 Continuity of logarithmic potentials in Morrey spaces

In this section, we deduce the continuity of the logarithmic potential $L_f$. We consider a nondecreasing function $\varphi_1$ on $(0, 1/2]$ and a nonincreasing function $\varphi_2$ on $(0, 1/2]$ such that

$$\varphi_1(r) = \int_0^r \varphi(t)^{-1} \frac{dt}{t} \quad \text{and} \quad \varphi_2(r) = \int_r^1 \varphi(t)^{-1} \frac{dt}{t}$$

for $0 < r \leq 1/2$. We set

$$\Phi(r) = \begin{cases} \varphi_1(r) & \text{if } \nu = 0, \\ \varphi(r)^{-1} & \text{if } 0 < \nu < 1, \\ \varphi_2(r) & \text{if } \nu = 1. \end{cases}$$

REMARK 10 Let $\varphi(t) = (\log(1/t))^\beta$ for $\beta \in \mathbb{R}$. Then

$$\varphi_1(r) = C \begin{cases} (\log(1/r))^{-\beta+1} & \text{if } \beta > 1, \\ \infty & \text{if } \beta \leq 1 \end{cases}$$

and

$$\varphi_2(r) = C \begin{cases} (\log(1/r))^{-\beta+1} & \text{if } \beta < 1, \\ \log(\log(1/r)) & \text{if } \beta = 1, \\ 1 & \text{if } \beta > 1. \end{cases}$$

LEMMA 11 Suppose $0 \leq \nu \leq 1$ and $\varphi_1(1/2) < \infty$ when $\nu = 0$. Then there exists a constant $C > 0$ such that

$$\int_{B(x, \delta)} (\log(\delta/|x-y|)) f(y) dy \leq C \begin{cases} \varphi_1(\delta) & \text{if } \nu = 0, \\ \delta^\nu \varphi(\delta)^{-1} & \text{if } 0 < \nu \leq 1 \end{cases}$$

for all $x \in \mathbb{R}^n$, $0 < \delta < 1/2$ and nonnegative measurable functions $f$ with $\|f\|_{1, \nu, \varphi, \mathbb{R}^n} \leq 1$.

LEMMA 12 Suppose $0 \leq \nu \leq 1$. If $f$ is a nonnegative measurable function satisfying (1.1) and $\|f\|_{1, \nu, \varphi, \mathbb{R}^n} \leq 1$, then

$$\int_{\mathbb{R}^n \setminus B(x, \delta)} |x-y|^{-1} f(y) dy \leq C \begin{cases} \delta^{\nu-1} \varphi(\delta)^{-1} & \text{if } 0 \leq \nu < 1, \\ \varphi_2(\delta) & \text{if } \nu = 1 \end{cases}$$

for all $x \in \mathbb{R}^n$ and $0 < \delta < 1/2$.

Our aim in this section is to establish the following result, which deals with the continuity of logarithmic potentials in Morrey spaces.
THEOREM 13 Assume that $0 \leq \nu \leq 1$ and $\varphi_1(1/2) < \infty$ when $\nu = 0$. If $f$ is a nonnegative measurable function on $\mathbb{R}^n$ satisfying (1.1) and $\|f\|_{1,\nu,\varphi,\mathbb{R}^n} \leq 1$, then $Lf$ is continuous on $\mathbb{R}^n$ and satisfies

$$|Lf(x) - Lf(z)| \leq C|x - z|^\nu \Phi(|x - z|)$$

whenever $0 < |x - z| < 1/2$.

REMARK 14 In the case $\nu = 0$, we need the condition $\varphi_1(1/2) < \infty$ for the H"older continuity of $Lf$.

For this, consider the functions

$$\varphi(t) = \begin{cases} (\log(1/t))^a & \text{if } m = 1, \\ (\log_{(m)}(1/t))^{a} \prod_{j=1}^{m-1} (\log_{(j)}(1/t)) & \text{if } m \geq 2 \end{cases}$$

and

$$f(y) = \begin{cases} |y|^{-n}(\log(1/|y|))^{-2} \chi_{B(0,1)}(y) & \text{if } m = 1, \\ |y|^{-n}(\log(1/|y|))^{-2} \prod_{j=2}^{m} (\log_{(j)}(1/|y|))^{-1} \chi_{B(0,1)}(y) & \text{if } m \geq 2. \end{cases}$$

If $a \leq 1$, then we see that

1. $\int (\log(1/|y|)) f(y) dy = \infty$;
2. $\int_{B(x,r)} f(y) dy \leq C \prod_{j=1}^{m} (\log_{(j)}(1/r))^{-1} \leq C \varphi(r)^{-1}$ for all $x \in \mathbb{R}^n$ and $0 < r < 1/2$.

This implies that $Lf$ is not continuous at the origin.

REMARK 15 Theorem 13 is seen to be sharp in the following sense: let

$$\varphi(t) = (\log_{(m)}(1/t))^a$$

for an integer $m \geq 0$ and $a \in \mathbb{R}$. If $0 < \nu \leq 1$, then we can find $f \in L^{1,\nu,\varphi}(\mathbb{R}^n)$ satisfying

$$|Lf(0) - Lf(x_i)| \geq C|x_i|^\nu \Phi(|x_i|)$$

for some sequence $\{x_i\}$ which tends to the origin. Let

$$\varphi(t) = \begin{cases} (\log(1/t))^a & \text{if } m = 1, \\ (\log_{(m)}(1/t))^{a} \prod_{j=1}^{m-1} (\log_{(j)}(1/t)) & \text{if } m \geq 2 \end{cases}$$

for $a > 1$ and an integer $m \geq 1$. If $\nu = 0$, then we can find $f \in L^{1,\nu,\varphi}(\mathbb{R}^n)$ satisfying

$$|Lf(0) - Lf(x_i)| \geq C(\log_{(m)}(1/|x_i|))^{-a+1}$$

for some sequence $\{x_i\}$ which tends to the origin.
4 Continuity of logarithmic potentials in Morrey spaces of variable exponent

We set
\[ \Phi_K(r) = \begin{cases} \int_0^r \varphi(t)^{-1} k(t)^{-\alpha} \frac{dt}{t} & \text{if } \nu = 0, \\ \varphi(r)^{-1} k(r)^{-(\alpha-\nu)} & \text{if } 0 < \nu < 1, \\ \int_1^r \varphi(t)^{-1} k(t)^{-(\alpha-1)} \frac{dt}{t} & \text{if } \nu = 1. \end{cases} \]

By Theorems 5, 13 and Proposition 8, we have the following result, which deals with the continuity of logarithmic potentials in Morrey spaces of variable exponent.

**Theorem 16** Assume that \(0 \leq \nu \leq 1\), \(\nu \leq \alpha \leq n\) and
\[ \int_0^{1/2} \varphi(t)^{-1} k(t)^{-\alpha} \frac{dt}{t} < \infty \]
when \(\nu = 0\). Let the Minkowski \((n - \alpha)\)-content of \(K\) be finite. If \(f\) is a nonnegative measurable function on \(\mathbb{R}^n\) satisfying \((1.1)\) and \(\|f\|_{p(\cdot),\nu,\varphi,\mathbb{R}^n} \leq 1\), then \(L f\) is continuous on \(\mathbb{R}^n\) and satisfies
\[ |Lf(x) - Lf(z)| \leq C|x - z|^\nu \Phi_K(|x - z|) \]
whenever \(0 < |x - z| < 1/2\).

We set \(A = a(n - \nu) + \beta\),
\[ \Psi(r) = \begin{cases} (\log(1/r))^{-A+1} & \text{if } \nu = 0, \\ (\log(1/r))^{-A} & \text{if } 0 < \nu < 1, \\ (\log(1/r))^{-A+1} & \text{if } \nu = 1 \text{ and } A < 1, \\ \log(\log(1/r)) & \text{if } \nu = 1 \text{ and } A = 1, \\ 1 & \text{if } \nu = 1 \text{ and } A > 1 \end{cases} \]
in case \(n \geq 2\) and
\[ \Psi(r) = \begin{cases} (\log(1/r))^{-A+1} & \text{if } \nu = 0, \\ (\log(1/r))^{-A} & \text{if } 0 < \nu < 1, \\ (\log(1/r))^{-A+1} & \text{if } \nu = 1 \text{ and } \beta \leq 0 \end{cases} \]
in case \(n = 1\).

By Theorem 16 and Remark 10, we have the following result.

**Corollary 17** Let
\[ p(x) = 1 + \frac{a \log(\log(1/|x_0 - x|))}{\log(1/|x_0 - x|)} + \frac{b}{\log(1/|x_0 - x|)} = 1 + \omega_{a,b}(|x_0 - x|) \]
for $x \in B(x_0, r_0)$ and $p(x) = 1 + \omega_{a,b}(r_0)$ for $x \in \mathbb{R}^n \setminus B(x_0, r_0)$, where the numbers $a, b$ and $r_0$ are chosen so that $\omega_{a,b}(r)$ is nondecreasing on $(0, r_0)$ and $p(x) \geq 1$. Assume that $0 \leq \nu \leq 1$ and $A > 1$ when $\nu = 0$. If $f$ is a nonnegative measurable function on $\mathbb{R}^n$ satisfying (1.1) and $\|f\|_{p(\cdot), \nu, \beta, \mathbb{R}^n} \leq 1$, then $Lf$ is continuous on $\mathbb{R}^n$ and satisfies

$$|Lf(x) - Lf(z)| \leq C|x - z|^\nu \Psi(|x - z|)$$

whenever $0 < |x - z| < 1/2$.

We have three remarks for Corollary 17.

**Remark 18** When $\nu = 0$ and $\beta = 0$, we showed that

$$\int_G f(y)(\log(1 + f(y)))^{an}dy < \infty$$

for nonnegative measurable functions $f \in L^p(\mathbb{R}^n)$ (see Theorem 5). It follows from [2, Theorem 9.1, Section 5.9] that if $\nu = 0, \beta = 0$ and $an = 1$, then $Lf$ is continuous on $\mathbb{R}^n$.

**Remark 19** Set $x_0 = 0$. In case $\nu = 0$ and $a > 0$, we need the condition $-an + 1 < \beta$ for the Hölder continuity of $Lf$.

For this, consider the function

$$f(y) = |y|^{-n}(\log(1/|y|))^{-2}\chi_{B(0,1/2)}(y).$$

If $-an + 1 \geq \beta$ and $an \neq 1$ (see Remark 18), then we see that

1. $\int (\log(1/|y|))f(y)dy = \infty$;

2. $\int_{B(x,r)} f(y)^{p(y)}dy \leq C \int_{B(x,r)} |y|^{-n}(\log(1/|y|))^{an-2}dy \leq C(\log(1/r))^{an-1}$ for all $x \in \mathbb{R}^n$ and $0 < r < 1/2$.

This implies that $Lf$ is not continuous at the origin.

Similarly, in case $\nu = 0$ and $a = 0$, we need the condition $\beta > 1$ for the Hölder continuity of $Lf$.

**Remark 20** Set $x_0 = 0$. Corollary 17 is seen to be sharp in the following sense: for $0 < \nu \leq 1$, we can find $f \in L^{p(\cdot), \nu, \beta}(\mathbb{R}^n)$ satisfying

$$|Lf(0) - Lf(x_i)| \geq C|x_i|^\nu \Psi(|x_i|)$$
for some sequence \( \{x_i\} \) which tends to the origin.

Similarly, for \( \nu = 0 \), we can find \( f \in L^{p(\cdot),\nu,\beta}(\mathbb{R}^n) \) satisfying
\[
|Lf(0) - Lf(x_i)| \geq C(\log(1/|x_i|))^{-A+1}
\]
for some sequence \( \{x_i\} \) which tends to the origin.

By Theorem 16, we have the following remark.

**Remark 21** We consider a positive continuous function \( p(\cdot) \) such that
\[
p(x) = 1 + a \frac{\log(\log(1/|x|))}{\log(1/|x|)} + \frac{b}{\log(1/|x|)} = 1 + \omega_{a,b}(|x|)
\]
for \( x \in L(r_0) = \{x = (x_1, x_2, \cdots, x_n) \in \mathbb{R}^n : |x_n| \leq r_0\} \) and \( p(x) = 1 + \omega_{a,b}(r_0) \) for \( x \in \mathbb{R}^n \setminus L(r_0) \), where the numbers \( a, b \) and \( r_0 \) are chosen so that \( \omega_{a,b}(r) \) is nondecreasing on \((0, r_0)\) and \( p(x) \geq 1 \).

We set \( A_L = a(1 - \nu) + \beta \),
\[
\Psi_L(r) = \begin{cases} 
(\log(1/r))^{-A_L+1} & \text{if } \nu = 0, \\
(\log(1/r))^{-A_L} & \text{if } 0 < \nu < 1, \\
(\log(1/r))^{-A_L+1} & \text{if } \nu = 1 \text{ and } A_L < 1, \\
\log(\log(1/r)) & \text{if } \nu = 1 \text{ and } A_L = 1, \\
1 & \text{if } \nu = 1 \text{ and } A_L > 1
\end{cases}
\]
for \( n \geq 2 \).

Assume that \( 0 \leq \nu \leq 1 \) and \( A_L > 1 \) when \( \nu = 0 \). If \( f \) is a nonnegative measurable function on \( \mathbb{R}^n \) satisfying (1.1) and \( \|f\|_{p(\cdot),\nu,\beta, \mathbb{R}^n} \leq 1 \), then \( Lf \) is continuous on \( \mathbb{R}^n \) and satisfies
\[
|Lf(x) - Lf(z)| \leq C|x - z|^{\nu}\Psi_L(|x - z|)
\]
whenever \( 0 < |x - z| < 1/2 \).

But I conjecture that the conclusion of Corollary 17 still holds for this exponent.
