Kyoto University
Blow-up at space infinity for nonlinear heat equations

Noriaki Umeda

Graduate School of Mathematical Sciences,
University of Tokyo
3-8-1, Komaba, Meguro-ku, Tokyo 153-8914, Japan

1 Introduction and main theorems

In this paper we gather the papers [5], [6] and [12] for our talk at Kyoto University. In particular we make the proofs of theorems in [5] easier by using the methods in [12] and other.

We consider solutions of the initial value problem for the equation

\[
\begin{aligned}
&u_t = \Delta u + f(u), \quad x \in \mathbb{R}^n, t > 0, \\
u(x, 0) = u_0(x), \quad x \in \mathbb{R}^n.
\end{aligned}
\] (1)

The nonlinear term \( f \in C^1(\mathbb{R}_+) \) satisfies that

\[
\int_0^\infty \frac{d\xi}{f(\xi)} < \infty \quad \text{with some } C \geq 0,
\] (2)

and

\[
\left\{ \begin{array}{l}
\Phi(v) > 0, \quad \Phi'(v) > 0 \quad \text{and} \quad \Phi''(v) \geq 0 \quad \text{for } v > 0, \\
\int_1^\infty \frac{d\xi}{\Phi(\xi)} < \infty, \\
\text{and } f'(v)\Phi(v) - f(v)\Phi'(v) \geq c\Phi(v)\Phi'(v) \quad \text{for } v > b \\
\text{with some } b \geq 0 \text{ and } c \geq 0.
\end{array} \right.
\] (3)

Remark. The conditions (2) and (3) were used in [12]. They are weaker than the conditions used in [5] and [6]:

\[ f(\delta b) \leq \delta^p f(b) \]

for all \( b \geq b_0 \) and for all \( \delta \in (\delta_0, 1) \) with some \( b_0 > 0 \), some \( \delta_0 \in (0, 1) \) and some \( p > 1 \).
The initial data \( u_0 \) is assumed to be a measureable function in \( \mathbb{R}^n \) satisfying
\[
0 \leq u_0(x) \leq M \text{ a.e. in } \mathbb{R}^n \tag{4}
\]
for some positive \( M \). We are interested in initial data such that \( u_0 \to M \) as \( |x| \to \infty \) for \( x \) in some sector of \( \mathbb{R}^n \). We assume that there exists a sequence \( \{x\} \subset \mathbb{R}^n \) such that
\[
\lim_{m \to \infty} u_0(x + x_m) = M \quad \text{a.e. in } \mathbb{R}^n. \tag{5}
\]

**Remark.** The condition (5) was given in [12]. This condition is equivalent to the condition in [5] with [6]:
\[
\inf_{x \in \tilde{B}_m} (u_0(x) - M_m(x - x_m)) \geq 0 \quad \text{for } m = 1, 2, \ldots,
\]
where \( \tilde{B}_m = B_{r_m}(x_m) \) with a sequence \( \{r_m\} \), a sequence of functions \( \{M_m(x)\} \) satisfying
\[
\lim_{m \to \infty} r_m = \infty, \quad M_m(x) \leq M_{m+1}(x) \quad \text{for } m \geq 1
\]

\[
\lim_{m \to \infty} \inf_{x \in [1, r_m]} \frac{1}{|B_s|} \int_{B_s(0)} M_m(x) dx = M,
\]
and some sequence of vectors \( \{x_m\} \). Here \( B_r(x) \) denotes the opened ball of radius \( r \) centered at \( x \).

Problem (1) has a unique bounded solution at least locally in time. However, the solution may blow up in finite time. For a given initial value \( u_0 \) and nonlinear term \( f \) let \( T^* = T^*(u_0, f) \) be the maximal existence time of the solution. If \( T^* = \infty \), the solution exists globally in time. If \( T^* < \infty \), we say that the solution blows up in finite time. It is well known that
\[
\limsup_{t \to T^*} \|u(\cdot, t)\|_{\infty} = \infty, \tag{6}
\]
where \( \| \cdot \|_{\infty} \) denotes the \( L^\infty \)-norm in space variables.

In this paper we are interested in behavior of a blowing up solution near space infinity as well as location of blow-up directions defined below. A point \( x_{BU} \in \mathbb{R}^n \) is called a **blow-up point** if there exists a sequence \( \{(x_m, t_m)\} \) such that
\[
t_m \uparrow T^*, \quad x_m \to x_{BU} \quad \text{and} \quad u(x_m, t_m) \to \infty \quad \text{as } m \to \infty.
\]
If there exists a sequence \( \{(x_m, t_m)\}_{m=1}^{\infty} \) such that
\[
t_m \uparrow T^*, \quad |x_m| \to \infty \quad \text{and} \quad u(x_m, t_m) \to \infty \quad \text{as} \quad m \to \infty,
\]
then we say that the solution blows up to at space infinity.

A direction \( \psi \in \mathbb{S}^{n-1} \) is called a blow-up direction if there exists a sequence \( \{(x_m, t_m)\}_{m=1}^{\infty} \) with \( x_m \in \mathbb{R}^n \) and \( t_m \in (0, T^*) \) such that \( u(x_m, t_m) \to \infty \) as \( m \to \infty \) and
\[
\frac{x_m}{|x_m|} \to \psi \quad \text{as} \quad m \to \infty.
\]

We consider the solution \( v(t) \) of an ordinary differential equation
\[
\begin{cases}
  v_t = f(v), & t > 0, \\
  v(0) = M.
\end{cases}
\]

Let \( T_v = T^*(M, f) \) be the maximal existence time of solutions of (8), i.e.,
\[
T_v = \int_{M}^{\infty} \frac{ds}{f(s)}.
\]

We are now in position to state our main results.

**Theorem 1.** Assume that \( f \in C^1(\mathbb{R}_+) \) is nondecreasing function and locally Lipschitz in \( \mathbb{R}_+ \). Let \( u_0 \) be a continuous function satisfying (4) and (5). Then there exists a subsequence of \( \{x_m\}_{m=1}^{\infty} \), independent of \( t \) such that
\[
\lim_{m \to \infty} u(x + x_m, t) = v(t) \quad \text{in} \quad \mathbb{R}^n.
\]

The convergence is uniform in every compact subset of \( \mathbb{R}^n \times [0, T_v) \). Moreover, the solution blows up at \( T_v \).

For this theorem we should introduce the results of Gladkov [7]. In his paper there is the result [7, Theorem 1] relative to our first theorem. He considered the initial-boundary value problem:
\[
\begin{cases}
  u_t = u_{xx} + f(x, t, u), & x > 0, 0 < t < T_0, \\
  u(x, 0) = u_0(x), & x > 0, \\
  u(0, t) = \mu(t) & 0 < t < T_0,
\end{cases}
\]

and the ordinary differential equation
\[
\begin{cases}
  v_t = \tilde{f}(t, u), & 0 < t < T_0, \\
  v(0) = M,
\end{cases}
\]
where $T_0 \in (0, \infty]$, $0 \leq f(x, t, u) \leq \tilde{f}(t, u)$, $\lim_{x \to \infty} f(x, t, u) = \tilde{f}(t, u)$, $0 \leq u_0 \leq M$ and $\lim_{x \to \infty} u_0(x) = M$. For the equations he had $u(x, t) \to v(t)$ as $x \to \infty$ uniformly for $[0, T]$ with $T < T_0$. For the proof of this result, he used the fundamental solution of the heat equation.

In [5] the expression (9) was the weak sense:

$$\lim_{n \to \infty} u(x_m, t) = v(t).$$ (10)

After [5], (9) was used in [12]. However, for proving Theorems 2 and 3, we can select even the expression (10).

Our second main result is on the location of blow-up points.

**Theorem 2.** Assume the same hypotheses of Theorem 1 and that $f$ satisfies (2) and (3). Let $u_0 \not\equiv M$ a.e. in $\mathbb{R}^n$. Then the solution of (1) has no blow-up points with $\infty$ in $\mathbb{R}^n$. (It blows up only at space infinity.)

There is a huge literature on location of blow-up points since the work of Weissler [15] and Friedman-McLeod [1]. (We do not intend to list references exhaustively in this paper.) However, most results consider either bounded domains or solutions decaying at space infinity; such a solution does not blow up at space infinity [2].

As far as the authors know, before the result of [4] the only paper discussing blow-up at space infinity is the work of Lacey [8]. He considered the Dirichlet problem in a half line. He studied various nonlinear terms and proved that a solution blows up only at space infinity. His method is based on construction of suitable subsolutions and supersolutions. However, the construction heavily depends on the Dirichlet condition at $x = 0$ and does not apply to the Cauchy problem even for the case $n = 1$.

As previously described, the Giga-Umeda [4] proved the statement of Theorems 1 and 2 assuming that $\lim_{|x| \to \infty} u_0(x) = M$ for positive solutions of $u_t = \Delta u + u^p$. Later, Simojö[13] had the same results as in [4] by relaxing the assumptions of initial data $u_0 \geq 0$ which is similar to that in the present paper. His approach is a construction of a suitable supersolution which implies that $a \in \mathbb{R}^n$ is not a blow-up point. Although he restricted himself for $f(s) = s^p$, his idea works our $f$ under slightly strong assumption on $u_0$. Here we give a different approach.

By Simojö’s results[13] it is natural to consider a problem of “blow-up direction” defined in (7). We next study this “blow-up direction” for the value $\infty$.

**Theorem 3.** Assume the same hypotheses of Theorem 1. Let a direction $\psi \in S^{n-1}$. If and only if there exists sequences $\{y_m\}_m^{\infty}$ and satisfying
\[
\lim_{m \to \infty} \frac{y_m}{|y_m|} = \psi \text{ such that }
\lim_{m \to \infty} u_0(x + y_m) = M \text{ a.e. in } \mathbb{R}^n,
\]
(11)

then \(\psi\) is a blow-up direction.

After [5] there are some results in this field. Shimojō had the result of the upperbound and the lowerbound:

\[v(t - \eta(x, t)) \leq u(x, t) \leq v(t - c\eta(x, t))\]

with some function \(\eta\) and \(c \in (0, 1)\). Moreover, he proved the complete blow-up of the solution. Seki-Suzuki-Umeda [12] and Seki [11] improved the results of [5] for the quasilinear parabolic equation:

\[u_t = \Delta \varphi(u) + f(u).\]

In particular they had more results for more general case. In [3] some of the proofs of theorems in [5] were corrected.

This paper is organized as follows. In section 2 we prove Theorem 1 by using the fundamental solution of the heat equation. The proof of Theorem 2 is given in section 3 by using the argument used in [12]. In section 4 we show Theorem 3 using Theorem 1 and Lemma 3.2.

### 2 Behavior at space infinity

In this section we prove Theorem 1. We give proof of Theorem 1 which is inspired in private communication with Y. Seki and M. Shimojō.

**Proof of Theorem 1.** Put \(w = v - x\). Then, we have for \(t \in (0, T_0]\) with \(T_0 \in (0, T(M))\),

\[w_t = \Delta w + f(v(t)) - f(u(\cdot, t)) \leq \Delta w + C(v - u),\]

where

\[C = \sup_{t \in [0, T_0]} \left\| \int_0^1 f'(\theta v(t) + (1 - \theta)u(\cdot, t))d\theta \right\|_{\infty}.
\]

Then, by comparison we obtain

\[w(x, t) \leq e^{CT_0} e^{\Delta t}(M - u_0(x)) = \frac{1}{(4\pi t)^{n/2}} \int_{\mathbb{R}^n} e^{-|x-y|^2/4t}(M - u_0(y))dy.
\]
From (5) we have
\[
\lim_{m \to \infty} u(x + x_m, t) = v(t) \quad \text{in } \mathbb{R}^n.
\] (12)

It remains to prove that \( u \) blows up at \( t = T_v \). For this purpose it suffices to prove that \( \lim_{m \to \infty} u(x_m, t_m) = \infty \) for some sequence \( t_m \to T_v \). We argue by contradiction. Suppose that \( \lim_{m \to \infty} u(x_m, t_m) \leq C \) for some \( C \in [M, \infty) \). Then we could take \( t_0 \in (0, T_v) \) satisfying \( v(t_0) \geq C \) and \( v_t(t) > 0 \) for \( t \geq t_0 \).

By (12) we have
\[
\lim_{m \to \infty} u(x_m, \frac{t_0 + T_v}{2}) = v\left(\frac{t_0 + T_v}{2}\right) > C,
\]
which yields a contradiction. We thus proved that \( \lim_{m \to \infty} u(x_m, t_m) = \infty \), so that \( u(x, t) \) blows up at \( T_v \).

\[\square\]

3 No blow-up point in \( \mathbb{R}^n \)

In this section we prove Theorem 2. We use three lemmas for proving the theorem.

**Lemma 3.1.** Assume the same hypothesis of Theorem 1. Let \( u \) and \( v \) be solutions of (1) and (8) with \( u_0, M \) and \( f \) satisfying (2), (3) and (4). Then there exist \( \delta = \delta(a, t_0, u_0, f) \in (0, 1) \) such that for \( (x, t) \in B_1(a) \times [t_0, T_v) \),
\[
u(x, t) \leq \delta v(t)
\]
with \( t_0 \in [0, T_v) \).

**Proof.** By (2) there exist \( M_f = M_f(f) > M \) and \( \delta_f = \delta_f(f) \in (0, 1) \) satisfying for \( r \geq M_f \) and \( \delta \in (\delta_f, 1) \),
\[
f(\delta r) \leq \delta f(r).
\] (13)

Let \( T_0 = T_0(u_0, f) \in (0, T_v) \) such that \( v(T_0) = M_f \). Since \( u_0 \leq M \) and \( u_0 \neq M \) a.e. in \( \mathbb{R}^n \), we have \( u(x, T_0) < v(T_0) \). Note that \( u(x, t) < v(t) \) for \( t \in (0, T_0) \). Let \( w \) be the solution of
\[
\begin{cases}
w_t = \Delta w, \\
w(x, T_0) = \max\{u(x, T_0)/v(T_0), \delta_f\},
\end{cases} \quad x \in \mathbb{R}^n, t \in (T_0, T^*),
\]
with \( \delta \in (\delta_f, 1) \).

Put \( \bar{u} = vw \). Then we have
\[
\begin{cases}
\bar{u}_t = \Delta \bar{u} + w f(v), \\
\bar{u}(x, T_0) = \max\{u(x, T_0), \delta_f v(T_0)\},
\end{cases} \quad x \in \mathbb{R}^n, t \in (T_0, T^*),
\]
Since $w(x, t) \in [\delta_f, 1)$ and $v(t) \geq M_f$, we have

$$wf(v) \geq f(wv) = f(\bar{u})$$

by (13). This $\bar{u}$ is supersolution of (1).

Since for any $x \in \mathbb{R}^n$, $\sup_{t \in [T_0,T_v)} w(x, t) < 1$, we can take $\delta = \delta(a, T_0, u_0, f) \in (0, 1)$ satisfying $w(x, t) \leq \delta$ for $(x, t) \in B_1(a) \times [T_0, T_v)$. Thus, we obtain

$$u(x, t) \leq \bar{u}(x, t) = w(x, t)v(t) \leq \delta v(t)$$

and Lemma 3.1 is proved.

For any $a \in \mathbb{R}^n$, we consider the solution $\phi = \phi_a$ of the equation:

\[
\begin{cases}
\phi_t = \Delta \phi + f(\phi), & x \in B_1, t \in (t_1, T_v), \\
\phi(x, 0) = \phi_0(x), & x \in B_1, \\
\phi(x, t) = v(t), & x \in \partial B_1, t \in (t_1, T_v),
\end{cases}
\]

where $\phi_0(x) = v(t_1)(1 - \epsilon \cos \frac{\pi |x|}{2})$ with $\epsilon = \epsilon(u_0, f, a) > 0$ sufficiently small satisfying

$$\phi_0(x) \geq u(x+a, t_1) \quad (15)$$

and $B_1$ denotes the open ball of radius 1 and centered at 0. It is easily seen that

$$\Delta \phi_0(x) + f(\phi_0(x)) \geq 0.$$ 

By the maximum principle [10] we have

$$\phi(x, t) \geq u(x+a, t) \quad \text{and} \quad \phi_t \geq 0 \quad \text{for} \quad x \in \bar{B}_1, \ t \in [t_1, T_v). \quad (16)$$

If $w$ has no blow-up point in $\mathbb{R}^n$, the $u$ has no blow-up point in $\mathbb{R}^n$, neither. We should show that $w$ has no blow-up point.

**Lemma 3.2.** Assume the same hypotheses of Lemma 3.1. Let $\Omega \in B_1$ be a domain. If $\partial_t \phi(x, t) \geq 0$ in $\Omega \times (t_1, T_v)$ and there exist $\nu \in S^{n-1}$ and $\delta > 0$, such that

$$\nu \cdot \nabla \phi(x, t) \leq -\delta |\nabla \phi(x, t)| < 0 \quad \text{in} \ \Omega \times (t_1, T_v),$$

then $\phi$ does not uniformly blow-up in $\Omega$:

$$\inf_{x \in \Omega} \phi(x, t) \leq L < \infty \quad \text{for} \ t \in (t_1, T_v).$$

Proof of Lemma 3.2. This lemma is proved in [9] (See [9, Lemma 4.1]). □

Proof of Theorem 2. Put $r \in (0, 1)$. Define

$$
\mu(x, t) = \phi(2r - x_1, x', t) - \phi(x_1, x', t),
$$

where $x = (x_1, x')$ with $x' = (x_2, x_3, \ldots, x_n) \in \mathbb{R}^{n-1}$. Then, we obtain

$$
\begin{cases}
\mu_t \geq \Delta \mu + C(x, t)\mu, & x \in D_r, t \in (t_1, T_v), \\
\mu(x, 0) = \phi_0(2r - x_1, x') - \phi_0(x_1, x') \geq 0, & x \in D_r, \\
\mu(x, t) \geq 0, & x \in \partial D_r, t \in (t_1, T_v),
\end{cases}
$$

where

$$
C(x, t) = \int_0^1 \{\theta \phi(2r - x_1, x', t) + (1 - \theta)\phi(x_1, x', t)\} \, d\theta
$$

and

$$
D_r = \{x : x_1 < r\} \cap \{x : (x - 2r)^2 < 1\}.
$$

Thus, by the maximum principle [10] we have

$$
\mu \geq 0 \quad \text{in} \quad D \times [t_1, T_v)
$$

and

$$
\phi(2r - x_1, x', t) \geq \phi(x_1, x', t) \quad \text{in} \quad D \times [t_1, T_v).
$$

Since $r \in (0, 1)$ is arbitrary, we obtain that $\phi_{x_1} \geq 0$ for $x \in \{x| x_1 > 0\}$ and

$$
-e_1 \cdot \nabla \phi \leq -\phi_{x_1} \leq -\frac{\delta x_1}{|x|} |\nabla \phi|, \quad \text{in} \quad D \cup \{x| x_1 \geq 0\}
$$

with some $\delta > 0$, where $e_1 = (1, 0, 0, \ldots, 0)$. Since $\phi_t \geq 0$ and $\inf_{x \in B_1} \phi(x, t) = \phi(0, t)$, by Lemma 3.2 we have

$$
\lim_{t \to T_v} \phi(0, t) \leq L \quad \text{with some} \quad L < \infty.
$$

Thus

$$
\lim_{t \to T_v} u(a, t) \leq L \quad \text{with same} \quad L.
$$

Since $a \in \mathbb{R}^n$ is arbitrary, $u$ does not blow up at $t = T_v$ in $\mathbb{R}^n$. □
4 On blow-up direction

We shall prove Theorem 3 which gives a condition for blow-up direction.

Proof of Theorem 3. We first prove that if \( u_0 \) satisfies (11), then \( \psi \) is a blow-up direction. By assumption we obtain that \( u_0(x) \) satisfies (5) with some sequences \( \{x_m\}_{m=1}^\infty \) satisfying \( \lim_{m \to \infty} x_m/|x_m| = \psi \). Then, from the proof of Theorem 1 it follows that

\[
\lim_{m \to \infty} u(x_m, t_m) = \infty
\]

with the sequence \( \{t_m\}_{m=1}^\infty \) satisfying \( \lim_{m \to \infty} t_m = T_v \). Since \( \lim_{m \to \infty} x_m/|x_m| = \psi \) by the assumption we obtain that \( \psi \) is a blow-up direction.

We next show that if \( \psi \) is a blow-up direction, then there exist \( \{x_m\}_{m=0}^\infty \subset \mathbb{R}^n \) such that \( x_m/|x_m| \to \psi \), \( t_m \to T_v \) and \( u(x_m, t_m) \to \infty \) as \( m \to \infty \). In contrary it says that if for any sequences \( \{x_m\}_{m=1}^\infty \subset \mathbb{R}^n \) satisfying \( \lim_{m \to \infty} x_m/|x_m| = \psi \), \( u_0 \) does not satisfy (11), then \( \psi \) is not a blow-up direction.

Since \( \lim_{m \to \infty} u_0(x + x_m) = M \) a.e. in \( \mathbb{R}^n \), we have

\[
\lim_{m \to \infty} \sup_{x \in B_\delta(x_m)} \frac{1}{(4\pi t)^{n/2}} \int_{\mathbb{R}^n} e^{-(x-y)^2/4t} u_0(y) dy < M
\]

for \( t > 0 \). Since the solution of (1) satisfies the integral equation

\[
u(x, t) = \int_0^t \int_{\mathbb{R}^n} \frac{1}{(4\pi t)^{n/2}} e^{-(x-y)^2/4t} f(u(x, s)) ds \]

we have

\[
u(x, t) \leq e^{At} u_0(x) + \int_0^t f(v(s)) ds
\]

for \( (x, t) \in \mathbb{R}^n \times [0, T^*] \).

Let \( M_f, \delta_f \) and \( T_0 \) be the same as proof of Lemma 3.1. We consider the solution \( w \) of

\[
\begin{cases}
  \frac{\partial w}{\partial t} = \Delta w, \\
  w(x, T_0) = \max\left\{ \frac{v(T_0) - M + e^{At_0} u_0(x)}{v(T_0)}, \delta_f \right\}
\end{cases}
\]

\( x \in \mathbb{R}^n, t \in (T_0, T_v) \),

\[
\begin{cases}
  \frac{\partial w}{\partial t} = \Delta w, \\
  w(x, T_0) = \max\left\{ \frac{v(T_0) - M + e^{At_0} u_0(x)}{v(T_0)}, \delta_f \right\}
\end{cases}
\]

\( x \in \mathbb{R}^n \).

We now introduce \( \tilde{u} = vw \). From the proof of Lemma 3.1, it follows that \( \tilde{u} \geq u \) for \( (x, t) \in \mathbb{R}^n \times [T_0, T^*] \). Then we have

\[
u(x, t) \leq v(t) e^{At - T_0} \max\left\{ \frac{v(T_0) - M + e^{At_0} u_0(x)}{v(T_0)}, \delta_f \right\}
\]
for \((x, t) \in \mathbb{R}^n \times [T_0, T_v)\).

Put \(U_m = \sup_{x \in B_2(x_m)} e^{T_0} u(x)\). From (17), there exists \(M_0 \in (0, M)\) such that

\[
\lim_{m \to \infty} U_m \leq M_0(< M).
\]

There exists a sequence \(\{V_k\}_{k=1}^\infty\) such that \(V_k = (M_0 + M)/2\), \(\lim_{k \to \infty} V_k = M_0\) \(V_{k+1} \leq V_k\) and \(V_k \geq U_{m_k}\) with a sequence \(\{m_k\}_{k=1}^\infty\) satisfying \(u_{k+1} > u_k\) for \(k \in \mathbb{N}\). Thus, since \((x - y)^2 \leq 2x^2 + 2y^2\), we obtain

\[
\sup_{x \in B_1(\tilde{x}_k)} w(x, t) \leq W_k(t)
\]

\[
= e^{\Delta(t-T_0)} \max \left\{ \frac{v(T_0) - (M - V_k)e^{-|x|^2/2t} \int_{|y|<2} e^{-|y|^2/2t} u_0(y) dy}{(4\pi T_0)^{-n/2} v(T_0)}, \delta_f \right\} < 1
\]

for \(t \in [T_0, T_v)\), where \(\tilde{x}_k = x_{m_k}\). By comparison we have \(W_{k+1}(t) \leq W_k(t)\) for \(t \in [T_0, T_v)\) and \(k \in \mathbb{N}\). From Lemma 3.2 and comparison it follows that there exist the sequence \(\{\eta_k\}_{k=1}^\infty\) satisfying \(0 < \eta_{k+1} \leq \eta_k < \infty\) such that

\[
\lim_{t \to T_v} u(x_{m_k}, t) \leq \eta_k.
\]

Since the sequence \(\{x_m\}_{m=1}^\infty\) is arbitrary, we obtain that \(\psi\) is not blow-up direction. \(\square\)

Acknowledgement. The author is grateful to Mr. Yukihiro Seki and Mr. Masahiko Shimojo for their discussions on Theorems 1 and 2 in this paper. Much of the work of the author was done while he visited the University of Tokyo during 2005-2008 as a postdoctoral fellow. Its hospitality is gratefully acknowledged as well as support from formation of COE "New Mathematical Development Center to Support Scientific Technology", supported by JSPS.
