Kyoto University
THE FAST AND SLOW GROWING HIERARCHIES
AND THE INDUCTIVE DEFINITIONS

Noriya Kadota
(角田 法也, 広島大学, 应用数学)

§0. INTRODUCTION

The aim of subrecursive hierarchy theory is to assign ordinal notations to computable functions in such a way as to reflect their computational complexity. We shall consider here, as the complexity measure, the termination proofs of some algorithms for computing them, in particular, the proofs given in $\text{ID}_{<\omega} (= \cup_{\nu<\omega} \text{ID}_{\nu})$; the theory of finitely iterated inductive definitions).

Then the function whose termination proof is given in $\text{ID}_{<\omega}$ is called provably computable in $\text{ID}_{<\omega}$.

On the relation between termination proofs and subrecursive hierarchies, Wainer[15],[16] introduced a subrecursive inaccessible ordinal $\tau$, so that for $x > 0$,

$$G_{\tau}(x) < F_{\tau}(x) \leq G_{\tau}(x+1)$$

where $G_{\tau}$ and $F_{\tau}$ are the slow and fast-growing functions at $\tau$, respectively. This means that the slow-growing hierarchy catches up with the fast-growing one at stage $\tau$. Then he stated that the ordinal height of $\tau$ is $\sup \{|\text{ID}_{\nu}| : \nu<\omega\}$ where $|\text{ID}_{\nu}|$ is the proof-theoretic ordinal of $\text{ID}_{\nu}$, based on the results of Girard[8].

In this article, we shall demonstrate the following (I)²(III)
on the relation between termination proofs in ID\(_{<\omega}\) and the slow and fast-growing hierarchies:

(I) We introduce an ordinal \(\tau'\) such that for \(x > 3\),

\[G_{\tau'}(x) < F_{\tau'}(x) \leq G_{\tau'}(G_{\tau'}(x)).\]

This means also that the slow-growing hierarchy catches up with the fast-growing hierarchy at \(\tau'\). The reason why we change the definition of \(\tau\) is to show the collapsing lemma in Section 5.

(II) For each \(\alpha < \tau'\), the function \(F_{\alpha}\) is provably computable in ID\(_{<\omega}\).

(III) If a computable function \(f: \omega \rightarrow \omega\) is provably computable in ID\(_{<\omega}\), then \(f\) is dominated by \(F_{\alpha}\) for some \(\alpha < \tau'\) (i.e., there is an \(m < \omega\) such that \(f(x) < F_{\alpha}(x)\) for \(x > m\)).

Our demonstration here is based on the results of Buchholz[4] on the functions provably computable in ID\(_{\psi}(\psi < \omega)\). On the other hand, Arai[2] had already studied these functions by means of the slow-growing hierarchy. Here we shall first prove the relation of (I) which is a direct estimation of the fast-growing function at \(\tau'\) by the slow-growing hierarchy at \(\tau'\), following the idea of [16]; secondly, we shall prove (II) and (III) which imply that \(\tau'\) corresponds to the proof-theoretic ordinal of ID\(_{<\omega}\). Moreover, we shall consider only the case of ID\(_{\psi}\) where \(\psi < \omega\). The author does not know how to construct \(\tau'\) which implies (I) and corresponds to the proof-theoretic ordinal of ID\(_{\omega}\).
§1. A SUBRECURSIVE INACCESSIBLE ORDINAL $\tau'$

1A. In this section, we shall introduce a (tree-) ordinal $\tau'$ and prove that

\[(I) \quad G_{\tau'}(x) < F_{\tau'}(x) \leq G_{\tau'}(G_{\tau'}(x)) \quad \text{for} \quad x > 3.\]

The definition of $\tau'$ is slightly changed from that of $\tau$ in [15], [16]. The reason why we change the definition of $\tau$ is to apply directly Buchholz' method in [4] to our case; we need this change to prove the collapsing lemma of Section 5.

In the following, the letters $k$, $m$, $n$, $p$, $x$ denote non-negative integers.

1B. TREE ORDINALS AND $(p)$-BUILT-UPNESS. The hierarchies of number-theoretic functions considered here are defined by recursions over the set of countable ordinals which has an assignment of fundamental sequences at limit stages. For a countable limit ordinal $\lambda$, we call $<\lambda[x]>_{x<\omega}$ a fundamental sequence for $\lambda$ when it satisfies:

(i) $\lambda[0] < \lambda[1] < \lambda[2] < \cdots < \lambda,$

(ii) $\sup\{\lambda[x]: x < \omega\} = \lambda.$

Following [6], here we shall define the set $\Omega$ of countable tree-ordinals which is constructed by assigning the arbitrary chosen fundamental sequences at limit stages as follows:

**DEFINITION 1.1** (Countable tree-ordinals). The set $\Omega$ of the countable tree-ordinals consists of the infinitary terms generated inductively by:
(1) \(0 \in \Omega\).

(11) If \(\alpha \in \Omega\), then \(\alpha + 1 \in \Omega\).

(iii) If \(\alpha_x \in \Omega\) for all \(x < \omega\), then \((\alpha_x)_x < \omega \in \Omega\).

For a given \(\alpha \in \Omega\) such that \(\alpha = (\alpha_x)_{x < \omega}\), we call \(\alpha\) 'limit' and write \(\alpha[x]\) for \(\alpha_x\). According to the inductive definition of \(\Omega\), proofs and definitions will usually be by induction over the well-founded 'sub-tree' partial ordering on \(\Omega\) which is denoted \(\prec\) and defined as the transitive closure of

- (1) \(0 \not\prec \beta\),
- (11) \(\beta \prec \beta + 1\),
- (iii) \(\beta[x] \prec \beta\) for all \(x < \omega\) if \(\beta\) is limit.

In order to ensure that \(\prec\)-predecessors of \(\alpha\) are linearly and hence well-ordered, and to develop basic domination properties; we need to restrict attention to tree-ordinals \(\alpha\) possessing additional structure.

**DEFINITION 1.2 ((p)-built-up tree-ordinals).** For a given \(p < \omega\), the subset \(\Omega^{(p)}_{\text{bu}} \subseteq \Omega\) of \((p)\)-**built-up** tree-ordinals consists of those \(\alpha \in \Omega\) satisfying that:

\[\lambda[x] \prec_p \lambda[x+1] \text{ for all limit } \lambda \preceq \alpha \text{ and } x < \omega,\]

where the relation \(\prec_p\) on \(\Omega\) is defined as the transitive closure of

- (1) \(0 \not\prec_p \beta\),
- (11) \(\beta \prec_p \beta + 1\),
- (iii) \(\beta[p] \prec \beta\) if \(\beta\) is limit.

Built-upness and the other related notions on fundamental sequences are studied in [1],[11],[12],[13]. In [16], Wainer used the notion of structuredness (or niceness in [6]) as bases
to develop his theory of subrecursive inaccessible ordinals. From the author and Aoyama's study of [11], we can prove the same results to Wainer[16] when we use the notion of \((p)\)-built-upness instead of the structuredness.

**Lemma 1.3.** Let \(p < \omega\) and \(\alpha \in \Omega^{(p)}_{-bu}\). Then the following hold.

1. \(\beta <_m \alpha \) and \(p \leq m < n\), then \(\beta <_n \alpha\).
2. \(\beta < \alpha\), then \(\beta <_m \alpha\) for some \(m < \omega\).
3. \(p \leq m\) and \(\beta <_m \alpha\), then \(\beta + 1 \leq_{m + 1} \alpha\).

**Proof.** By induction on \(\alpha\). See Lemma 2.3 and Cor. 2.8 in [11]. \(\Box\)

**Proposition 1.4 ([16]).** For each \(p < \omega\) and \(\alpha \in \Omega^{(p)}_{-bu}\), the set \(\{\gamma : \gamma < \alpha\}\) is linearly and hence well-ordered by \(<\). Furthermore, if \(\gamma < \alpha\) then \(\gamma + 1 \not\leq \alpha\).

**Proof:** If \(\gamma < \alpha\) and \(\delta < \alpha\), choose any \(m\) such that \(\gamma <_m \alpha\) and \(\delta <_m \alpha\). Then we have \(\gamma = \delta\) or \(\gamma <_m \delta\) or \(\delta <_m \gamma\). Hence we have \(\gamma = \delta\) or \(\gamma < \delta\) or \(\delta < \gamma\). Furthermore, if \(\gamma < \alpha\), then \(\gamma <_m \alpha\) for some \(m < \omega\). Hence \(\gamma + 1 \leq_{m + 1} \alpha\) by 1.3. Therefore \(\gamma + 1 \not\leq \alpha\). \(\Box\)

**1. Hierarchies** \(\{F^\alpha\}_{\alpha \in \Omega}\), \(\{G^\alpha\}_{\alpha \in \Omega}\), \(\{F'^\alpha\}_{\alpha \in \Omega}\). We define the fast-growing \(\{F^\alpha\}_{\alpha \in \Omega}\) and slow-growing \(\{G^\alpha\}_{\alpha \in \Omega}\) hierarchies as follows:

\[
\begin{align*}
F^0_0(x) &= x + 1, & G^0_0(x) &= 0, \\
F^{\alpha + 1}_\alpha(x) &= F^x_\alpha(F^\alpha_\alpha(x)), & G^{\alpha + 1}_\alpha(x) &= G^\alpha_\alpha(x) + 1, \\
F^\lambda_\lambda(x) &= F^{[\lambda]}_\lambda(x), & G^\lambda_\lambda(x) &= G^{[\lambda]}_\lambda(x),
\end{align*}
\]

where \(\lambda\) is limit and the superscript \(x\) denotes iteration \(x\)-times
of $F^\alpha (\text{i.e., if } F: \omega \to \omega \text{ then } F^0(x) = x, F^{m+1}(x) = F(F^m(x)))$.

Moreover, we introduce an auxiliary fast-growing hierarchy

\{F'_\alpha \}_\alpha \in \Omega \text{ as follows:}

- $F'_0(x) = x+1$,
- $F'_{\alpha+1}(x) = F'^x(F'_\alpha(x))$,
- $F'_\lambda(x) = F'_{\lambda[z]}(x)$, where $z = F'_{\lambda[1]}(x)$.

Then we have the following proposition which state that these hierarchies indexed by (p)-built-up ordinals have elementary properties on increase and domination.

**PROPOSITION 1.5.** For some $p < \omega$, we assume $\alpha \in \Omega^{(p)}$-bu. Then the following holds:

1. $F^\alpha(x) < F'_\alpha(x+1)$, $G^\alpha(x) \leq G'_\alpha(x+1)$ and $F'_\alpha(x) < F'^\alpha(x+1)$ for $p \leq x+1$.

2. If $\beta <_m \alpha$ for $p \leq m$, then $F^\beta(x) < F^\alpha(x)$, $G^\beta(x) < G^\alpha(x)$ and $F'_\beta(x) < F'_\alpha(x)$ for $x > m$.

**Proof.** By induction on $\alpha$. See Theorem 3.1 of [11].

1D. SUBRECURSIVE INACCESSIBILITY. Now let us define the subrecursive inaccessibility on these hierarchies:

**DEFINITION 1.6.** Let $p < \omega$. We call $\alpha \in \Omega^{(p)}$-bu subrecursive inaccessible (or s-inaccessible for short) if for all $x > p$,

$$G^\alpha(x) < F^\alpha(x) \leq F'^\alpha(x) \leq G'_\alpha(G^\alpha(x)).$$

This definition slightly differs from the original subrecur-
sive inaccessibility in [15],[16], but they have the same meaning which the slow-growing function at \( \alpha \) catches up with the fast-growing one.

**Lemma 1.7.** Let \( p < \omega \) and \( \alpha \in \Omega^{(p)}-bu \).

1. For all \( x > p \), \( G^\alpha(x) < F^\alpha(x) \leq F'_\alpha(x) \).
2. If \( \alpha \) is \( s \)-inaccessible, then \( \alpha \) is limit and \( G^2_\alpha \) dominates every \( F'_\beta \) with \( \beta < \alpha \) (i.e., for all but finitely many \( x \), \( F'_\beta(x) < G^\alpha(G^\alpha(x)) \)).

**Proof.** (1) Induction on \( \alpha \). (2) Clearly \( \alpha \) cannot be 0. For any \( \beta + 1 \in \Omega^{(p)}-bu \) and \( x > p \),

\[
G^\beta_{\beta+1}(x) = G^\beta(x) + 1 < F'_\beta(x) + 1 \leq F'_\beta(F'_\beta(x)) < F'_\beta(F'_\beta(x)) < F'_\beta(x+1) < F'_\beta(x) = F'_{\beta+1}(x). 
\]

Hence \( \alpha \) must be limit. On the other hand, we can prove that if \( \beta < \alpha \), then there is an \( m < \omega \) such that \( \beta <^m \alpha \) since \( \alpha \) is \((p)\)-built-up. Hence, \( F^\alpha \) dominates every \( F'_\beta \) with \( \beta < \alpha \). Therefore \( G^2_\alpha \) dominates every \( F'_\beta \) with \( \beta < \alpha \).

**Proposition 1.8 ([16,p.215]).** Let \( p < \omega \) and \( \alpha \in \Omega^{(p)}-bu \) satisfy that

\[ G^\alpha_{\alpha(n+1)} = F'_\alpha[\alpha(n)] \text{ for all } n < \omega. \]

Then \( \alpha \) is \( s \)-inaccessible and, if \( \alpha[0] \) is finite (i.e., \( \alpha[0] = 0+1+\cdots+1 \)), then no \( \beta < \alpha \) is \( s \)-inaccessible.

**Proof.** If \( G^\alpha_{\alpha(n+1)} = F'_\alpha[\alpha(n)] \) for each \( n \) and \( z = F^\alpha_{\alpha(1)}(x) \), then

\[ z = F^\alpha_{\alpha(1)}(x) = G^\alpha_{\alpha(2)}(x) < G^\alpha[x](x) = G^\alpha(x) \]

for \( x > \max(2,p) \). Hence we have that
\[ F'_\alpha(x) = F'_\alpha(z)(x) = G_\alpha[z+1](x) \leq G_\alpha[G_\alpha(x)](x) \]
\[ \leq G_\alpha[G_\alpha(x)](G_\alpha(x)) = G_\alpha[G_\alpha(x)] = G_\alpha^2(x). \]

(Since \( \alpha \) is limit and \((p)\)-built-up, we have \( G_\alpha(x) \geq x \ (x > p) \).)

So \( \alpha \) is s-inaccessible. If also \( \alpha[0] \) is finite and \( \beta < \alpha \) were s-inaccessible then \( \alpha[0] < \beta \) since \( \beta \) is limit. So \( \alpha[n] < \beta \leq \alpha[n+1] \) for some \( n \). By 1.7, for sufficiently large \( x \),
\[ G_{\alpha[n+1]}^2(x) = F_{\alpha[n]}(x) \leq F_{\alpha[n]+1}(x) = F_{\alpha[n]+1}(x) < G_{\beta}^2(x) \]

since \( \alpha[n]+1 < \beta \). This is a contradiction, since \( \beta < \alpha[n+1] \) and therefore \( G_{\beta}^2(x) \leq G_{\alpha[n+1]}^2(x) \) for sufficiently large \( x \). □

This proposition suggests a method for constructing a minimal s-inaccessible which we shall denote
\[ \tau' = (\tau'[x])_{x < \omega}. \]

First choose \( \tau' = 3 \) for which \( F_3 \) dominates all functions elementary in \( \{F_\beta : \beta < 3\} \). Then if \( \tau'[0], \ldots, \tau'[n] \) have already defined, choose \( \tau'[n+1] \) so that \( G_{\tau'[n+1]} = F_{\tau'[n]}. \)

**1E. A MINIMAL S-INACCESSIBLE \( \tau' \).** We introduce a minimal s-inaccessible \( \tau' \) as in [15],[16]. Just as the fast-growing hierarchy uses countable tree-ordinals \( \alpha \) to name big number-theoretic functions \( F'_\alpha \), we can use uncountable tree ordinals \( \alpha \) to name big ordinal-functions \( \varphi(\alpha) : \Omega \rightarrow \Omega \). These can be used to name bigger number-theoretic functions \( F'_{\varphi(\alpha)(\beta)} \) etc. This idea leads to a collection of higher level fast-growing hierarchies \( \varphi_n(\alpha) : \Omega_n \rightarrow \Omega_n \) where \( \alpha \) ranges over the next higher tree class \( \Omega_{n+1} \).

**DEFINITION 1.9 ([15]).** The sets \( \Omega_n \) of higher level tree-
ordinals are defined by induction similarly to the case of $\Omega$:

(i) $0 \in \Omega_n$.

(ii) If $\alpha \in \Omega_n$, then $\alpha+1 \in \Omega_n$.

(iii) If $\alpha \in \Omega_n$, then $(\alpha \gamma)_{\gamma \in \Omega_k} \in \Omega_n$.

As in the case of $\Omega$, we call $(\alpha \gamma)_{\gamma \in \Omega_k}$ limit and write $\alpha[\gamma]$ instead of $\alpha \gamma$. We shall identify $\Omega_0$ with $\omega$, and $\Omega_1$ with $\Omega$, in the following.

DEFINITION 1.10 ([15, Definition 5]). The level $n$ fast-growing hierarchies of functions $\varphi_n: \Omega_{n+1} \times \Omega_n \rightarrow \Omega_n$ is defined by:

(i) $\varphi_n(0, \beta) = \beta+1$.

(ii) $\varphi_n(\alpha+1, \beta) = \varphi_n(\beta, \varphi_n(\alpha, \beta))$.

(iii) $\varphi_n(\lambda, \beta) = (\varphi_n(\lambda[\gamma], \beta))_{\gamma \in \Omega_k}$ for $\lambda = (\lambda[\gamma])_{\gamma \in \Omega_k}$ (k<n).

(iv) $\varphi_n(\lambda, \beta) = \varphi_n(\lambda[z], \beta)$, $z = \varphi_n(\lambda[1], \beta)$ for $\lambda = (\lambda[\gamma])_{\gamma \in \Omega_n}$

where $\varphi_n^\beta$ denotes the iteration $\beta$-times of $\varphi_n$ (i.e., if $\psi: \Omega_{n+1} \times \Omega_n \rightarrow \Omega_n$, then $\psi^0(\alpha, \beta) = \beta$, $\psi^{\beta+1}(\alpha, \beta) = \psi(\alpha, \psi^\beta(\alpha, \beta))$, $\psi^\lambda(\alpha, \beta) = (\psi^{\lambda[\gamma]}(\alpha, \beta))_{\gamma \in \Omega_m}$ for $\lambda = (\lambda[\gamma])_{\gamma \in \Omega_m}$.

Note that, in the case $n = 0$, $\varphi_0(\alpha, \beta) = F_\alpha(\beta)$ for $\alpha \in \Omega_1$ and $\beta \in \Omega_0(= \omega)$. We define $\omega_k \in \Omega_n$ by $\omega_k = (\gamma)_{\gamma \in \Omega_k}$ (i.e., $\omega_k[\gamma] = \gamma$).

DEFINITION 1.11 ([15, Definition 7]). The sets $T_n$ ($\subset \Omega_n$) of named tree-ordinals are defined inductively by:

(i) $0, 1, \omega_0, \ldots, \omega_{n-1} \in T_n$. 

(ii) \( T_k \subseteq T_n \) for \( k < n \).

(iii) If \( \alpha \in T_{n+1} \) and \( \beta, \gamma \in T_n \), then \( \varphi_n^\gamma(\alpha, \beta) \in T_n \).

THEOREM 1.12 (Collapsing theorem [15]). Let \( x < \omega, \alpha \in T_2 \) and \( \beta \in T_1 \). Then

\[
G_{\varphi_1(\alpha, \beta)}(x) = F'_{c\alpha}(G_\beta(x)),
\]

where the function \( c (= c_x) \) which collapses each \( T_{n+1} \) to \( T_n \) is defined by: \( c_0 = 0, \ c_1 = 1, \ c_\omega = x, \ c_{\omega_{k+1}} = \omega_k \).

\( c(\varphi_{k+1}^\gamma(\delta, \xi)) = \varphi_k^{c\gamma}(c\delta, c\xi), \ c(\varphi_0^\gamma(\delta, \xi)) = \varphi_0^\gamma(\delta, \xi). \) Hence, in particular, if \( \alpha \) is generated in \( T_2 \) without reference to \( \omega_0 \) then, as \( G_{\omega_0}(x) = x \), we have \( G_{\varphi_1(\alpha, \omega_0)} = F'_{c\alpha} \).

We shall prove this theorem in Section 3 by using the strong normalization theorem in Section 2. Together with Proposition 1.8, we can construct a minimal \( s \)-inaccessible ordinal as follows:

DEFINITION 1.13 ([15, Example 4]). We define \( \tau' = (\tau'[x])_{x<\omega} \) by setting \( \tau'[0] = 3, \)

\[
\tau'[n+1] = \varphi_1(\cdots \varphi_n(\varphi_{n+1}(3, \omega_n), \omega_{n-1}), \cdots, \omega_0).
\]

THEOREM 1.14. \( \tau' \) is a minimal \( s \)-inaccessible tree-ordinal.

Proof. From Section 4, \( \tau' \) is \( (3) \)-built-up. Hence 1.8 and the collapsing theorem (1.12) complete the proof. \( \square \)
§2. PROVABLE COMPUTABILITY OF $F_{\alpha}(\alpha < \tau')$

2A. In this section, we shall prove Theorem 2.10:

(II) for $\alpha < \tau'$, $F_{\alpha}$ and $F'_{\alpha}$ are provably computable in $ID_{<\omega}$.

(For the definition of $ID_{<\omega}$, see Section 5.) As the corollaries of this proof, we shall prove also that the collapsing theorem in Section 3, and (3)-built-upness of $\tau'$ in Section 4 which we had used to prove (I) in Section 1.

To prove (II) above, we shall introduce the term structures for the sets $T_n$ ($n<\omega$). Then we shall prove the strong normalization theorem for the structures. Our method here is the same as that of [4, Section 2] and our results of this section (and of Sections 3, 4 below) comes from those of [10].

2B. THE TERM STRUCTURES. We introduce term structures $\bar{T}_n, NT_n, \cdot, \cdot, \cdots$ ($n<\omega$) by considering each element in $T_n$ as a finitary term and each defining equation of $\varphi_n$ (Definition 1.10) as a rewrite (or reduction) rule of the terms. Let $\bar{0}, \bar{1}, \bar{\omega}_0, \bar{\omega}_1, \ldots; \bar{\varphi}_0, \bar{\varphi}_1, \ldots$ be formal symbols.

DEFINITION 2.1. The sets $\bar{T}_n$ of terms are defined inductively by:

(i) $\bar{0}, \bar{1}, \bar{\omega}_0, \bar{\omega}_1, \ldots, \bar{\omega}_{n-1} \in \bar{T}_n$.

(ii) $\bar{T}_k \subseteq \bar{T}_n$ for $k < n$.

(iii) If $a \in \bar{T}_{n+1}$ and $b, c \in \bar{T}_n$, then $\bar{\varphi}_n^c(a,b) \in \bar{T}_n$.

Naturally, terms in $\bar{T}_n$ are interpreted as tree-ordinals by
the function ord: \( \bar{T}_n \rightarrow T_n \) such that (1) \( \text{ord}(\bar{0}) = 0 \), \( \text{ord}(\bar{1}) = 1 \), \( \text{ord}(\bar{\omega}_k) = \omega_k \), (11) \( \text{ord}(\bar{\varphi}_n^c(a,b)) = \varphi_n^{\text{ord}(c)}(\text{ord}(a),\text{ord}(b)) \).

**Abbreviations.** \( \bar{\varphi}_n(a,b) = \bar{\varphi}_n^1(a,b), \ b+1 = \bar{\varphi}_n(\bar{0},b) \).

**DEFINITION 2.2 (Normal terms).** The sets \( NT_n \) of **normal terms** in \( \bar{T}_n \): \( \text{dom}(a) \in \{ \emptyset, \bar{0}, \bar{T}_0, \ldots, \bar{T}_{n-1} \} \) and \( a[s] \) for \( a \in NT_n \), \( s \in \text{dom}(a) \) are defined inductively by:

(N1) \( \bar{0} \in NT_n \); \( \text{dom}(\bar{0}) = \emptyset \).
(N2) \( \bar{1} \in NT_n \); \( \text{dom}(\bar{1}) = \{ \bar{0} \} \), \( \bar{1}[\bar{0}] = \bar{0} \).
(N3) \( \bar{\omega}_1 \in NT_n \) (\( 1 < n \)); \( \text{dom}(\bar{\omega}_1) = \bar{T}_1 \), \( \bar{\omega}_1[s] = s \).
(N4) \( NT_k \subset NT_n \) for \( k < n \).
(N5) Let \( a \in NT_{n+1} \), \( b,c \in NT_n \) and \( A = \bar{\varphi}_n^c(a,b) \). Then \( A \in NT_n \) if one of the following holds:

(i) \( c = \bar{1} \) and \( a = \bar{0} \) (i.e., \( A = b+1 \)); \( \text{dom}(A) = \{ \bar{0} \} \), \( A[s] = b \).
(ii) \( \text{dom}(c) = \bar{T}_k (k < n) \); \( \text{dom}(A) := \text{dom}(c) \), \( A[s] = \bar{\varphi}_n^c[s](a,b) \).
(iii) \( c = \bar{1} \) and \( \text{dom}(a) = \bar{T}_k (k < n) \); \( \text{dom}(A) = \text{dom}(a) \),

\[ A[s] = \bar{\varphi}_n(a[s],b) \].

Next we introduce a **term-rewriting system** \( S \) (see e.g., Dershowitz[7] as for the definition) so that, for every term in \( \bar{T}_n \) which is not normal, some rewrite rule in \( S \) is applicable to it.

**Definition of the rewrite rules of \( S \):** For normal \( a,b,c \):

(R1) \( \bar{\varphi}_n(\bar{0},a) \rightarrow b \), \hspace{1cm} (R2) \( \bar{\varphi}_n(\bar{1},b) \rightarrow \bar{\varphi}_n^b(\bar{0},\bar{\varphi}_n(\bar{0},b)) \).

(R3) \( \bar{\varphi}_n(a+1,b) \rightarrow \bar{\varphi}_n^b(a,\bar{\varphi}_n(a,b)) \),
(R4) \( \tilde{\varphi}_n^{C+1}(a,b) \rightarrow \tilde{\varphi}_n(a,\tilde{\varphi}_n^C(a,b)) \).

(R5) \( \tilde{\varphi}_n(a,b) \rightarrow \tilde{\varphi}_n(a[z],b) \) with \( z = \varphi_n(a[1],b) \)
if \( \text{dom}(a) = \tilde{T}_n \).

Every rule in (R1)-(R5) may be applied to a term \( A \in \tilde{T}_n \) if \( A \) contains a subterm of the left-hand side of the rule. Then the rule is used by replacing the subterm to the right-hand side of the rule. We write \( A \xrightarrow{1} B \) to indicate that the term \( B \) is obtained from the term \( A \) by a single application of some rule. We have the following fundamental proposition.

**Proposition 2.3.** (1) For every \( a \in \tilde{T}_n \), \( a \in NT_n \) if and only if there is no \( b \in \tilde{T}_n \) such that \( a \xrightarrow{1} b \).

(2) (i) If \( a \in NT_n \) and \( a = b+1 \) for some \( b \), then \( \text{ord}(a) = \text{ord}(b)+1 \).

(ii) If \( a \in NT_n \) and \( \text{dom}(a) = \tilde{T}_k \) (\( k < n \)), then \( \text{ord}(a) = (\text{ord}(a)[\gamma])_{\gamma \in \Omega_k} \) and \( \text{ord}(a[b]) = \text{ord}(a)[\text{ord}(b)] \) for \( a \in \tilde{T}_k \).

(iii) If \( a \in \tilde{T}_n \) and \( a \xrightarrow{1} b \), then \( \text{ord}(a) = \text{ord}(b) \).

**Proof.** Induction on the length of \( a \).

**2C. THE STRONG NORMALIZATION THEOREM.** Now we say that a term \( A \in \tilde{T}_n \) is strongly normalizable if every derivation sequence starting at \( A \) (i.e., \( A \xrightarrow{1} A' \xrightarrow{1} A'' \xrightarrow{1} \cdots \) ) is finite (cf.[9]). Then we prove the following theorem:

**Theorem 2.4 (Strong normalization theorem[10, Theorem 1]).**

Every term \( a \) in \( \tilde{T}_n \) is strongly normalizable.
We can also show that the term rewriting system (S) has the Church-Rosser property (i.e., if $A \Rightarrow B$ and $A \Rightarrow C$, then there is a $D$ such that $B \Rightarrow D$ and $C \Rightarrow D$, where $a \Rightarrow b$ indicates that $b$ is obtained from $a$ by a finite (perhaps empty) series of reduction $\overset{1}{\Rightarrow}$). This can be shown by induction on the length of terms $A$. However, we do not need this property in the article.

We devote the rest of this section to prove the strong normalization theorem and, as a corollary, prove Theorem 2.10. First, we introduce the subsets $W_n$ of $\tilde{T}_n$ which express all strongly normalizable terms of $\tilde{T}_n$. Then we prove that $\tilde{T}_n = W_n$ in $\text{ID}_{<\omega}$.

**DEFINITION 2.5.** For $n < \omega$, the sets $W_n$ ($c \tilde{T}_n$) are defined inductively by:

(W1) $\overline{0} \in W_n$.

(W2) If $a \in \tilde{T}_n$ is normal and $a(s) \in W_n$ for all $s \in \text{dom}(a)$, then $a \in W_n$.

(W3) If $a \in \tilde{T}_n$ is not normal and $b \in W_n$ for all $b$ such that $a \overset{1}{\Rightarrow} b$, then $a \in W_n$.

We can easily show that every term in $W_n$ is strongly normalizable as follows. From the inductive definition of $W_n$, the following partial ordering $\ll$ on $\bigcup_{n<\omega} W_n$ is well-founded: $\ll$ is defined as the transitive closure of

(i) $\overline{0} \ll a$,

(ii) $a(s) \ll a$ where $a$ is normal and $s \in \text{dom}(a)$,

(iii) $b \ll a$ where $a$ is not normal and $a \overset{1}{\Rightarrow} b$.

Hence, if $A \in W_n$, there is no infinite sequence $\langle A_i \rangle_{i<\omega}$ such
that \( A = A_0, A_{i+1} \ll A_i \). Thus, in particular, every term in \( W_n \) is strongly normalizable.

We remark here that, as usual, we can extend \( \ll \) to the lexicographic orderings \( \ll \) on \( W_{n+1} \times W_n \) and \( W_{n+1} \times W_n \times W_n \) which are also well-founded. To prove the strong normalization theorem, we show the following theorem.

**Theorem 2.6.** For each \( a \in \tilde{T}_n \), "\( a \in W_n \) is provable in ID\( _{<\omega} \)."

**Lemma 2.7.** (ID\( _{<\omega} \)) Let \( a \in W_{n+1} \) and \( b, c \in W_n \). If \( \varphi_n(a, d) \in W_n \) for all \( d \in W_n \), then \( \varphi_n^c(a, b) \in W_n \).

**Proof.** By induction on \( (a, b, c) \in W_{n+1} \times W_n \times W_n \) over \( \ll \). Let \( A = \varphi_n^c(a, b) \). We have the following cases:

Case 1. \( A \in NT_n \) and \( \text{dom}(A) = \{0\} \): Then \( A = \varphi_n(0, b) \). By the assumption, \( A \in W_n \).

Case 2. \( A \in NT_n \) and \( \text{dom}(A) = \tilde{T}_k(\leq n) \): Let \( s \in \tilde{T}_k \).

(i) \( \text{dom}(c) = \tilde{T}_k \): Then \( c[s] \ll c \). By I.H. (= induction hypotheses), \( A[s] = \varphi_n^{c[s]}(a, b) \in W_n \).

(ii) \( c = 1 \) and \( \text{dom}(a) = \tilde{T}_k \): By the assumption, \( A \in W_n \). Hence \( A[s] \in W_n \) by (W2). Hence, \( A \in W_n \) by (W2).

Case 3. \( A \in \tilde{T}_n \setminus NT_n \): Let \( A \rightarrow B \). We will show \( B \in W_n \).

(i) \( A = \varphi_n(0, a, b) \) and \( B = b \): Then \( B \in W_n \).

(ii) \( A = \varphi_n(a, b) \): Since \( A \in W_n \) by the assumption, \( B \in W_n \) by (W3).

(iii) \( A = \varphi_n^{e+1}(a, b) \) and \( B = \varphi_n(a, \varphi_n^e(a, b)) \): From \( e \ll e+1 \) and I.H., \( \varphi_n^e(a, b) \in W_n \). Hence \( B \in W_n \) by the assumption.

(iv) In all other cases (e.g., \( A = \varphi_n^c(a, b) \), \( B = \varphi_n^c(a', b) \) and...
a \overset{1}{\rightarrow} a' \), \( b \in W_n \) follows immediately from I.H. Hence \( A \in W_n \) by (W3).

**LEMMA 2.8. (ID\( _{<\omega} \))** For \( a \in W_{n+1} \) and \( b \in W_n \), \( \bar{\phi}_n(a,b) \in W_n \).

**Proof.** By induction on \((a,b) \in W_{n+1} \times W_n\) over \(<<\). Let \( A = \bar{\phi}_n(a,b) \).

Case 1. \( A \in NT_n \) and \( \text{dom}(A) = \{\bar{0}\} \): Then \( A = \bar{\phi}_n(\bar{0},b) \) and \( A[\bar{0}] = b \in W_n \). Hence \( A \in W_n \) by (W2).

Case 2. \( A \in NT_n \) and \( \text{dom}(A) = \bar{T}_n(k<n) \): Then \( \text{dom}(a) = \bar{T}_n \) and \( A[s] = \bar{\phi}_n(a[s],b) \) for \( s \in \text{dom}(A) \). From \( a[s] << a \) and I.H., \( A[s] \in W_n \). Hence \( A \in W_n \) by (W2).

Case 3. \( A \in \bar{T}_n \setminus NT_n \): Let \( A \overset{1}{\rightarrow} B \). We will show \( B \in W_n \).

1. \( A = \bar{\phi}_n(a'+b,1,b) \) and \( B = \bar{\phi}_n(b',\bar{\phi}_n(a',b)) \): By I.H., \( \bar{\phi}_n(a',d) \in W_n \) for all \( d \in W_n \). Hence, \( \bar{\phi}_n(a',b) \in W_n \) and \( B \in W_n \) by 2.7.

2. \( A = \bar{\phi}_n(a,b) \) and \( B = \bar{\phi}_n(a[z],b) \) where \( a \in NT_{n+1}, \text{dom}(a) = \bar{T}_n \). \( z = \bar{\phi}_n(a[1],b) \): Since \( a \in W_{n+1}, b \in W_n \) and \( 1 \in W_n \), we have \( a[1] \in W_{n+1} \) by (W2). So \( z \in W_n \) from I.H. and \( a[1] << a \). Hence \( a[z] \in W_{n+1} \) by (W2). Therefore \( B \in W_n \) from \( a[z] << a \) and I.H.

3. In all other cases (e.g., \( A = \bar{\phi}_n(a,b), B = \bar{\phi}_n(a',b) \) and \( a \overset{1}{\rightarrow} a' \), \( B \in W_n \) follows immediately from I.H. Hence \( A \in W_n \) by (W3).

**LEMMA 2.9. (ID\( _{<\omega} \))** For \( a \in W_{n+1} \) and \( b,c \in W_n \), \( \bar{\phi}_n^c(a,b) \in W_n \).

**Proof.** Immediate from 2.7 and 2.8.

**Proof of Theorem 2.6.** By induction on the length of \( a \in T_n \).
Clearly, $\bar{0}$, $\bar{1}$, $\bar{0}_0, \ldots, \bar{0}_{n-1} \in W_n$ and $W_k \subset W_n$ for $k < n$. By 2.9, $\bar{0}_n^C(d, b) \in W_n$ for $d \in W_{n+1}$ and $b, c \in W_n$. This completes the proof. $\Box$

Proof of Theorem 2.4 (Strong normalization theorem). From 2.6, we have $T_n = W_n$. Hence, if we consider the well-founded ordering $<<$ on $W_n$ defined above, it is also the well-founded ordering on $T_n$. If there were an infinite sequence $\{a_i\}_{i<\omega}$ such that $a_0 \overset{\alpha}{\rightarrow} a_1 \overset{\alpha}{\rightarrow} a_2 \overset{\alpha}{\rightarrow} \cdots$, then it is an infinite descending sequence on $<<$ such that $\cdots << a_2 << a_1 << a_0$. This contradicts the well-foundedness of $<<$ on $T_n$. Hence the proof of the strong normalization theorem is completed. $\Box$

Theorem 2.10. For each $\alpha < \tau'$, $F_\alpha$ and $F'_\alpha$ are provably computable in $ID_{<\omega}$.

Proof. Let $\alpha < \tau'$. Then $\alpha < \tau'[m] \in T_1$ for some $m < \omega$. Hence $\alpha \in T_1$ and there is an $a \in T_1$ such that $\alpha = \text{ord}(a)$. From 2.9, $\forall x(\bar{0}_0(a, x) \in W_0)$ is provable in $ID_{<\omega}$ where $\bar{x}$ is the numeral of $x$ (i.e., if $x = 0$, then $\bar{x} = \bar{0}$; if $x = 1$ then $\bar{x} = \bar{1}$; if $x > 1$ then $\bar{x} = \bar{0}(0, \bar{x} - 1)$). Hence $\forall x \exists y(\bar{0}_0(a, x) \overset{\alpha}{\rightarrow} \cdots \overset{\alpha}{\rightarrow} \bar{y})$ is provable in $ID_{<\omega}$. On the other hand, $\text{ord}(\bar{0}_0(a, x)) = F'_\alpha(x)$ and $\text{ord}(\bar{y}) = y$. And we have that if $b \overset{\alpha}{\rightarrow} d$ then $\text{ord}(b) = \text{ord}(d)$. Hence $\forall x \exists y(\bar{0}_0(a, x) \overset{\alpha}{\rightarrow} \cdots \overset{\alpha}{\rightarrow} \bar{y})$ equals to $\forall x \exists y(F'_\alpha(x) = y)$. Therefore $F'_\alpha$ is provably computable in $ID_{<\omega}$. Moreover, we have $F_\alpha(x) \leq F'_\alpha(x)$. Hence $\forall x \exists y(F'_\alpha(x) = y)$ implies $\forall x \exists y(F_\alpha(x) = y)$ in $ID_{<\omega}$. Therefore $F_\alpha$ is also provably computable in $ID_{<\omega}$. $\Box$
§3. COLLAPSING THEOREM

3A. As a corollary of the strong normalization theorem proved above, we shall prove the collapsing theorem (Theorem 1.12) used in Section 1:

THEOREM 1.12 (Collapsing Theorem [15]). Let $x < \omega, \alpha \in T_2$ and $\beta \in T_1$. Then

$$G_{\varphi_1}(\alpha, \beta)(x) = F'_{\alpha \beta}(G_{\beta}(x)),$$

where the function $\sigma$ ($= \sigma_{\chi}$) which collapses each $T_{n+1}$ to $T_n$ is defined by: $\sigma_0 = 0$, $\sigma_1 = 1$, $\sigma_0 = x$, $\sigma_{k+1} = \omega_k$. $\sigma(\varphi_{k+1})(\delta, \xi) = \varphi_k(\delta, \xi)$, $\sigma(\varphi_0)(\delta, \xi) = \varphi_0(\delta, \xi)$. Hence, in particular, if $\alpha$ is generated in $T_2$ without reference to $\omega_0$ then, as $G_{\omega_0}(x) = x$, we have $G_{\varphi_1}(\alpha, \omega_0) = F'_{\alpha \beta}$.

We introduce a function $\tilde{\sigma}$ which represents the function $\sigma$ on the terms as follows: (for each fixed $x < \omega$) (1) $\tilde{\sigma} \sigma = \sigma \bar{0}$, $\tilde{\sigma} \bar{1} = \bar{1}$, $\tilde{\sigma} \sigma_0 = \bar{x}$, $\tilde{\sigma} \sigma_{k+1} = \sigma_k$. (2) $\tilde{\sigma}(\tilde{\varphi}_{n+1})(\delta, \xi) = \tilde{\varphi}_n(\sigma_0(\delta), \sigma_0(\xi))$ and $\tilde{\sigma}(\tilde{\varphi}_0)(\delta, \xi) = \tilde{\varphi}_0(\sigma_0(\delta), \sigma_0(\xi))$.

LEMMA 3.1. Let $a \in \tilde{T}_n$ and $x < \omega$. Then the following hold.

(1) If $a = b+1$ for some $b$, then $\tilde{\sigma}(b) = \sigma b+1$.

(2) If $a \in \text{NT}_n$ and $\text{dom}(a) = \tilde{T}_0$, then $\tilde{\sigma}(a[\bar{x}]) = \sigma a$ and $\text{ord}(a[\bar{x}]) = \text{ord}(a)$.

(3) If $a \in \text{NT}_n$ and $\text{dom}(a) = \tilde{T}_k$ for some $k > 0$, then
ord(a[b]) = ord(a)[ord(b)] and
ord(\hat{c}(a[b])) = ord(\hat{c}a)[ord(\hat{c}b)] for b \in \text{dom}(a).

(4) If a \xrightarrow{1} b, then ord(a) = ord(b) and ord(\hat{c}a) = ord(\hat{c}b).

Proof. (1)-(4) Induction on the length of a. □

**Lemma 3.2.** If x < \omega and a \in \hat{T}_1, then \text{G}_{\text{ord}(a)}(x) = ord(\hat{c}a).

**Proof.** From the strong normalization theorem (Theorem 2.4), the proof is proceeded by transfinite induction on a over the well-founded ordering \ll (where \ll on \hat{T}_n is defined as the transitive closure of (i) \hat{0} \ll b, (ii) b[z] \ll b for normal b with z \in \text{dom}(b), (iii) d \ll b for non-normal b with b \xrightarrow{1} d).

Case 1. a = \hat{0}. This case is trivial.

Case 2. a \in NT_1 and \text{dom}(a) = \{\hat{0}\}. Then a = \hat{1} or b+1 for some b \in \hat{T}_1. If a = \hat{1}, the assertion is trivial. If a = b+1, then
\[ \text{G}_{\text{ord}(a)}(x) = \text{G}_{\text{ord}(b)}(x+1) = \text{ord}(\hat{c}b)+1 = \text{ord}(\hat{c}a) \]
by I.H. and 3.1(1).

Case 3. a \in NT_1 and \text{dom}(a) = \hat{T}_0. By 3.1(2) and I.H.,
\[ \text{G}_{\text{ord}(a)}(x) = \text{G}_{\text{ord}(a[\hat{x}])}(x) = \text{ord}(\hat{c}(a[\hat{x}]))) = \text{ord}(\hat{c}a). \]
Case 4. a \xrightarrow{1} b for some b. By 3.1(4) and I.H.,
\[ \text{G}_{\text{ord}(a)}(x) = \text{G}_{\text{ord}(b)}(x) = \text{ord}(\hat{c}b) = \text{ord}(\hat{c}a). \] □

**Proof of the collapsing theorem (Theorem 1.12).** For a \in \hat{T}_2 and b \in \hat{T}_1, we have \hat{c}(\phi_1(a,b)) = \phi_0(\hat{c}a,\hat{c}b) and hence ord(\hat{c}(\phi_1(a,b))) = \phi_0(\text{ord}(\hat{c}a),\text{ord}(\hat{c}b))). Thus we have
\[ \text{G}_{\phi_1(\text{ord}(a),\text{ord}(b))}(x) = \text{G}_{\phi_1(a,b)}(x) = \text{ord}(\hat{c}(\phi_1(a,b))) \]
by 3.2.
For given \( \alpha \in T_2 \) and \( \beta \in T_1 \), we choose \( a \) and \( b \) above such that

1. \( \text{ord}(a) = \alpha \), \( \text{ord}(\bar{a}a) = \alpha \alpha \) and
2. \( \text{ord}(b) = \beta \) (we can choose such \( a \) and \( b \) since the elements of \( T_n \) are constructed by the same way as to the element in \( T_n \)). This completes the proof. \( \square \)

We recall that (Definition 1.13);

\[
\tau'[0] = 3, \quad \tau'[n+1] = \varphi_1(...\varphi_n(\varphi_{n+1}(3, \omega_n), \omega_{n-1}), ..., \omega_0).
\]

We have the following figure from the collapsing theorem and Proposition 1.8:

\[
\begin{align*}
\tau'[0] &= 3, & G_{\tau'[0]}(x) &= 3 \\
\tau'[1] &= \varphi_1(3, \omega_0), & G_{\tau'[1]}(x) &= F_{\tau'[0]}(x) \\
\tau'[2] &= \varphi_1(\varphi_2(3, \omega_1), \omega_0), & G_{\tau'[2]}(x) &= F_{\tau'[1]}(x) \\
\tau'[3] &= \varphi_1(...), & G_{\tau'[3]}(x) &= F_{\tau'[2]}(x) \\
& \vdots & & \vdots
\end{align*}
\]

\[
\tau' = (\tau'[x])_{x<\omega} \quad \therefore \quad G_{\tau'}(x) < F_{\tau'}(x) \leq F'_{\tau'}(x) \leq G^2_{\tau'}(x) \quad (x > p).
\]

(\( \tau' \) is minimal \( s \)-inaccessible)

Figure 3.1.
§4. (3)-BUILT-UPNESS OF $\tau'$

4A. In this section we shall prove the following theorems:

THEOREM 4.9. Every element in $T^+_1$ is $(k)$-built-up for all $k < \omega$.

THEOREM 4.10. $\tau'$ is (3)-built-up.

This corollary completes the proof of Theorem 1.14 that $\tau'$ is minimal $s$-inaccessible.

In this section, we shall also introduce the sets of $T^*_n$ ($\in T^*_n$ \ $\in T_n$) for the use of the next section. To begin with, we prove the following proposition which is needed to prove our theorems below.

PROPOSITION 4.1 ([10, Lemma 3.4]). Let $\alpha \in T_n$ and $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_m}$. Then $\alpha[\gamma] \in T_n$ for every $\gamma \in T_m$. Moreover, if $\gamma \in T_m \setminus \{0\}$, then $\alpha[\gamma] \in T_n \setminus \{0\}$.

Proof. For a given $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_m} \in T_n$, there is a normal $a \in T_n$ such that $\text{ord}(a) = \alpha$ by 2.3(2)(iii) and the strong normalization theorem. We fix such an $a \in T_n$ with the minimal length. The proof of this proposition can be proceeded by induction on the length of this term $a$ for $\alpha$. □
It follows from this proposition that we can use transfinite induction on the terms in $T_n$ ($n < \omega$) over the ordering $<$ of $T_n$ which is defined in the same way as $<$ in $\Omega$; i.e., $<$ is the transitive closure of

1. $0 \leq \alpha$,
2. $\alpha < \alpha + 1$,
3. $\alpha[\gamma] < \alpha$ for all $\gamma \in T_n$ if $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_n}$.

Next we extend the relation $<_k$ ($k < \omega$) on $\Omega$ to higher level tree-ordinals from this proposition.

**DEFINITION 4.2.** The step-down relations $<_k$ ($k < \omega$) on $\cup_{n < \omega} T_n$ are defined inductively as follows: For $\alpha, \beta \in T_n$,

$\alpha <_k \beta$ if $\beta \neq 0$ and one of the following holds:

1. $\alpha <_k \gamma$ if $\beta = \gamma + 1$,
2. $\alpha <_k \beta[k]$ if $\beta = (\beta[x])_{x \in \Omega_0}$,
3. $\alpha <_k \beta[\gamma]$ for all $\gamma \in T_n \setminus \{0\}$ if $\beta = (\beta[\gamma])_{\gamma \in \Omega_m}$ ($m > 0$).

where $\alpha <_k \delta$ means that $\alpha <_k \delta$ or $\alpha = \delta$.

Note that if $\alpha, \beta \in T_1$ then the relations $<_k$ defined above are the same as ones defined in Definition 1.2.

**LEMMA 4.3.** For $\alpha \in T_{n+1}$, $\beta \in T_n$ and $\gamma \in T_n \setminus \{0\}$, $\beta <_k \varphi_n^\gamma(\alpha, \beta)$.

*Proof.* The lemma immediately follows from the two claims. □

**CLAIM 1.** Let $\alpha \in T_{n+1}$ and $\beta \in T_n$. If $\delta <_k \varphi_n(\alpha, \delta)$ for all $\delta \in T_n$, then $\beta <_k \varphi_n^\gamma(\alpha, \beta)$ for $\gamma \in T_n \setminus \{0\}$.

*Proof of Claim 1.* Transfinite induction on $\gamma \in T_n$.

Case 1. $\gamma = n+1$. Then $\beta <_k \varphi_n^n(\alpha, \beta) <_k \varphi_n(\alpha, \varphi_n^n(\alpha, \beta)) = \varphi_n^\gamma(\alpha, \beta)$ by I.H.
Case 2. $\gamma = (\gamma[x])_{x \in \Omega_0}$. Then $\beta \leq_k \varphi_n^\gamma[\alpha, \beta] = \varphi_n^\gamma(\alpha, \beta)[k]$ by I.H. Hence $\beta <_k \varphi_n^\gamma(\alpha, \beta)$.

Case 3. $\gamma = (\gamma[\delta])_{\delta \in \Omega_m} (0 < m < n)$. From 4.1, $\gamma[\delta] \in T_n \setminus \{0\}$ for $\delta \in T_m \setminus \{0\}$. Hence $\beta <_k \varphi_n^\gamma[\alpha, \beta] = \varphi_n^\gamma(\alpha, \beta)[\delta]$ for $\delta \in T_m \setminus \{0\}$ by I.H. Therefore $\beta <_k \varphi_n^\gamma(\alpha, \beta)$.

CLAIM 2. Let $\alpha \in T_{n+1}$. Then $\beta <_k \varphi_n(\alpha, \beta)$ for all $\beta \in T_n$.

Proof of Claim 2. Transfinite induction on $\alpha \in T_{n+1}$.

Case 1. $\alpha = 0$. Then $\beta <_k \beta + 1 = \varphi_n(\alpha, \beta)$.

Case 2. $\alpha = \gamma + 1$. Then $\delta <_k \varphi_n(\gamma, \delta)$ for all $\delta \in T_n$ by I.H. Hence, by Claim 1, $\beta <_k \varphi_n(\gamma, \beta) <_k \varphi_n(\gamma, \varphi_n(\gamma, \beta)) = \varphi_n(\alpha, \beta)$.

Case 3. $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_m} (m < n)$. By I.H., $\beta <_k \varphi_n(\alpha[\gamma], \beta) = \varphi_n(\alpha, \beta)[\gamma]$ for $\gamma \in T_m$. Hence $\beta <_k \varphi_n(\alpha, \beta)$.

Case 4. $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_n}$. By I.H., $\beta <_k \varphi_n(\alpha[z], \beta) = \varphi_n(\alpha, \beta)$ where $z = \varphi_n(\alpha[1], \beta)$.

LEMMA 4.4. Let $\alpha \in T_{n+1}$ and $\beta, \delta, \gamma \in T_n$. If $\gamma <_k \delta$, then $\varphi_n^\gamma(\alpha, \beta) <_k \varphi_n^\delta(\alpha, \beta)$.

Proof. Transfinite induction on $\delta \in T_n$.

Case 1. $\delta = 0$. This case is trivial.

Case 2. $\delta = \eta + 1$. By I.H. and 4.3, $\varphi_n^\gamma(\alpha, \beta) <_k \varphi_n^\eta(\alpha, \beta) <_k \varphi_n(\alpha, \varphi_n^\eta(\alpha, \beta)) = \varphi_n^\delta(\alpha, \beta)$.

Case 3. $\delta = (\delta[x])_{x \in \Omega_0}$. By I.H., $\varphi_n^\gamma(\alpha, \beta) <_k \varphi_n^\delta[k](\alpha, \beta) = \varphi_\alpha^\delta(\alpha, \beta)[k]$. Hence $\varphi_n^\gamma(\alpha, \beta) <_k \varphi_n^\delta(\alpha, \beta)$.

Case 4. $\delta = (\delta[\xi])_{\xi \in \Omega_m} (0 < m < n)$. Then $\varphi_n^\gamma(\alpha, \beta) <_k \varphi_n^\delta[\xi](\alpha, \beta) = \varphi_n^\delta[\xi](\alpha, \beta)$.
\( \varphi_n^\delta(\alpha, \beta)[\xi] \) for \( \xi \in T_n \setminus \{0\} \) by I.H. Hence \( \varphi_n^\gamma(\alpha, \beta) \prec_k \varphi_n^\delta(\alpha, \beta) \). \( \Box \)

**Lemma 4.5.** Let \( \alpha, \gamma \in T_{n+1}, \beta \in T_n \setminus \{0\} \) and \( n > 0 \). If \( \gamma \prec_k \alpha \), then \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\alpha, \beta) \).

**Proof.** Transfinite induction on \( \alpha \in T_n \).

Case 1. \( \alpha = 0 \). This case is trivial.

Case 2. \( \alpha = \eta + 1 \). By I.H. and 4.3, \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\eta, \beta) \prec_k \varphi_n(\eta, \varphi_n(\eta, \beta)) = \varphi_n(\alpha, \beta) \) since \( \beta \neq 0 \).

Case 3. \( \alpha = (\alpha[x]) \centerdot (\xi \in \Omega_0^\beta) \). By I.H., \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\alpha[k], \beta) = \varphi_n(\alpha, \beta)[k] \). Hence \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\alpha, \beta) \).

Case 4. \( \alpha = (\alpha[\xi]) \centerdot (\xi \in \Omega_m) \). By I.H., \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\alpha[\xi], \beta) = \varphi_n(\alpha, \beta)[\xi] \) for \( \xi \in T_n \setminus \{0\} \). Hence \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\alpha, \beta) \).

Case 5. \( \alpha = (\alpha[\xi]) \centerdot (\xi \in \Omega_n) \). By I.H., \( \varphi_n(\gamma, \beta) \prec_k \varphi_n(\alpha[z], \beta) = \varphi_n(\alpha, \beta) \) for \( \beta \in T_n \setminus \{0\} \) where \( z = \varphi_n(\alpha[1], \beta) \). \( \Box \)

**4B. THE SUBSETS** \( T_n^+ \) **OF** \( T_n \setminus \{n^\omega\} \). We shall define the subset \( T_n^+ \) for each \( n < \omega \), and prove that every element of \( T_1^+ \) is built-up.

**Definition 4.6.** The subset \( T_n^+ \subseteq T_n \) are defined inductively as follows:

1. \( 0, 1, \omega_0, \omega_1, \ldots, \omega_{n-1} \in T_n^+ \).
2. \( T_k^+ \subseteq T_n^+ \) for \( k < n \).
3. If \( \alpha \in T_{n+1}^+, \gamma \in T_n^+ \) and \( \beta \in T_n \setminus \{0\} \), then \( \varphi_n^\gamma(\alpha, \beta) \in T_n^+ \).

Note that the definition of \( T_n^+ \) above differs from that of \( T_n \) only in the restriction on \( \beta \) in (iii).
PROPOSITION 4.7 (cf. 4.1). Let $\alpha \in T_n^+$ and $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_m}$. Then $\alpha[\gamma] \in T_n^+$ for every $\gamma \in T_n^+$. Moreover, if $\gamma \in T_n^+ \setminus \{0\}$, then $\alpha[\gamma] \in T_n^+ \setminus \{0\}$.

Proof. It is proceeded in the same way as 4.1. First, we introduce the subsets $T_n^+ \subseteq T_n^+$ of terms of $T_n^+$ as 2.1:

(i) $\bar{0}, \bar{1}, \bar{w}_0, \bar{w}_1, \ldots, \bar{w}_{n-1} \in T_n^+$.

(ii) $\overline{T_k} \not\subseteq T_n^+$ for $k < n$.

(iii) If $\alpha \in T_{n+1}^+$, $\gamma \in T_n^+$ and $\beta \in T_n^+ \setminus \{0\}$, then $\varphi_n^\gamma(\alpha, \beta) \in T_n^+$.

Then we can prove that for each $\alpha \in T_n^+$, there is a term $a \in T_n^+$ such that $\text{ord}(a) = \alpha$. And the strong normalization theorem on $T_n^+$ holds since if $a \xrightarrow{a'} a'$ and $a \in T_n^+$, then $a' \in T_n^+$. Hence we can prove this proposition in the same way as 4.1.

\[ \square \]

THEOREM 4.8 ([10, Theorem 3]). Let $\alpha \in T_n^+$ and $\alpha = (\alpha[\xi])_{\xi \in \Omega_m}$. If $\gamma, \delta \in T_m$ and $\gamma <_k \delta$, then $\alpha[\gamma] <_k \alpha[\delta]$.

Proof. From the proof of 4.7., for a given $\alpha \in T_n^+$, we can take a normal term $a \in T_n^+$ with the minimal length such that $\text{ord}(a) = \alpha$. The proof of this theorem is proceeded by induction on the length of this term $a$. We have the following cases:

Case 1. $a = \bar{w}_m$. Then $\alpha = \omega_m$. We have $\alpha[\gamma] = \gamma <_k \delta = \alpha[\delta]$.

Case 2. $a = \varphi_n(d, b)$ and $\text{dom}(d) = T_m^+$. Then $\alpha = \varphi_n(\lambda, \beta)$ so that $\lambda = (\lambda[\xi])_{\xi \in \Omega_m} = \text{ord}(d)$ and $\beta = \text{ord}(b) \in T_n^+ \setminus \{0\}$ from the definition of $T_n^+$ above and $a \in T_n^+$. Hence, by I.H. $\lambda[\gamma] <_k \lambda[\delta]$ and 4.5, $\varphi_n(\lambda, \beta)[\gamma] = \varphi_n(\lambda[\gamma], \beta) <_k \varphi_n(\lambda[\delta], \beta) = \varphi_n(\lambda, \beta)[\delta]$.

Case 3. $a = \varphi_n^e(d, b)$ and $\text{dom}(e) = T_m^+$. This case is treated similarly to Case 2, using 4.4.

\[ \square \]
THEOREM 4.9. Each $\alpha \in T^+_1$ is $(k)$-built-up for all $k < \omega$.

Proof. For each $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_m} \in T^+_n$ and $\gamma \in T^+_m$, $\alpha[\gamma] \in T^+_n$ from 4.7. Hence for each $\alpha \in T^+_1$ and limit $\lambda \leq \alpha$, we have $\lambda \in T^+_1$. Thus by 4.8, $\lambda[x] \prec_k \lambda[x+1]$ for all $k$, $x < \omega$ and limit $\lambda \leq \alpha \in T^+_1$. \hfill \Box

The reason why we introduce the set $T^+_n$ is that $(k)$-built-upness does not hold for some element in $T^+_1$ since, if we put $\alpha = \varphi_1(\omega_0,0)$, then $\alpha[x] = \varphi_1(x,0) = 1$ for all $x < \omega$.

THEOREM 4.10 ([10, Corollary 3.1]). $\tau'$ is $(3)$-built-up.

Proof. Let $x < \omega$. From the definition of $\tau'(1.13)$, $\tau'[x] \in T^+_1$. By 4.9, $\tau'[x]$ is $(3)$-built-up. Hence it is sufficient to prove that $\tau'[x] \prec_3 \tau'[x+1]$. For this, we have

\[
\begin{align*}
\tau'[x] & = \varphi_1(\ldots \varphi_x(3,\omega_{x-1})\ldots,\omega_0) \\
& \prec_3 \varphi_1(\ldots \varphi_x(\varphi_1(3,\omega_0),\omega_{x-1})\ldots,\omega_0) \\
& \prec_0 \varphi_1(\ldots \varphi_x(\varphi_1(z,\omega_0),\omega_{x-1})\ldots,\omega_0) \\
& \text{where } z = \varphi_2(\ldots \varphi_x(1,\omega_{x-1})\ldots,\omega_1) \\
& = \varphi_1(\ldots \varphi_x(\omega_1,\omega_{x-1})\ldots,\omega_0) \\
& \prec_0 \varphi_1(\ldots \varphi_x(\varphi_2(z',\omega_1),\omega_{x-1})\ldots,\omega_0) \\
& \text{where } z' = \varphi_2(\ldots \varphi_x(1,\omega_{x-1})\ldots,\omega_1) \\
& = \varphi_1(\ldots \varphi_x(\omega_2,\omega_{x-1})\ldots,\omega_0) \\
& \prec_0 \ldots \\
& = \varphi_1(\ldots \varphi_x(\omega_1,\omega_{x-1})\ldots,\omega_0) \\
& \prec_3 \varphi_1(\ldots \varphi_x(\varphi_{x+1}(3,\omega_x),\omega_{x-1})\ldots,\omega_0)
\end{align*}
\]
from $3 < _3 \omega_0$ and from 3.5, 3.3.

4C. THE SUBSETS $T_n^*$ OF $T_n^+(n<\omega)$. Here we shall introduce the sets $T_n^*$ of terms which are used in the next section.

DEFINITION 4.11. The subset $T_n^* \subseteq T_n^+$ are defined inductively as follows:

(i) $0, 1, \omega_0, \omega_1, \ldots, \omega_{n-1} \in T_n^*$.

(ii) $T_k^* \subseteq T_n^*$ for $k < n$.

(iii) If $\alpha \in T_{n+1}^*, \gamma \in T_n$, and $\beta \in T_n \setminus T_{n-1}^*$, then $\varphi_n(\alpha, \beta) \in T_n^*$ where $T_{-1}^* = \{0\}$.

Note that similarly to the case of the sets $T_n^+$, the definition of $T_n^*$ above differs from that of $T_n^+$ only in the restriction on $\beta$ in (iii). We can prove the same propositions as the case of $T_n^+$ in the same way as the corresponding proofs.

PROPOSITION 4.12 (cf.4.1). Let $\alpha \in T_n$ and $\alpha = (\alpha[\gamma])_{\gamma \in \Omega_m}$. Then $\alpha[\gamma] \in T_n^*$ for every $\gamma \in T_m^*$. Moreover, if $\gamma \in T_m \setminus T_{m-1}^*$, then $\alpha[\gamma] \in T_n^* \setminus T_{m-1}^*$.

DEFINITION 4.13 (cf.4.2). The step-down relations $\prec_k^*$ ($k<\omega$) on $\bigcup_{n<\omega} T_n^*$ are defined inductively as follows: For $\alpha, \beta \in T_n^*$,

$\alpha \prec_k^* \beta$ if $\beta \neq 0$ and one of the following holds:

(i) $\alpha \prec_k^* \gamma$ if $\beta = \gamma + 1$,

(ii) $\alpha \prec_k^* \beta[k]$ if $\beta = (\beta[\gamma])_{\gamma \in \Omega}$,

(iii) $\alpha \prec_k^* \beta[\gamma]$ for all $\gamma \in T_m \setminus (T_m^* \cup \{\omega_m-1\})$. 

If $\beta = (\beta[\gamma])_{\gamma \in \Omega_m}^{(m>0)}$.

**Lemma 4.14 (cf. 4.3).** For $\alpha \in T_{n+1}^*$, $\beta \in T_n^* \setminus T_{n-1}^*$ and $\gamma \in T_n \setminus \{0\}$, we have $\beta \prec_k^* \varphi_n^\gamma(\alpha, \beta)$.

**Lemma 4.15 (cf. 4.4).** Let $\alpha \in T_{n+1}^*$, $\delta, \gamma \in T_n^*$ and $\beta \in T_n^* \setminus T_{n-1}^*$. If $\gamma \prec_k^* \delta$, then $\varphi_n^\gamma(\alpha, \beta) \prec_k^* \varphi_n^\delta(\alpha, \beta)$.

**Lemma 4.16 (cf. 4.5).** Let $\alpha, \gamma \in T_{n+1}^*$, $\beta \in T_n^* \setminus T_{n-1}^*$ and $n > 0$. If $\gamma \prec_k^* \alpha$, then $\varphi_n(\gamma, \beta) \prec_k^* \varphi_n(\alpha, \beta)$.

**Theorem 4.17 (cf. 4.8).** Let $\alpha \in T_n^*$ and $\alpha = (\alpha[\xi])_{\xi \in \Omega_m}$. If $\gamma, \delta \in T_m^*$ and $\gamma \prec_k^* \delta$, then $\alpha[\gamma] \prec_k^* \alpha[\delta]$.

The next lemma is used in the next section.

**Lemma 4.18.** (1) If $\alpha \in T_{m+1}^* \setminus (T_m \cup \{\omega_m\})$, then $\omega_m \prec_k^* \alpha$ for all $k < \omega$.

(2) $k \prec_k^* \omega_0$ for $k < \omega$.

(3) $\omega_i \prec_0^* \omega_n$ for $i < n$.

**Proof.** (1) If $\alpha \in T_{m+1}^* \setminus (T_m \cup \{\omega_m\})$, then $\alpha$ is of the form: $\varphi_{m+1}^\gamma(...) \omega_m \ldots$. Hence 4.14 completes the proof. (2) Trivial for the definition of $\prec_k^*$. (3) It is sufficient to prove that $\omega_i \prec_0^* \omega_{i+1}$. By (1) we have $\omega_i \prec_0^* \alpha$ for all $\alpha \in T_{i+1} \setminus (T_i \cup \{\omega_i\})$. From the definition of $\prec_0^*$ and $\omega_i[\alpha] = \alpha$, this completes the proof. \qed
§5. PROVABLY COMPUTABLE FUNCTIONS IN $\text{ID}^\omega_{\omega}$

5A. In this section we shall prove the following theorem:

**Theorem 5.1.** If a $\Pi^0_2$-sentence $\forall x \exists y A(x, y)$ ($A \in \Sigma^0_1$) is provable in $\text{ID}_\nu(\nu<\omega)$, then there is an $\alpha < \tau'[\nu+1]$ such that for all $n > 1$, there is an $k < F^\alpha(n) A(n, k)$.

Clearly, this theorem implies (III) in Introduction. Here we shall prove this theorem in the same way as Buchholz[4].

5B. **THE SYSTEM $\text{ID}_\nu(\nu<\omega)$.** We introduce the system $\text{ID}_\nu$ for $\nu < \omega$ following [4, Section 4].

**Preliminaries.** Let $L$ denote the first-order language consisting of the following symbols:

(i) the logical constants $\neg, \land, \lor, \forall, \exists$,

(ii) number variables (indicated by $x, y$),

(iii) a constant $0$(zero) and a unary function symbol ' (successor),

(iv) constants for primitive recursive predicates (among them the symbol $<$ for the arithmetic 'less' relation).

By $s, t, t_0, \ldots$ we denote arbitrary $L$-terms. The constant terms $0, 0', 0'', \ldots$ are called numerals; we identify numerals and natural numbers and denote them by $i, j, k, m, n, u, v, w$. A formula of the shape $Rt_1 \cdots t_n$ or $\neg Rt_1 \cdots t_n$, where $R$ is a $n$-ary predicate symbol of $L$, is called an **arithmetic prime formula** (abbreviated by a.p.f.).

Let $X$ be a unary and $Y$ a binary predicate variable. A **positive operator form** is a formula $\Phi_y(X, Y, y, x)$ of $L(X, Y)$ in
which only \(X,Y,y,x\) occur free and all occurrences of \(X\) are positive. The language \(\text{L}_{\text{ID}}\) is obtained from \(L\) by adding a binary predicate constant \(P_{\leq}^\omega\) and a 3-ary predicate constant \(P_{\leq}^\omega\) for each positive operator form \(\omega\).

**Abbreviations.**

\[
\begin{align*}
t \in P_{\leq}^\omega & := P_{\leq}^\omega t := P_{\leq}^\omega st, \\
\Upsilon_{s}(t_0 t_1) & := P_{\leq}^\omega st_0 t_1, \\
\Upsilon_{s}(X,x) & := \Upsilon(X,P_{\leq}^\omega s,s,x).
\end{align*}
\]

The formal theory \(\text{ID}_\nu\) with \(\nu < \omega\) is an extension of Peano Arithmetic, formulated in the language \(\text{L}_{\text{ID}}\), by the following axioms:

\[
\begin{align*}
(P_{\leq}^\omega.1) & \quad \forall y \forall x(\Upsilon_{y}(P_{\leq}^\omega y,x) \rightarrow x \in P_{\leq}^\omega y), \\
(P_{\leq}^\omega.2) & \quad \forall x(\Upsilon_{u}(F,x) \rightarrow F(x)) \rightarrow \forall x(P_{\leq}^\omega u x \rightarrow F(x)), \text{ for each} \\
& \quad \text{L}_{\text{ID}}-\text{formula} F(x) \text{ and each} u < \nu, \\
(P_{\leq}^\omega.3) & \quad \forall y \forall x_0 \forall x_1 (P_{\leq}^\omega \langle y,x_0,x_1 \rangle \leftarrow x_0 < y \land x_1 \epsilon P_{\leq}^\omega x_0).
\end{align*}
\]

**4C. The infinitary system \(\varphi_{\text{ID}}^{\omega} \).** As in [4, Section 4], the infinitary system \(\varphi_{\text{ID}}^{\omega} \) shall be formulated in the language \(\text{L}_{\text{ID}}(N)\) which arises from \(\text{L}_{\text{ID}}\) by adding a new unary predicate symbol \(N\). This is a technical tool which shall help us to keep control over the numerals \(n\) occurring in \(\exists\)-inferences \(A(n) \vdash \exists x A(x)\) of \(\varphi_{\text{ID}}^{\omega}\)-derivations. Following Tait[14] we assume all formulas to be in negation normal form, i.e., the formulas are built up from atomic and negated atomic formulas by means of \(\land, \lor, \forall, \exists\). If \(A\) is a complex formula we consider \(\neg A\) as a notation for the corresponding negation normal form.

**Definition of the length \(|A|\) of a \(\text{L}_{\text{ID}}(N)\)-formula \(A\)**
1. $|\text{Nt}| := |\neg \text{Nt}| := 0.$
2. $|A| := 1,$ if $A$ is an a.p.f. or a formula $(\forall) P^u_s t.$
3. $|P^u_{<S} t_0 t_1| := |\neg P^u_{<S} t_0 t_1| := 2.$
4. $|A \land B| := |A \lor B| := \max(|A|, |B|) + 1.$
5. $|\forall x A| := |\exists x A| := |A| + 1.$

**PROPOSITION 5.2.** $|\forall A| = |A|,$ for each $L_{ID}(N)$-formula $A.$

As before we use the letters $u, v$ to denote numbers $< \omega.$

**Inductive definition of formula sets $\text{Pos}_v(v<\omega)$**

1. All $L(N)$-formulas belong to $\text{Pos}_v.$
2. All formulas $P^u_{<v} t,$ $(\forall) P^u_{<v} t_0 t_1$ with $u \leq v$ belong to $\text{Pos}_v.$
3. All formulas $\neg P^u_{<v} t$ with $u < v$ belong to $\text{Pos}_v.$
4. If $A$ and $B$ belong to $\text{Pos}_v,$ then the formulas $A \land B,$ $A \lor B,$ $\forall x A,$ $\exists x A$ also belong to $\text{Pos}_v.$

**REMARK 5.3.** If $P^u_{<v} t \in \text{Pos}_v,$ then also $P^u_{<v}(t) \in \text{Pos}_v.$

**Notations**

- In the following $A, B, C$ always denote closed $L_{ID}(N)$-formulas.
- $\Gamma, \Gamma', \Delta$ denote finite sets of closed $L_{ID}(N)$-formulas; we write, e.g., $\Gamma, \Delta, A$ for $\Gamma \cup \Delta \cup \{A\}.$
- $A^N$ denotes the result of restricting all quantifiers in $A$ to $N.$
- $t \in N := N t,$ $t \not\in N := \neg N t.$
- As before we use the letters $\alpha, \beta, \gamma, \delta$ to denote elements of $T^*_{\bar{u}}.$

**DEFINITION 5.4.** $\gamma \prec_{\bar{u}} \alpha \iff \gamma \prec_k \alpha,$

where $k := \max(\{3 \cup (3n : \neg N n \in \Gamma)\}).$
PROPOSITION 5.5. (1) $\gamma \preccurlyeq_{\Gamma} \alpha$ and $\Gamma \subseteq \Delta \implies \gamma \preccurlyeq_{\Delta} \alpha$. ((0)-built-upness of all elements of $\mathcal{T}_{n}^{*}$: Theorem 4.17.)

(2) $\gamma \preccurlyeq_{\Gamma \cup \{0 \notin N\}} \alpha \implies \gamma \preccurlyeq_{\Gamma} \alpha$.

Basic inference rules

(A) $A_{0}, A_{1} \vdash A_{0} \land A_{1}$.

(v) $A \vdash A \lor B; B \vdash A \lor B$.

($\forall^{\omega}$) $(A(n))_{n \in \omega} \vdash \forall x A(x)$.

(∃) $A(n) \vdash \exists x A(x)$.

(N) $n \in N \vdash n' \in N$.

($P_{<u}^{\exists}$) $P_{<u}^{\exists} \vdash P_{<u}^{\exists} j n$, if $j < u < \omega$.

($\neg P_{<u}^{\forall}$) $\neg P_{<u}^{\forall} j n \vdash \neg P_{<u}^{\forall} j n$, if $j < u < \omega$.

Every instance $(A_{1})_{i \in I} \vdash A$ of these rules is called a basic inference. If $(A_{1})_{i \in I} \vdash A$ is a basic inference with $A \in \text{Pos}_{V}$, then $A_{1} \in \text{Pos}_{V}$ for all $i \in I$. This property will be used in the proof of 5.10.

The system $\varphi_{ID}^{<\omega}$ consists of the language $L_{ID}(N)$ and a certain derivability relation $\vdash_{m}^{\alpha} \Gamma$ ("$\Gamma$ is derivable with order $\alpha \in \mathcal{T}_{n}^{*}$ and cut degree $m \in \omega"$) which we introduce below by an iterated inductive definition.

**Inductive definition of $\vdash_{m}^{\alpha} \Gamma$ ($\alpha \in \mathcal{T}_{n}^{*}$, $m \in \omega$)**

(Ax1) $\vdash_{m}^{\alpha} \Gamma, A$, if $A$ is a true a.p.f. or $A \equiv 0 \in N$ or $A \equiv \neg P_{<u}^{\exists} j n$ with $u \leq j$.

(Ax2) $\vdash_{m}^{\alpha} \Gamma, \neg A, A$, if $A \equiv n \in N$ or $A \equiv P_{<u}^{\forall}$.

(Bas) If $(A_{1})_{i \in I} \vdash A$ is a basic inference with $A \in \Gamma$ and $\forall i \in I(L_{m}^{\alpha} \Gamma, A_{1})$, then $\vdash_{m+1}^{\alpha+1} \Gamma$. 
(P^u)
\[ \Gamma \vdash_\alpha \Delta, \varphi \text{ and } \Gamma \vdash_\alpha \varphi \text{ for } \varphi \in \Phi \text{ and } \Gamma \vdash_\alpha \varphi \text{ for } \varphi \in \Phi \text{ } \] 
(\text{Cut}) \[ \Gamma \vdash_\alpha \Delta, \varphi \text{ and } \Gamma \vdash_\alpha \neg \varphi \text{ for } \varphi \in \Phi \text{ and } \Gamma \vdash_\alpha \varphi \text{ for } \varphi \in \Phi \text{ } \] 
(\Omega_{u+1}) \[ \forall \varphi \in \Omega_{u+1} \forall \Delta \in \Phi \vdash_\alpha \Delta, \varphi \text{ for } \varphi \in \Phi \text{ and } \Gamma \vdash_\alpha \varphi \text{ for } \varphi \in \Phi \text{ } \] 
(\leq) \[ \Gamma \vdash_\alpha \Delta \text{ and } \beta \leq_\alpha \alpha \Rightarrow \Gamma \vdash_\alpha \Delta \] 

**Lemma 5.6.** (1) \[ \Gamma \vdash_\alpha \Delta \text{ and } \Gamma \vdash_\alpha \Delta \Rightarrow \Gamma \vdash_\alpha \alpha \] 
(2) \[ \Gamma \vdash_\alpha \Delta \Rightarrow \Gamma \vdash_\gamma \Delta \] 
(3) \[ \Gamma \vdash_\alpha \Delta, \varphi \text{ for } \varphi \in \Phi \text{ and } \Gamma \vdash_\alpha \varphi \text{ for } \varphi \in \Phi \text{ } \] 

**Proof.** (cf.[4, Lemma 4.2].) Induction on \( \alpha \) using 5.5 and the relation that \( (\gamma + \alpha)[\delta] = \gamma + \alpha[\delta] \) for all \( \delta \in \Omega_{k} \) with \( \alpha = (\alpha[\delta])_{\delta \in \Omega_{k}} \).

**Lemma 5.7** (Inversion). Let \( (A_i)_{i \in I} \) be a basic inference
(\land), (\forall), (P^u_{<u}), (\neg P^u_{<u}). Then \( \Gamma \vdash \Delta \), \( \Delta \) implies \( \forall i \in I, \Gamma \vdash \Delta \).

**Proof.** Similar to [4, Lemma 4.3] by induction on \( \alpha \).

**Lemma 5.8** (Reduction). Suppose \( \Gamma \vdash_\alpha \Delta, \varphi \text{ and } |\varphi| \leq m, \) where \( \varphi \) is a formula of the shape \( \text{AvB or } \exists x A(x) \) or \( P^u_{<u} \) or \( \neg P^u_{<u} \) or a false a.p.f. Then \( \Gamma \vdash_\alpha \Delta \), \( \varphi \) implies \( \Gamma \vdash_\alpha \Delta \).

**Proof.** Similar to [4, Lemma 4.4] from induction on \( \beta \) and the relation that \( \alpha + (\beta + 1) = (\alpha + \beta) + 1. \)

**Theorem 5.9** (Cut Elimination). \( \Gamma \vdash_\alpha \Delta \) and \( \alpha \in T^*_{\nu} \), \( \nu < \omega \), \( m > 0 \Rightarrow \Gamma \vdash_\alpha \Delta \) where \( z = \varphi_{\nu+1}(1, \varphi_{\nu+1}(1, \varphi_{\nu+1}(2, \omega_{\nu}))) \) for all \( k < \omega. \)
Proof. (cf. [4, Theorem 4.5] ) Induction on $\alpha$. Let $z = \varphi_{v+1}^{\alpha}(1, \varphi_{v+1}^{k}(1, \varphi_{v+1}^{k}(2, \omega_{v}))).$

1. Suppose $\alpha = \gamma + 1$, $A \in \Gamma$ and $\forall \epsilon \in (\Gamma_{m+1}^{\gamma} \Gamma, A_{1})$, where $(A_{1})_{1} \in \Gamma^{A}$ is a basic inference ($\mathfrak{I}$). Then by I.H. we have $\forall \epsilon \in (\Gamma_{m+1}^{\gamma} \Gamma, A_{1})$ where $\beta = \varphi_{v+1}^{\gamma}(1, \varphi_{v+1}^{k}(1, \varphi_{v+1}^{k}(2, \omega_{v}))).$ By ($\mathfrak{I}$) we have $\Gamma_{m+1}^{\alpha} \Gamma$ and then $\Gamma_{m}^{\alpha} \Gamma$ since $\beta + 1 = \varphi_{v+1}^{\alpha}(0, \beta) <_{\alpha} \varphi_{v+1}^{\alpha}(1, \beta) = z$ by 4.5.

2. Suppose $\alpha = \gamma + 1$, $\Gamma_{m+1}^{\gamma} \Gamma, \gamma C$, $\Gamma_{m+1}^{\gamma} \Gamma, C$ and $|C| = m$. Then by I.H. we have $\Gamma_{m}^{\gamma} \Gamma, \gamma C$ and $\Gamma_{m+1}^{\gamma} \Gamma, C$ where $\beta$ is as 1. We may assume that $C$ fulfills the condition of 5.8. By ($\mathfrak{I}$) and 5.8, we have $\Gamma_{m}^{(\beta + 1) + \beta} \Gamma$. Hence $\Gamma_{m}^{\alpha} \Gamma$ since $(\beta + 1) + \beta = \varphi_{v+1}^{\gamma}(0, \varphi_{v+1}^{\gamma}(0, \beta)) = \varphi_{v+1}^{\gamma}(1, \beta) = z$.

3. Suppose $\alpha = \gamma + 3$, $P_{u}^{\gamma} \in \Gamma$ and $\Gamma_{m+1}^{\gamma} \Gamma, C$ with $B = n \in \mathcal{N}_{u}^{\gamma}(P_{u}^{\gamma}, n)$. Then by I.H. and ($\mathfrak{I}$) we have $\Gamma_{m}^{\beta} \Gamma, B$ where $\beta = \varphi_{v+1}^{\gamma}(1, \varphi_{v+1}^{k}(1, \varphi_{v+1}^{k}(2, \omega_{v}))).$ By ($\mathfrak{P}_{u}^{\gamma}$) we get $\Gamma_{m}^{\beta + 3} \Gamma$ and hence $\Gamma_{m}^{\alpha} \Gamma$ since $\beta + 3 = \varphi_{v+1}^{\gamma}(0, \beta) <_{\alpha} \varphi_{v+1}^{\gamma}(1, \varphi_{v+1}^{\gamma}(0, \beta)) = \varphi_{v+1}(1, \beta) = z$.

4. In all other cases the assertion follows from I.H. and the fact that $\beta + 1 = \varphi_{v+1}(0, \beta) <_{\alpha} \varphi_{v+1}(1, \beta) = z$ as in 1 above. \qedsymbol

THEOREM 5.10 (Collapsing Lemma). $\Gamma_{1}^{\alpha} \Gamma$ and $\Gamma \subseteq Pos_{v}$, $\alpha \in T_{v+2}^{\ast}$

$\Rightarrow \Gamma_{1}^{Z} \Gamma$ where $z = \varphi_{v+1}(\alpha, \omega_{v})$.

Proof. (cf. [4, Theorem 4.6] ) Induction on $\alpha$.

1. Suppose $\alpha = (\alpha[\delta])_{\delta \in \Omega_{u+1}^{\ast}}, \Gamma_{1}^{\alpha[1]} \Gamma, P_{u}^{\gamma}$ and $\Gamma_{1}^{\alpha[z]} \Delta, \Gamma$ for all $z \in T_{u+1}^{\ast}, \Delta \subseteq Pos_{u}$ with $\Gamma_{1}^{Z} \Delta, P_{u}^{\gamma}$. Then $u \leq v$.

Case 1. $u < v$. We have $\varphi_{v+1}(\alpha[z], \omega_{v}) = \varphi_{v+1}(\alpha, \omega_{v})[z]$ for all $z \in T_{u+1}^{\ast}$. Hence the assertion follows by ($\Omega_{u+1}^{\ast}$).

Case 2. $u = v$. Then $\Gamma \cup \{P_{u}^{\gamma}\} \subseteq Pos_{u}$ and by I.H. $\Gamma_{1}^{\beta} \Gamma, P_{u}^{\gamma}$ where $\beta = \varphi_{v+1}(\alpha[1], \omega_{v})$. Since $\beta \in T_{u+1}^{\ast}$ we get $\Gamma_{1}^{Z} \Gamma$ where $z =$.
\( \varphi_{v+1}(\alpha[\beta], \omega_v) \). But \( z = \varphi_{v+1}(\alpha[\beta], \omega_v) = \varphi_{v+1}(\alpha, \omega_v) \) from the definition of \( \varphi_{v+1} \) (see 1.10).

2. In all other cases the assertion follows from the I.H. \( \square \)

**DEFINITION 5.11.** \( L(N)_+ := \{ A : A \) is a sentence of \( L(N) \) in which \( N \) occurs only positively\}. For \( \Gamma = \{ A_1, \ldots, A_n \} \subseteq L(N)_+ \), we define:

\[
\mathcal{F}(k) : \iff \begin{cases} 
A_1 \ldots A_n \text{ is true in the standard model} \\
\text{when } N \text{ is interpreted as } \{ i < \omega : 31 < k \}.
\end{cases}
\]

**LEMMA 5.12.**

\[
\Gamma \subseteq L(N)_+, \ n \geq \max\{ 3, 31_1, \ldots, 31_m \} \implies \mathcal{F}(\mathcal{F}(\alpha(n))).
\]

**Proof.** (cf. [4, Lemma 4.7].) Induction on \( \alpha \). Let \( \Gamma_0 = \{ i_1 \in N, \ldots, i_m \in N \} \) and \( k = \max\{ 3, 31_1, \ldots, 31_m \} \leq n \).

1. (Ax1)\( \vdash_1 \Gamma_0, \Gamma \). The assertion is trivial for \( 0 < \mathcal{F}(\alpha(n)) \).

2. (Ax2)\( \vdash_1 \Gamma_0, \Gamma \). The assertion follows from \( n < \mathcal{F}(\alpha(n)) \).

3. If \( \vdash_1 \Gamma_0, \Gamma \) is the conclusion of a basic inference \( \neq (N) \), then the assertion follows from the I.H. and the relation \( \mathcal{F}(\alpha(n)) < \mathcal{F}(\mathcal{F}(\alpha(n))) \).

4. Suppose \( \alpha = \beta+1, N(j+1) \in \Gamma \). By I.H. we have \( \mathcal{F}(\mathcal{F}(\alpha(n))) \). Then we have \( \mathcal{F}^2(\alpha(n)) < \mathcal{F}^3(\alpha(n)) < \mathcal{F}^4(\alpha(n)) \leq \mathcal{F}^{n+1}(\alpha(n)) = \mathcal{F}(\alpha(n)) \). So, \( \mathcal{F}(\alpha(n)) < \mathcal{F}(\alpha(n)) \). Hence \( \mathcal{F}(\mathcal{F}(\alpha(n))) \).

5. Suppose \( \vdash_1 \Gamma_0, \Gamma \) with \( \beta < \Gamma_0 \cup \alpha \). Then we have \( \mathcal{F}(\alpha(n)) < \mathcal{F}(\alpha(n)) \) since \( n \geq k \). The assertion follows from the I.H.

6. Suppose \( \alpha = \beta+1, \vdash_1 \Gamma_0, \Gamma \), \( \mathcal{F}(\alpha(n)) \) and \( \vdash_1 \Gamma_0, \Gamma \). Let \( \Gamma_1 = \mathcal{F}(\alpha(n)) \). Then we have \( \mathcal{F}(\alpha(n)) < \mathcal{F}(\alpha(n)) \).

6.1. \( \mathcal{F}(\alpha(n)) < 31_0 \). From \( \vdash_1 \Gamma_0, \Gamma_1 \in N \) we obtain by the I.H.
$\Gamma \cup \{1_0 \in \mathbb{N}(\hat{n})\}$ and then $\Gamma(\hat{n})$, since $\gamma(31_0 < \hat{n})$. Using $\hat{n} < F_\alpha(n)$ we get the assertion.

6.2. $31_0 \leq \hat{n}$. From $\Gamma(\hat{n})$, $\max\{k, 31_0\} \leq \hat{n}$ we obtain by I.H. $\Gamma(F_\beta(\hat{n}))$ and then $\Gamma(F_\alpha(n))$.

THEOREM 5.13 (Bounding). If $\Gamma_1 \vdash \alpha \forall x \in \mathcal{N}(3y \in \mathcal{N}) A^N(x, y)$, where $0 < \alpha \in T^*_1$, $\nu \leq \omega$, $m > 0$ and $A(x, y)$ a $\Sigma_1^0$-formula of the language $L$, then $\forall n > 1, \exists k < F_\alpha(n)(A(n, k))$.

Proof. (cf. [4, Theorem 4.8].) From the premise we obtain $\Gamma_1 \vdash \alpha \forall n \in \mathcal{N}, \exists y \in \mathcal{N}(A^N(n, y))$ for all $n < \omega$. Then by 5.12 we get $\Gamma(\exists y \in \mathcal{N}(A^N(n, y)))(F_\alpha(\hat{n}))$ for all $n < \omega$ and all $\hat{n} \geq \max\{3, 3n\}$. Hence $\forall n \exists k < F_\alpha(3n+3)A(n, k)$. From $3n + 3 < 4n + 2 = F^2_1(n)$ since $n > 1$. We have $F_\alpha(3n+3) < F_\alpha(F^2_1(n)) < F^3_\alpha(n) \leq F_{\alpha+1}^n(n) = F_{\alpha+1}(n)$ since $1 \leq_1 \alpha$. By $0 < \alpha$ and $1.3(3)$.

4C. EMBEDDING ID_v (v<\omega) INTO ID^\omega_{<\omega}. In the remaining part of this section we show that ID_v (v<\omega) can be embedded into ID^\omega_{<\omega} and finally we prove the theorem that if a $v_2^0$-sentence $\forall x \exists y A(x, y)(A \in \Sigma^0_1)$ is provable in ID_v (v<\omega) then there is an $\alpha < \tau$, such that $\forall n > 1 \exists k < F_\alpha(n)(A(n, k))$.

Abbreviations. $k^\sim = \varphi^{k+1}_v(2, \omega_v)$.

$\alpha \rightarrow_n \beta :\iff \exists \alpha_0, \ldots, \alpha_n(\alpha_0 = \alpha \land \alpha_n = \beta \land \forall 1 < n (\alpha_1 + 1 \leq_2 \alpha_1 + 1))$.

LEMMA 5.14. (1) $k^\sim + 1 \leq^* (k+1)^\sim$. (2) $k^\sim \rightarrow_9 (k+1)^\sim$.

Proof. (cf. [4, Lemma 4.9].) (1) From $\varphi^{k+1}_v(0, k^\sim) \leq^* \varphi^{k+1}_v(2, k^\sim) = (k+1)^\sim$ by 4.5. (2) From the relation that, since $2 \leq_2 k^\sim$, $k^\sim + 3$
\[\xi_2 \varphi_{\nu+1}(1,k^-) \leq_2 \varphi_{\nu+1}(1,k^-) + 3 \leq_2 \varphi_{\nu+1}^2(1,k^-) \leq_2 \varphi_{\nu+1}(1,k^-) + 3 \leq_2 \varphi_{\nu+1}(1,k^-) \leq_2 \varphi_{\nu+1}(2,k^-) = (k+1)^- \]

**Lemma 5.15.** \( \Gamma_0^k \models \forall \varphi, A \) where \( k = |A| \).

**Proof.** Similar to [4, Lemma 1.10].

**Lemma 5.16.** \( \models (k^+1)^+ \cdot \varphi \models \forall x \in N(F(x) \rightarrow F(x')) \), \( n \in N, F(n) \)
where \( k = |F| \).

**Proof.** Similar to [4, Lemma 4.11].

**Definition 5.17.** For \( A \in \text{Pos}_u \) let \( A^* \) denote the result of replacing all occurrences of \( F_u^N \) in \( A \) by \( F(\cdot) \). \( \{A_1, \ldots, A_m\}^* = \{A_1^*, \ldots, A_m^*\} \).

**Proposition 5.18.** \( \Gamma_0 \cup \Gamma \subset \text{Pos}_u, \alpha \in T_u^+(u+1 \leq u), k = |F|, \Gamma_1 \models \gamma \models \Gamma_0,  \forall x \in N(\gamma_u^N(F(x) \rightarrow F(x))), \Gamma^* \).

**Proof.** Similar to [4, P.151 Proposition].

**Lemma 5.19.** \( \alpha \in T_u^*, \Delta \subset \text{Pos}_u, k = |F|, \Gamma_1^\alpha \Delta, F_u^N \rightarrow \gamma_1(k+1)^+ \cdot \alpha \Delta, \gamma \models \forall x \in N(\gamma_u^N(F(x) \rightarrow F(x))), F(n) \).

**Proof.** From 5.18.

**Lemma 5.20.** \( \Gamma_1 (k^+1)^+ \cdot \varphi \rightarrow_1 \gamma \models \forall x \in N(\gamma(u)^N(F(x) \rightarrow F(x))), \gamma F_u^N, F(n) \)
with \( k = |F| \).

THEOREM 5.21. If the sentence $A$ is provable in $\text{ID}_\psi(\forall \omega)$, then there is a $k < \omega$ such that $\models_k^\omega A^N$ where $z = \phi_{\psi}^k(2, \omega^\psi)$.

LEMMA 5.22. (1) $(k^\omega + 1)^{k^\omega} \rightarrow (k^\omega + 2)^{k^\omega}$.
(2) $k^{-4} \leq_3 (k+1)^{-}$.

Proof. (1) $(k^\omega + 1)^{k^\omega} = \varphi_{\psi+1}^k(1, k^\omega) \leq_0 \varphi_{\psi+1}^k(2, k^\omega) = (k^\omega + 1)^{k^\omega} \rightarrow (k^\omega + 2)^{k^\omega}$. (2) $k^{-4} = \varphi_{\psi+1}^k(0, k^\omega) + 3 \leq_3 \varphi_{\psi+1}^k(0, \varphi_{\psi+1}(0, k^\omega)) = \varphi_{\psi+1}^k(1, k^\omega) \leq_0 (k+1)^{-}$.

PROPOSITION 5.23. For every mathematical axiom $A(v_1, \ldots, v_m)$ of $\text{ID}_\psi$, there is a $k < \omega$ such that $\models_1^k A(i_1, \ldots, i_m)^N$ for all $i_1, \ldots, i_m < \omega$. ($v_1, v_2, \ldots$ denote variables of the language $L$.)

Proof. Similar to [4,p.152 Proposition 1] from the relations

$(k^\omega + 1)^{\omega^\psi} \leq_0 (k+1)^{-} = \varphi_{\psi+1}^k(1, k^\omega) \leq_0 (k+1)^{-} \rightarrow (k^\omega + 2)^{k^\omega}$,

$\omega_{\psi+1} \leq_0 \omega^\psi$ and $k^{-4} \leq_3 (k+1)^{-} \rightarrow (k^\omega + 1)^{k^\omega}$.

PROPOSITION 5.24. By PL1 we denote Tait's calculus for first-order predicate logic in the language $L_{\text{ID}}$ (cf.[14]). If $\Gamma(v_1, \ldots, v_m)$ is derivable in PL1, then there is a $k < \omega$ such that $\models_0^k \Gamma \in N, i_1 \in N, \ldots, i_m \in N, \Gamma(i_1, \ldots, i_m)$ for all $i_1, \ldots, i_m < \omega$.

Proof. Similar to [4,p.152 Proposition 2].

Proof of Theorem 5.21. Suppose $\text{ID}_\psi \vdash A$ (A closed). Then PL1 $\vdash$
\(\gamma(A_1 \wedge \cdots \wedge A_n).A\) where every \(A_i\) is the universal closure of an axiom of ID\(\nu\). By 5.23 and 5.24, there is an \(m < \omega\) such that \(\forall^m(A_1 \wedge \cdots \wedge A_n)^N\) and \(\forall^0(A_1 \wedge \cdots \wedge A_n)^N, A^N\). By a cut with cut formula \((A_1 \wedge \cdots \wedge A_n)^N\) we obtain now \(\forall^k \lceil A^N\) with \(k = \max\{|(A_1 \wedge \cdots \wedge A_n)^N|, m\} + 1\), since \(\forall^k B \Rightarrow \forall^k(B^N)\).

**Proof of Theorem 5.1.** Suppose ID\(\nu\) \(\vdash A\) (\(A\) closed). Then by 5.21, \(\exists^\alpha A^N\) where \(\alpha = \forall^{k+1}(2, \omega)\) for some \(0 < k < \omega\). If \(k > 1\), then by 5.9(Cutelimination) \(\forall^\alpha A^N\) where

\[
\alpha' = \forall^{\alpha_1}(1, \forall^{k+1}(2, \omega)) = \forall^{\alpha_1}(1, \forall^{k+1}(1, \alpha)) = \forall^{k+1}(2, \alpha) = \forall^{k+1}(2, \omega).
\]

By iterating this argument, we obtain \(\forall^\beta A^N\) where

\[
\beta = \forall^{k+m}(2, \omega)\text{ for some } m < \omega.
\]

Then by iterating 5.10(Collapsing) we have \(\forall^{\gamma} A^N\) where

\[
\gamma = \forall(\ldots \forall(\forall^{k+m}(2, \omega), \omega_{v-1}), \omega_0).
\]

And we have \(\gamma < \tau'[\nu+1]\) since

\[
\gamma = \forall(\ldots \forall(\forall^{k+m-1}(2, \forall^{k+1}(2, \omega)), \omega_{v-1}), \omega_0) < \forall(\ldots \forall(\forall^{0}(2, \forall^{k+1}(2, \omega)), \omega_{v-1}), \omega_0) < \forall(\ldots \forall(\forall(z, \omega)(2, \forall^{k+1}(2, \omega)), \omega_{v-1}), \omega_0) < \forall(\ldots \forall(\forall(z_{v-1}, \omega)(2, \forall^{k+1}(2, \omega)), \omega_{v-1}), \omega_0)
\]

where \(z = \forall(\ldots \forall(\forall^{1}(2, \forall^{k+1}(2, \omega)), \omega_{v-1}), \omega_0)\).

Hence \(\gamma < \tau'[\nu+1] < \tau'\). Also \(\gamma+1 < \tau'[\nu+1]\) since \(\gamma \in T_1\) and \(\tau'[\nu+1]\) is (0)-built-up. By 5.13(Bounding) we have \(\forall \nu(n+1)\), \(\exists k < F^{\nu+1}(n)(A(n, k))\).
