Factorization of matrix polynomials and its applications to partial differential operators

Hiroya ITO

1. Introduction

We consider the quadratic form

\[ a[u] = \int_{\Omega} \sum_{j,k=1}^{n} \langle A^{jk} \partial_{x_{k}} u, \partial_{x_{j}} u \rangle \, dx \]

on the space \( H^1(\Omega) := H^1(\Omega; \mathbb{C}^N) \) of \( N \)-vector \( H^1 \) functions \( u \) on a domain \( \Omega \) of \( \mathbb{R}^n \) \((n \geq 2, N \geq 1)\) with constant coefficients \( A^{jk} \in \mathcal{M}_N \) having the symmetry relations

\[ (A^{jk})^* = A^{kj}, \quad 1 \leq j,k \leq n, \]

where \( \langle \cdot, \cdot \rangle \) denotes the hermitian inner product on \( \mathbb{C}^N \), \( \mathcal{M}_N = \mathcal{M}_{N,N} \) with \( \mathcal{M}_{\ell,m} \) the set of complex \( \ell \times m \) matrices, and \((A^{jk})^*\) the adjoint of \( A^{jk} \). Note that by (1.2) \( a[\cdot] \) is real-valued.

It is fundamental in PDE theory to examine the coercivity or the positivity of quadratic forms such as \( a[\cdot] \) on \( H^1(\Omega) \) or its certain subspaces. Our first aim is to describe, in terms of the coefficients \( A^{jk} \), conditions for the following basic inequalities to hold:

\[ a[u] \geq c_K \| \nabla u \|^2 \quad \forall u \in H^1(\mathbb{R}^n) \text{ or } H^1(\mathbb{R}^n_+), \]

\[ a[u] \geq c_P \| u \|^2 \quad \forall u \in H^1_0(\Omega_1) \text{ or } 0H^1(\Omega_1) \]

\[ a[u] \geq c_S [u]^2 \quad \forall u \in 0H^1(\Omega_1) \]

with some positive constants \( c_K, c_P, c_S \), where \( \| \cdot \| \) stands for the \( L^2 \) norm on the domain considered, \( \mathbb{R}^n_+ = \{(x', x_n); x_n > 0\} \) the upper half space, \( \Omega_1 = \{(x', x_n); 0 < x_n < 1\} \) a slab in \( \mathbb{R}^n \), and \([u]^2 = \int_{\mathbb{R}^{n-1}} |u(x',0)|^2 \, dx'\) for \( u \in 0H^1(\Omega_1) := \{v \in H^1(\Omega_1); v|_{x_n=1} = 0\} \).
Our strategy for attacking the problem mentioned above is *symmetric factorization of positive-semidefinite matrix-polynomials*: it is known (see Jakubovič [5], Gohberg, Lancaster & Rodmann [3], [4]) that, if a matrix polynomial \( H(\tau) \) in the form

\[
(1.6) \quad H(\tau) = H_2 \tau^2 + H_1 \tau + H_0 \quad \text{with } H_2, H_1, H_0 \in \mathcal{M}_N \text{ hermitian and } H_2 > O
\]
satisfies \( H(\alpha) \geq O \) for all \( \alpha \in \mathbb{R} \), then there exists a matrix \( \Lambda \in \mathcal{M}_N \) such that

\[
(1.7) \quad H(\tau) = (I\tau - \Lambda^*)H_2(I\tau - \Lambda) \quad \text{as polynomial in } \tau.
\]

For the purpose of application to the inequalities above (and to more general PDE's of second order) we investigate some properties, suitable for that use, of such a \( \Lambda \) as satisfies (1.7). This is our second aim in the present paper.

The following §2 will be devoted to factorization of matrix polynomials of form (1.6). In §3, using the technique developed in §2, we shall reveal to some extent the relationship between the coefficients \( A^{jk} \) of (1.1) and the validity of inequalities (1.3)–(1.5). If \( n = 2 \) or if \( N = 1 \) in particular, our method will be so powerful that we can obtain satisfactory results. The results in §3 will be roughly proved in §4. Finally, in §5 we shall apply results obtained in §3 to the following two practical cases:

Example 1: the scalar case.

\[
(1.8) \quad a[u] = \int_{\Omega_1} \sum_{j,k=1}^{n} A^{jk} \partial_{x_j} u \overline{\partial_{x_k} u} \, dx \quad \text{for } \, i \in H^1(\Omega_1) \quad (N = 1).
\]

Example 2: the case of linear isotropic elasticity:

\[
(1.9) \quad a[u] = \lambda \| \text{div} \, u \|^2 + 2\mu \| \varepsilon(u) \|^2 \quad \text{for } \, u \in H^1(\Omega_1; \mathbb{C}^n) \quad (n = N \geq 2),
\]

where \( \lambda, \mu \in \mathbb{R} \) are the Lamé moduli and \( \varepsilon(u) \) denotes the symmetric part of \( \nabla u \): \( \varepsilon(u) = 2^{-1} \left( \nabla u + (\nabla u)^T \right) \).
2. Factorization of matrix polynomials

Let \( H(\tau) \) be as in (1.6). It is known (for details see [2, Chap. VI], [4, Chap. S1], etc.) that, by applying a sequence of elementary transformations, \( H(\tau) \) can be reduced to a diagonal polynomial matrix

\[
D(\tau) = \begin{pmatrix}
  d_1(\tau) \\
  d_2(\tau) \\
  \vdots \\
  d_N(\tau)
\end{pmatrix}
\]  

with monic (i.e., the leading coefficient is 1) scalar polynomials \( d_j(\tau) \) such that \( d_j(\tau) \) is divisible by \( d_{j-1}(\tau) \); in other words there are matrix polynomials \( P(\tau) \) and \( Q(\tau) \) with constant nonzero determinants such that

\[
D(\tau) = P(\tau) H(\tau) Q(\tau).
\]  

While the invertible matrix polynomials \( P(\tau) \) and \( Q(\tau) \) in (2.2) are not uniquely determined, the scalar polynomials \( d_1(\tau), d_2(\tau), \ldots, d_N(\tau) \) are uniquely defined. Indeed, denoting by \( g_j(\tau) \) the G.C.D. of the minors of \( H(\tau) \) of order \( j \), we have

\[
d_1(\tau) = g_1(\tau) \quad \text{and} \quad d_j(\tau) = g_j(\tau)/g_{j-1}(\tau) \quad \text{for} \quad 2 \leq j \leq N.
\]

We call \( D(\tau) \) the Smith form of \( H(\tau) \) and \( d_1(\tau), d_2(\tau), \ldots, d_N(\tau) \) the invariant polynomials of \( H(\tau) \). Note that the invariant polynomials of \( H(\tau) \) considered here are with real coefficients. Now we represent each of them as a product of irreducible factors over the field \( \mathbb{K} = \mathbb{C} \) or \( \mathbb{R} \):

\[
d_j(\tau) = \phi_{j1}(\tau)^{p_{j1}} \phi_{j2}(\tau)^{p_{j2}} \cdots \phi_{jk_j}(\tau)^{p_{jk_j}}, \quad 1 \leq j \leq N,
\]

where \( \phi_{j1}(\tau), \ldots, \phi_{jk_j}(\tau) \) are all the distinct factors of \( d_j(\tau) \) over \( \mathbb{K} \), and \( p_{j1}, \ldots, p_{jk_j} \in \mathbb{N} \) (positive integers). The factors \( \phi_{jk}(\tau)^{p_{jk}} \) \( (1 \leq k \leq k_j, 1 \leq j \leq N) \) are called the elementary divisors of \( H(\tau) \) if \( \mathbb{K} = \mathbb{C} \), and the real elementary divisors if \( \mathbb{K} = \mathbb{R} \).
Theorem 2.1. (cf. Gohberg et al. [3], [4]) For a matrix polynomial $H(\tau)$ of form (1.6), the following three conditions are equivalent:

(i) $H(\tau) \geq O$ for all $\tau \in \mathbb{R}$.

(ii) There exists a matrix $\Lambda \in \mathcal{M}_N$ which satisfies (1.7).

(iii) The real elementary divisors of $H(\tau)$ have the forms

$$
\{ (\tau - \overline{\alpha}_\ell)(\tau - \alpha_\ell) \}^{p_\ell}, \quad 1 \leq \ell \leq L
$$

with $\alpha_\ell \in \mathbb{C}$ and $p_\ell \in \mathbb{N}$ satisfying $\sum_{\ell=1}^{L} p_\ell = N$.

Furthermore, under condition (iii), we can construct a $\Lambda \in \mathcal{M}_N$ which satisfies (1.7) and whose Jordan form is

$$
\bigoplus_{\ell=1}^{L} J(\alpha_\ell, p_\ell) = \begin{pmatrix}
J(\alpha_1, p_1) & & \\
& \ddots & \\
& & J(\alpha_L, p_L)
\end{pmatrix},
$$

where $J(\alpha, p)$ denotes a Jordan block of size $p$ and eigenvalue $\alpha$.

For convenience of explanation we define three sets $\mathfrak{X}, \mathfrak{X}_0, \mathfrak{X}_1$ of matrix polynomials by

$\mathfrak{X} = \{ H(\tau) = H_2\tau^2 + H_1\tau + H_0; \ H_2, H_1, H_0 \in \mathcal{M}_N \text{ and hermitian} \}$,

$\mathfrak{X}_0 = \{ H(\tau) \in \mathfrak{X}; \ H(\alpha) \geq O \ \forall \alpha \in \mathbb{R} \text{ and } H_2 > O \}$,

$\mathfrak{X}_1 = \{ H(\tau) \in \mathfrak{X}; \ H(\alpha) > O \ \forall \alpha \in \mathbb{R} \} \subset \mathfrak{X}_0 \subset \mathfrak{X}$.

We can identify $\mathfrak{X}$ with the set of triplets $(H_2, H_1, H_0)$ of hermitian matrices of order $N$, so with $(\mathbb{R}^N \times \mathbb{C}^{N(N-1)/2})^3 \cong \mathbb{R}^{3N^2}$. Given $H(\tau) \in \mathfrak{X}_0$ we are interested in a matrix $\Lambda$ which satisfies (1.7) and all whose eigenvalues are included in the closed upper half $\mathbb{C}_+ = \{ z \in \mathbb{C}; \mathbb{R} \leq \arg(z) \leq \pi \}$.
\{z \in \mathbb{C}; \text{Im} z \geq 0\} \text{ of the complex plane } \mathbb{C}. \text{ The last assertion of Theorem 2.1 guarantees the existence of such a } \Lambda, \text{ and the following proposition shows an explicit construction of it. Later, this } \Lambda \text{ will prove to be unique (Theorem 2.4).}

**Proposition 2.2.** Let \( H(\tau) \in \mathcal{X}_0 \). First, by means of elementary transformations, represent \( H(\tau) \) in form (2.2). Second, express the real elementary divisors of \( H(\tau) \) as the form (2.3) but with \( \alpha_\ell \in \overline{\mathbb{C}}_+ \) for all \( 1 \leq \ell \leq L \). For each \( \ell \) let \( e^{(\ell)} \) be the unit vector in \( \mathbb{C}^N \) such that the \( j_\ell \)-th element is 1 and the others are 0, where \( j_\ell \) is the index such that the elementary divisor \( \{(\tau-\alpha_\ell)(\tau-\alpha_\ell)^{p_\ell}\} \) is chosen out of \( d_{j_\ell}(\tau) \). Finally, using \( Q(\tau) \) and \( e^{(\ell)} \) given above, define a matrix \( R \) by

\[
\begin{align*}
\begin{cases}
 r_k^{(\ell)} &= \frac{1}{(k-1)!} Q^{(k-1)}(\alpha_\ell) e^{(\ell)} \in \mathbb{C}^N, & 1 \leq k \leq p_\ell, \\
 R^{(\ell)} &= (r_1^{(\ell)} r_2^{(\ell)} \ldots r_{p_\ell}^{(\ell)}) \in \mathcal{M}_{N,p_\ell}, & 1 \leq \ell \leq L, \\
 R &= (R^{(1)} R^{(2)} \ldots R^{(L)}) \in \mathcal{M}_N,
\end{cases}
\end{align*}
\]

where \( Q^{(k-1)}(\alpha_\ell) = \left(\frac{d}{d\tau}\right)^{k-1}Q(\tau)|_{\tau=\alpha_\ell} \). Then \( R \) is nonsingular. Furthermore the matrix

\[
\Lambda = R \left( \bigoplus_{\ell=1}^L J(\alpha_\ell, p_\ell) \right) R^{-1}
\]

satisfies (1.7) and its spectrum \( \sigma(\Lambda) \) is included in \( \overline{\mathbb{C}}_+ \).

**Proposition 2.3.** Let \( H(\tau) \in \mathcal{X}_0 \) and let \( \Lambda \) be a matrix such that (1.7) is valid and \( \sigma(\Lambda) \subset \overline{\mathbb{C}}_+ \). Define a subspace \( V_1 \) of \( \mathbb{C}^N \) by

\[
V_1 = \bigoplus_{\alpha \in \sigma(\Lambda) \cap \mathbb{C}_+} \ker (\alpha I - \Lambda)^N.
\]

Then we have the following:

(i) Given \( d \in \mathbb{C}^N \) the boundary-value problem

\[
\begin{align*}
&H(D_t)u(t) = 0 \quad \text{for} \quad 0 < t < 1, \\
u(0) = d, \quad u(1) = 0 \quad (D_t = \frac{d}{dt})
\end{align*}
\]
admits a unique solution \( u \), which is given by

\[
u(t) = e^{it\Lambda} \left\{ I - \left( \int_0^t e^{-is\Lambda} H_2^{-1} e^{is\Lambda^*} \, ds \right) \left( \int_0^1 e^{-is\Lambda} H_2^{-1} e^{is\Lambda^*} \, ds \right)^{-1} \right\} d.
\]

(ii) Given \( d \in V_1 \) the boundary-value problem

\[
\begin{cases}
H(D_t)u(t) = 0 \text{ for } t > 0, \\
u(0) = d, \quad u(t) \to 0 \text{ as } t \to \infty
\end{cases}
\]

admits a unique solution \( u \), which is given by

\[
u(t) = e^{it\Lambda} d.
\]

Conversely if the problem has a solution \( u \), then there must be \( d \in V_1 \).

**Theorem 2.4.** Let \( H = H(\tau) \in \mathcal{X}_0 \). Then there exists a unique \( \Lambda \in M_N \) such that \( (1.7) \) holds and the spectrum \( \sigma(\Lambda) \) of \( \Lambda \) is included in \( \overline{c_+} = \{ \text{Im} \, z \geq 0 \} \). Furthermore, the mapping \( \lambda : \mathcal{X}_0 \to M_N \) defined by \( \lambda(H) = \Lambda \) is continuous on \( \mathcal{X}_0 \) and real-analytic in \( \mathcal{X}_1 \).

If \( H \in \mathcal{X}_1 \) in particular, \( \lambda(H) \) is represented as

\[
\lambda(H) = \left( \int_\Gamma H(z)^{-1} dz \right)^{-1} \left( \int_\Gamma z H(z)^{-1} dz \right),
\]

where \( \Gamma \) is a contour in \( \mathbb{C}_+ = \{ \text{Im} \, z > 0 \} \) with \( \sigma(\Lambda) \) inside.

Given \( H = H(\tau) \in \mathcal{X}_0 \) let \( \Lambda = \lambda(H) \). We define two subspaces \( V_0(H), V_1(H) \) of \( \mathbb{C}^N \) by

\[
(2.6) \quad V_0(H) = \bigoplus_{\alpha \in \sigma(\Lambda) \cap \mathbb{R}} \ker(\alpha I - \Lambda)^N, \quad V_1(H) = \bigoplus_{\alpha \in \sigma(\Lambda) \cap \mathbb{C}_+} \ker(\alpha I - \Lambda)^N;
\]

\( \ker(\alpha I - \Lambda)^N \) is so-called the generalized eigenspace of \( \Lambda \) corresponding to \( \alpha \in \sigma(\Lambda) \). With the notation \( (2.4) \) used in Proposition 2.2, these spaces are expressed more explicitly as

\[
(2.7) \quad V_0(H) = \bigoplus_{\ell, \alpha \in \mathbb{R}} S[\nu_1^{(0)}, \nu_2^{(0)}, \ldots, \nu_P^{(0)}], \quad V_1(H) = \bigoplus_{\ell, \alpha \in \mathbb{C}_+} S[\nu_1^{(0)}, \nu_2^{(0)}, \ldots, \nu_P^{(0)}],
\]
where \( S[r^{(q)}_{1}, \ldots, r^{(q)}_{p\ell}] \) denotes the linear subspace of \( \mathbb{C}^{N} \) generated by \( r^{(q)}_{1}, \ldots, r^{(q)}_{p\ell} \). We note that \( V_{0}(H) \oplus V_{1}(H) = \mathbb{C}^{N} \), and that if \( H \in \mathfrak{X}_{1} \) then \( V_{0}(H) = \{0\} \) and \( V_{1}(H) = \mathbb{C}^{N} \). Further note that, by Theorem 2.3, given \( H \in \mathfrak{X}_{0} \) the \( V_{1} \) in (2.5) and the \( V_{1}(H) \) in (2.6) are the same.

Now we write \( \hat{H}(\tau) = H(-\tau) \) for \( H \in \mathfrak{X}_{0} \); note that \( H \in \mathfrak{X}_{0} \) if and only if \( \hat{H} \in \mathfrak{X}_{0} \). The following theorem explains how the positive semidefiniteness of \( H(\tau) \) is reflected in \( \lambda(H) \) (and \( \lambda(\hat{H}) \)).

**Theorem 2.5.** Let \( H \in \mathfrak{X}_{0} \). Then the matrix

\[
K = (2i)^{-1}H_{2}(\lambda(H) + \lambda(\hat{H}))
\]

is hermitian and satisfies

\[
(i) \quad K \geq O, \quad (ii) \quad \ker K = V_{0}(H).
\]

If \( H_{2}, H_{1}, H_{0} \) are real matrices in addition, then \( \lambda(\hat{H}) = -\overline{\lambda(H)} \), so that \( K = H_{2}\text{Im}\lambda(H) \), where \( \text{Im}\Lambda \) denotes the imaginary part of \( \Lambda : \text{Im}\Lambda = (\Lambda - \overline{\Lambda})/(2i) \).

We give a proof only to Theorem 2.5 because it is the most important in this section.

For convenience of explanation we write \( \Lambda_{\pm} = \lambda(H(\pm\tau)) \) and set for \( \varepsilon > 0 \)

\[
H_{0}^{\varepsilon} = H_{0} + \varepsilon I, \quad H^{\varepsilon}(\tau) = H(\tau) + \varepsilon I,
\]

\[
\Lambda_{\pm}^{\varepsilon} = \lambda(H^{\varepsilon}(\pm\tau)), \quad K^{\varepsilon} = (2i)^{-1}H_{2}(\Lambda_{+}^{\varepsilon} + \Lambda_{-}^{\varepsilon}).
\]

Since \( H^{\varepsilon}(\pm\tau) \in \mathfrak{X}_{1} \), we see from Theorem 2.4 that, given \( d \in \mathbb{C}^{N} \), \( u_{\pm}^{\varepsilon}(t) := e^{it\Lambda_{\pm}^{\varepsilon}}d \) are the unique solutions of the problems

\[
\begin{cases}
H^{\varepsilon}(\pm D_{t})u_{\pm}^{\varepsilon}(t) = 0 & \text{for } t > 0, \\
u_{\pm}^{\varepsilon}(0) = d, & u_{\pm}^{\varepsilon}(1) = 0.
\end{cases}
\]
Now define quadratic forms $\mathfrak{h}_+^\epsilon[u]_I$ on $H^1(I)$, $I$ being an open interval in $\mathbb{R}$, by

$$\mathfrak{h}_+^\epsilon[u]_I = (H_2 u', u')_{L^2(I)} \pm \text{Im} (H_1 u', u)_{L^2(I)} + (H_0^\epsilon u, u)_{L^2(I)}$$

for $u \in H^1(I)$,

where $u' = du/dt$. If we set further

$$G(\tau) = -i(H_2 \tau + 2^{-1}H_1),$$

integration by parts gives

$$\mathfrak{h}_+^\epsilon[u_\pm^\epsilon]_{R_+} = \langle (\pm G(\pm D_t)u_\pm^\epsilon)(0), u_\pm^\epsilon(0) \rangle = \langle -i(H_2 \Lambda_\pm^\epsilon \pm 2^{-1}H_1)d, d \rangle$$

The function $v^\epsilon(t)$ defined by

$$v^\epsilon(t) = u_+^\epsilon(t) \quad \text{for } t \geq 0, \quad = u_-^\epsilon(-t) \quad \text{for } t < 0$$

is in $H^1(\mathbb{R})$ and satisfies $\mathfrak{h}_+^\epsilon[v^\epsilon]_\mathbb{R} = \mathfrak{h}_+^\epsilon[u_+^\epsilon]_\mathbb{R}_+ + \mathfrak{h}_-^\epsilon[u_-^\epsilon]_\mathbb{R}_+$. Furthermore we have by the Fourier transformation

$$\mathfrak{h}_+^\epsilon[v^\epsilon]_\mathbb{R} = \int_\mathbb{R} \langle H^\epsilon(\tau)\hat{v}^\epsilon(\tau), \hat{v}^\epsilon(\tau) \rangle \, d\tau \geq 0$$

Thus it follows from (2.8) and (2.9) that

$$2 \langle K^\epsilon d, d \rangle = \mathfrak{h}_+^\epsilon[u_+^\epsilon]_\mathbb{R}_+ + \mathfrak{h}_-^\epsilon[u_-^\epsilon]_\mathbb{R}_+ = \mathfrak{h}_+^\epsilon[v^\epsilon]_\mathbb{R} \geq 0 \quad \forall d \in \mathbb{C}^N,$$

where we tend $\epsilon \to 0$ to obtain $\langle Kd, d \rangle \geq 0$ for all $d \in \mathbb{C}^N$. Since this implies that $K$ satisfies (i) above, our remaining task is to show $\ker K = V_0(H)$. For simplicity we set

$$V_0^\pm = V_0(H(\pm \tau)), \quad V_1^\pm = V_1(H(\pm \tau)).$$

We begin with showing $V_0^\pm \subset \ker K$. In order to find the explicit forms, such as in (2.6), of $V_0^\pm$, choose invertible matrix polynomials $P(\tau)$ and $Q(\tau)$ such that $P(\tau)H(\tau)Q(\tau)$
is the Smith form of $H(\tau)$. Then $\hat{P}(\tau)\hat{H}(\tau)\hat{Q}(\tau)$ is the Smith form of $\hat{H}(\tau) = H(-\tau)$. If the real elementary divisors of $H(\tau)$ are given by

$$
\{(\tau - \overline{\alpha_{\ell}})(\tau - \alpha_{\ell})\}^{p_{\ell}}, \quad 1 \leq \ell \leq L,
$$

(2.10) then those of $\hat{H}(\tau)$ are given by

$$
\{(\tau + \alpha_{\ell})(\tau + \overline{\alpha_{\ell}})\}^{p_{\ell}}, \quad 1 \leq \ell \leq L.
$$

(2.11)

For the elementary divisors (2.10) of $H(\tau)$ and (2.11) of $\hat{H}(\tau)$ we set respectively

$$
r_{k}^{(\ell)} = \frac{1}{(k-1)!}Q^{(k-1)}(a_{\ell})e^{(\ell)}, \quad \hat{r}_{k}^{(\ell)} = \frac{1}{(k-1)!}\hat{Q}^{(k-1)}(-\overline{\alpha_{\ell}})e^{(\ell)}
$$

for $1 \leq k \leq p_{\ell}$ and $1 \leq \ell \leq L$. If $\alpha_{\ell} \in \mathbb{R}$ in particular, then $\hat{r}_{k}^{(\ell)} = (-1)^{k-1}r_{k}^{(\ell)}$, so that

$$
V_{0^{+}} = V_{0^{-}} = \bigoplus_{\ell; \alpha_{\ell} \in \mathbb{R}}\sum_{1 \leq k \leq p_{\ell}}\mathbb{C}^{N} = \sum_{1 \leq m \leq M} V_{0^{-}}(\beta_{m}) = \ker(\beta_{m}I - \Lambda_{-})^{N}.
$$

Moreover, for such $\ell$,

$$
2 \langle Kr_{k}^{(\ell)}, r_{k}^{(\ell)} \rangle = \text{Im} \left( \langle H_{2}\Lambda_{+}r_{k}^{(\ell)}, r_{k}^{(\ell)} \rangle + \langle H_{2}\Lambda_{-}r_{k}^{(\ell)}, r_{k}^{(\ell)} \rangle \right)
$$

$$
= \text{Im} \left( \langle H_{2}(\lambda_{\ell}r_{k}^{(\ell)} + r_{k-1}^{(\ell)}), r_{k}^{(\ell)} \rangle + \langle H_{2}(-\lambda_{k-1}\hat{r}_{k}^{(\ell)} + \hat{r}_{k-1}^{(\ell)}), \hat{r}_{k}^{(\ell)} \rangle \right) = 0,
$$

where we have used the notation $r_{0}^{(\ell)} = 0$. Hence by (i) we obtain $Kr_{k}^{(\ell)} = 0$ for all $\ell$ such that $\alpha_{\ell} \in \mathbb{R}$.

Finally, suppose that $V_{0^{+}} (= V_{0^{-}}) \neq \ker K$. Let $\beta_{1}, \beta_{2}, \ldots, \beta_{M} \in \mathbb{C}_{+}$ be the distinct imaginary eigenvalues of $\Lambda_{-}$. Then we have

$$
V_{1}^{-} = \bigoplus_{1 \leq m \leq M} V^{-}(\beta_{m}) \quad \text{with} \quad V^{-}(\beta_{m}) = \ker(\beta_{m}I - \Lambda_{-})^{N}.
$$

(2.12)

Since $\mathbb{C}^{N} = V_{0^{-}} \oplus V_{1}^{-}$ and $V_{0^{-}} \subset \ker K$, the supposition above implies that there is a nontrivial $r \in \ker K \cap V_{1}^{-}$. We decompose this $r$ to the sum corresponding to (2.12):

$$
r = \sum_{1 \leq m \leq M} r_{m} \quad \text{with} \quad r_{m} \in V^{-}(\beta_{m}).$$
Choose $m_1$ such that $r_{m_1} \neq 0$ and $p_1$ such that

$$(\beta_{m_1}I - \Lambda_-)^{p_1}r_{m_1} \neq 0, \quad (\beta_{m_1}I - \Lambda_-)^{p_1+1}r_{m_1} = 0,$$

and define $\tilde{r} \neq 0$ by

$$\tilde{r} = \left( \prod_{1 \leq m \leq M, m \neq m_1} (\beta_kI - \Lambda_-)^{N} \right) (\beta_{m_1}I - \Lambda_-)^{p_1}r.$$

Then it follows that $\Lambda_{-}\tilde{r} = \beta_{m_1}\tilde{r}$. On the other hand, since $r \in \ker K = \ker (\Lambda_+ + \Lambda_-)$, we have $\tilde{r} \in \ker (\Lambda_+ + \Lambda_-)$. Hence we arrive at a contradiction that $\Lambda_+\tilde{r} = -\Lambda_-\tilde{r} = -\beta_{m_1}\tilde{r}$.

Therefore $V_0^+ (= V_0^-) = \ker K$.

3. Positivity of the quadratic form $a[\cdot]$

The quadratic form $a[\cdot]$ of (1.1) with $\Omega = \mathbb{R}_+^n$ determines differential operators $A = A(D)$ in $\mathbb{R}_+^n$ and $B = B(D)$ on $\partial \mathbb{R}_+^n$ whose symbols are respectively

$$A(\xi) = \sum_{j,k=1}^{n} A^{jk} \xi_j \xi_k, \quad B(\xi) = -i \sum_{k=1}^{n} A^{nk} \xi_k \quad \text{for} \quad \xi \in \mathbb{R}^n.$$

Indeed, integration by parts gives

$$a[u] = \int_{\mathbb{R}_+^n} \langle Au, u \rangle \, dx + \int_{\partial \mathbb{R}_+^n} \langle Bu, u \rangle \, ds' \quad \forall u \in H^2(\mathbb{R}_+^n).$$

Let $A(\xi) \geq O$ for all $\xi$ and $A^{nn} = A(0, \ldots, 0, 1) > O$. Then, by Theorem 2.2, for each $\eta \in \mathbb{R}^{n-1}$ there exists a $\Lambda(\eta) \in \mathcal{M}_N$ such that $\sigma(\Lambda(\eta)) \subset \overline{\mathbb{C}_+}$ and

$$A(\eta, \tau) = \left( I\tau - \Lambda(\eta)^* \right) A^{nn} \left( I\tau - \Lambda(\eta) \right) \quad \text{as a polynomial of} \ \tau.$$

By means of this $\Lambda(\eta)$ we define for each $\eta \in \mathbb{R}^{n-1}$

\begin{equation}
(3.1) \quad T(\eta) = -i \left( \sum_{k=1}^{n-1} A^{nk} \eta_k + A^{nn} \Lambda(\eta) \right),
\end{equation}

$$V_0(\eta) = \bigoplus_{\alpha \in \sigma(\Lambda(\eta)) \cap \mathbb{R}} \ker \left( \alpha I - \Lambda(\eta) \right)^N (= V_0(A(\eta, \tau))).$$
Note that $T(\eta)$ is a hermitian matrix-valued continuous function of $\eta \in \mathbb{R}^{n-1}$ which is positively homogeneous in $\eta$ of degree 1 (i.e., $T(r\eta) = rT(\eta) \forall r > 0$).

Let $\mathcal{A}$ be a strongly elliptic system, that is, let $A(\xi) > O$ for all $\xi \in S^{n-1} := \{ |\xi| = 1 \}$.

Then, given $\phi \in H^{1/2}(\partial \mathbb{R}^n_+)$, the Dirichlet problem

\begin{equation}
Au = 0 \quad \text{in} \quad \mathbb{R}^n_+ , \quad u = \phi \quad \text{on} \quad \partial \mathbb{R}^n_+ \tag{3.2}
\end{equation}

has a unique $H^2$ solution $u$. We define a mapping $T : H^{1/2}(\partial \mathbb{R}^n_+) \to H^{3/2}(\partial \mathbb{R}^n_+)$ by

$$T\phi = Bu\big|_{x_n=0}$$

using the unique $H^2$ solution $u$ of (3.2); $T$ is called the Dirichlet-to-Neumann map for $\{\mathcal{A}, \mathcal{B}\}$.

**Proposition 3.1.** Let $\mathcal{A}$ be a strongly elliptic system. Then the symbol of the Dirichlet-to-Neumann map $T$ for $\{\mathcal{A}, \mathcal{B}\}$ is equal to the $T(\eta)$ defined in (3.1). Moreover $T(\eta)$ is real-analytic in $\eta \in S^{n-2}$.

**Inequality (1.3).**

It is well-known under what condition on the coefficients $A^{jk}$ inequality (1.3) holds.

**Theorem 3.2.** The following is a necessary and sufficient condition for inequality (1.3) to hold for some constant $c_K > 0$:

Case 1 : on the space $H^1(\mathbb{R}^n)$. $A(\xi) > O \ \forall \xi \in S^{n-1}$.

Case 2 : on the space $H^1(\mathbb{R}^n_+)$. $A(\xi) > O \ \forall \xi \in S^{n-1}$ and $T(\eta) > O \ \forall \eta \in S^{n-2}$.

The symbol $A(\xi)$ depends only on the hermitian parts $\mathfrak{H}A^{jk} := (A^{jk} + (A^{jk})^*)/2$ of the coefficient matrices $A^{jk}$; note that any $A \in \mathcal{M}_N$ can be decomposed as $A = \mathfrak{H}A + i \mathfrak{S}A$ with $\mathfrak{S}A := (A - A^*)/(2i)$ the skew-hermitian part of $A$. Thus the following question is
naturally raised: Can we change the skew-hermitian parts $\mathfrak{S}A^{jk}$ of the coefficients $A^{jk}$ so that $T(\eta) > O$ for all $\eta \in S^{n-2}$ if $A$ is strongly elliptic?

**Theorem 3.3.** Let $A$ be strongly elliptic. Then we can change the coefficients $A^{jk}$ with $A(\xi)$ left unchanged so that $T(\eta) > O$ for all $\eta \in S^{n-2}$ if $n = 2$ or if $N = 1$.

**Inequality (1.4) on $H^1_0(\Omega_1)$.**

**Theorem 3.4.** For inequality (1.4) to hold on $H^1_0(\Omega_1)$ with some constant $c_P > 0$, it is necessary that $A(\xi)$ satisfies the following conditions:

(i) $A(\xi) \geq O \forall \xi \in S^{n-1}$;  
(ii) $A^{nn} > O$;

(iii) For every $\eta \in S^{n-2}$ the matrix polynomial $A(\eta, \tau)$ in $\tau$ has no elementary divisors in the form $(\tau - \alpha)^{2p}$ with $\alpha \in \mathbb{R}$ and $p \geq 2$.

Furthermore, if $n = 2$ or if $N \leq 2$, then it is also sufficient.

**Corollary 3.5.** Assume $n = 2$ or $N = 1$. Let $\Omega$ be an arbitrary bounded domain in $\mathbb{R}^n$. Then, inequality (1.4) holds on $H^1_0(\Omega)$ with some constant $c_P > 0$ if and only if the following conditions are satisfied:

(i) $A(\xi) \geq O \forall \xi \in S^{n-1}$;

(ii)' There is a $\xi_0 \in S^{n-1}$ such that $A(\xi_0) > O$;

(iii)' For some (or any) $\xi_0$ satisfying (ii)' above, if we rotate the coordinate axes so that $\xi_0$ is on the $x_n$-axis, the transformed $A(\xi)$ satisfies condition (iii) in Theorem 3.4.

**Inequalities (1.4) and (1.5) on $\mathfrak{g}H^1(\Omega_1)$.**
Theorem 3.6. For inequality (1.4) to hold on $^0H^1(\Omega_1)$ with some constant $c_P > 0$, it is necessary that $A(\xi)$ and $T(\eta)$ satisfy the following conditions:

(i) – (iii) : as in Theorem 3.4;

(iv) $T(\eta) \geq O \forall \eta \in \mathbb{S}^{n-2}$; (v) $\text{Ker} \, T(\eta) = V_0(\eta) \forall \eta \in \mathbb{S}^{n-2}$.

Furthermore, if $n = 2$ or if $N = 1$, then it is also sufficient.

Theorem 3.7. For inequality (1.5) to hold on $^0H^1(\Omega_1)$ with some constant $c_S > 0$, it is necessary that $A(\xi)$ and $T(\eta)$ satisfy conditions (i)–(iv) as in Theorem 3.6. Furthermore, if $n = 2$ or if $N = 1$, then it is also sufficient.

Corollary 3.8. Assume that $\mathcal{A}$ is strongly elliptic system. Then the following four conditions are equivalent:

(1) Inequality (1.3) holds on the space $H^1(\mathbb{R}_+^n)$ for some constant $c_K > 0$.

(2) Inequality (1.4) holds on the space $^0H^1(\Omega_1)$ for some constant $c_P > 0$.

(3) Inequality (1.5) holds on the space $^0H^1(\Omega_1)$ for some constant $c_S > 0$.

(4) $T(\eta) > O$ for all $\eta \in \mathbb{S}^{n-2}$.

4. Sketchy proofs of Theorems in the case $n = 2$

As mentioned in Introduction, our method is fit for the case $n = 2$ or $N = 1$. Proofs of Theorems of the preceding section in the case $N = 1$ are found in Ito [1]. Here we give those in the case $n = 2$. Now let $n = 2$. Then $\Omega_1 = \mathbb{R} \times (0,1)$ and

$$A(\eta, \tau) = A^{22} \tau^2 + (A^{21} + A^{12}) \eta \tau + A^{11} \eta^2 \quad \text{for } (\eta, \tau) \in \mathbb{R} \times \mathbb{R}.$$
If $A(\xi)$ satisfies conditions (i) and (ii) in Theorem 3.4, the $\Lambda(\eta)$ defined at the beginning of §3 is given by

$$
(4.1) \quad \Lambda(\eta) = \Lambda \eta \quad \text{if} \quad \eta \geq 0, \quad = -\Lambda \eta \quad \text{if} \quad \eta < 0,
$$

where $\Lambda = \lambda(A(1, \tau))$ and $\bar{\Lambda} = \lambda(A(-1, \tau))$. We further set, for simplicity,

$$
V_0 = V_0(A(1, \tau)) = V_0(A(-1, \tau)), \quad V_1 = V_1(A(1, \tau)), \quad \check{V}_1 = V_1(A(-1, \tau)).
$$

In what follows we shall use the notation above.

**Proof of Theorem 3.3.**

Using (4.1) we have

$$
\Lambda(\eta) + \Lambda(-\eta) = (\Lambda + \bar{\Lambda})|\eta|, \quad \Lambda(\eta) - \Lambda(-\eta) = (\Lambda - \bar{\Lambda})\eta.
$$

Thus the $T(\eta)$ defined by (3.1) is calculated as follows:

$$
(4.2) \quad T(\eta) = -i \left( A^{21}\eta + A^{22}\Lambda(\eta) \right)
$$

$$
= (2i)^{-1}A^{22}(\Lambda + \bar{\Lambda})|\eta| - i \left( A^{21} + 2^{-1}A^{22}(\Lambda - \bar{\Lambda}) \right)\eta
$$

$$
= (2i)^{-1}A^{22}(\Lambda + \bar{\Lambda})|\eta| + \left( -\mathcal{S}A^{12} + 2^{-1}\mathcal{S}(A^{22}(\Lambda - \bar{\Lambda})) \right)\eta.
$$

Therefore, if $\mathcal{S}A^{12} = -\mathcal{S}A^{21} = 2^{-1}\mathcal{S}(A^{22}(\Lambda - \bar{\Lambda}))$, then $T(\pm 1) > O$ by Theorem 2.5.

Note that the quadratic form

$$
a[u] = \frac{1}{2} \left\{ (A^{22}(\partial_{x_2} - \Lambda\partial_{x_1})u, (\partial_{x_2} - \Lambda\partial_{x_1})u) + (A^{22}(\partial_{x_2} + \bar{\Lambda}\partial_{x_1})u, (\partial_{x_2} + \bar{\Lambda}\partial_{x_1})u) \right\}
$$

has the property just stated.

**Proof of Theorem 3.4.**

It is easy to see that conditions (i) and (ii) are necessary. So, under (i) and (ii), we show that (iii) is a necessary and sufficient condition. Since

$$
A(\eta, \tau) = (I\tau - \Lambda^*\eta)A^{22}(I\tau - \Lambda\eta) \quad \text{for} \quad (\eta, \tau) \in \mathbb{R} \times \mathbb{R},
$$
we have for every $u \in H_{0}^{1}(\Omega_{1})$, which is regarded as an element of $H^{1}(\mathbb{R}^{2})$ by 0-extension,

$$a[u] = (A(\eta, \tau)\hat{u}(\eta, \tau), \hat{u}(\eta, \tau))_{L^{2}(\mathbb{R}^{2}, \nu)}$$

$$= \left( A^{22}(I\tau - \Lambda\eta)\hat{u}(\eta, \tau), (I\tau - \Lambda\eta)\hat{u}(\eta, \tau) \right)_{L^{2}(\mathbb{R}^{2}, \nu)}$$

$$= \left( A^{22}(\partial_{x_{2}} - \Lambda\partial_{x_{1}})u, (\partial_{x_{2}} - \Lambda\partial_{x_{1}})u \right)_{L^{2}(\mathbb{R}^{2})}$$

$$= \left( R^{*}A^{22}R(\partial_{x_{2}} - J\partial_{x_{1}})R^{-1}u, (\partial_{x_{2}} - J\partial_{x_{1}})R^{-1}u \right)_{L^{2}(\mathbb{R}^{2})},$$

where $J$ and $R$ denote a Jordan form of $\Lambda$ and a corresponding transforming matrix: $J = R^{-1}\Lambda R$, and $\hat{u}(\eta, \tau)$ represents the Fourier transform of $u(x)$. Thus the validity of inequality (1.4) on $H_{0}^{1}(\Omega_{1})$ is equivalent to that of the inequality

$$\|\left(\partial_{x_{2}} - J\partial_{x_{1}}\right)u\|^{2} \geq \tilde{c}_{P}\|u\|^{2} \quad \forall u \in H_{0}^{1}(\Omega_{1})$$

for some $\tilde{c}_{P} > 0$. Moreover the inequality just above is due to the following rough estimates

$$c_{P}(\alpha, p) := \inf\{||\left(\partial_{x_{2}} - J(\alpha, p)\partial_{x_{1}}\right)v||^{2}/||v||^{2}; v \in H_{0}^{1}(\Omega_{1}; \mathbb{C}^{p})\}$$

with $\alpha \in \mathbb{C}$ and $p \in \mathbb{N}$:

$$c_{p}(\alpha, 1) = \pi^{2},$$

$$c_{1}(p) \min\{1, |\text{Im} \alpha|^{2(p-1)}\} \leq c_{p}(\alpha, p) \leq c_{2}(p) \min\{1, |\text{Im} \alpha|^{2(1-\frac{1}{p})}\} \quad \text{if } p \geq 2,$$

where $c_{1}(p)$ and $c_{2}(p)$ are positive constants depending only on $p \geq 2$. We here note that, if $\alpha \in \mathbb{R}$ and $p \geq 2$, for arbitrary nontrivial functions $\phi \in C_{0}^{2}(\mathbb{R})$ and $\psi \in C_{0}^{2}(0,1)$ the family

$$\{w_{\epsilon}\}_{\epsilon > 0} \text{ in } H_{0}^{1}(\Omega_{1}; \mathbb{C}^{p})$$

defined by

$$w_{\epsilon}(x_{1}, x_{2}) = \left( \phi_{\epsilon}'(x_{1} + \alpha x_{2})\psi(x_{2}), \phi_{\epsilon}(x_{1} + \alpha x_{2})\psi'(x_{2}), 0, \ldots, 0 \right)^{T}$$

with $\phi_{\epsilon}(t) = \epsilon^{-1/2}\phi(\epsilon^{-1}t)$ satisfies

$$\frac{\|\left(\partial_{x_{2}} - J(\alpha, p)\partial_{x_{1}}\right)w_{\epsilon}\|^{2}}{\|w_{\epsilon}\|^{2}} \leq \frac{\|\phi_{\epsilon}\|^{2}_{L^{2}(\mathbb{R})}}{\|\phi_{\epsilon}'\|^{2}_{L^{2}(\mathbb{R})}} \cdot \frac{\|\psi''\|_{L^{2}(0,1)}}{\|\psi\|_{L^{2}(0,1)}} \rightarrow 0 \quad \text{as } \epsilon \rightarrow 0.$$

**Proof of Theorem 3.7.**
Since conditions (i) and (ii) are easily checked to be necessary, we show under (i) and (ii) that for inequality (1.5) to hold it is necessary and sufficient that conditions (iii)–(v) are satisfied together.

First, assume that inequality (1.5) is valid. By Proposition 2.3 the boundary-value problem

\[
\begin{cases}
A(\eta, D_t)U(t) = O & \text{for } 0 < t < 1, \\
U(0) = I, & U(1) = O
\end{cases}
\]

with parameter \( \eta \in \mathbb{R} \) admits a unique solution \( U(t) = U(\eta, t) \), which is given by

\[
(4.3) \quad U(\eta, t) = e^{it\Lambda(\eta)} \left\{ I - \left( \int_0^t e^{-is\Lambda(\eta)}(A^{22})^{-1}e^{is\Lambda(\eta)^*} ds \right) \left( \int_0^1 e^{-is\Lambda(\eta)}(A^{22})^{-1}e^{is\Lambda(\eta)} ds \right)^{-1} \right\}.
\]

Note that \( U(\eta, t) \) satisfies

\[
(4.4) \quad \begin{cases}
c_1(1 + |\eta|)^{-1}|r|^2 \leq \int_0^1 |U(\eta, t)r|^2 dt \leq c_2|r|^2, \\
\int_0^1 |\partial_t U(\eta, t)r|^2 dt \leq c_2 (1 + |\eta|)|r|^2 & \forall r \in \mathbb{C}^N, \forall \eta \in \mathbb{R}
\end{cases}
\]

for some positive constants \( c_1 \) and \( c_2 \) independent of \( r \) and \( \eta \). Introducing \( T_0(\eta) := B(\eta, D_t)U(\eta, t)|_{t=0} \), we have

\[
T_0(\eta) = T(\eta) + T_{00}(\eta) \quad \text{with} \quad T_{00}(\eta) = \left( \int_0^1 e^{-is\Lambda(\eta)}(A^{22})^{-1}e^{is\Lambda(\eta)^*} ds \right)^{-1}.
\]

Moreover, for any \( u \in \mathcal{H}^1(\Omega_1) \cap H^2(\Omega_1) \), if we define \( v \in \mathcal{H}^1(\Omega_1) \) by \( \hat{\theta}(\eta, x_2) = U(\eta, x_2)\hat{u}(\eta, 0) \) (see (4.4)), then \( u - v \in H^1_0(\Omega_1) \) and

\[
(4.5) \quad \alpha[v] = \int_{\mathbb{R}} \langle T_0(\eta)\hat{u}(\eta, 0), \hat{u}(\eta, 0) \rangle d\eta,
\]

where \( \hat{\theta}(\eta, x_2) \) denotes the partial Fourier transform of \( \theta(x_1, x_2) \). Simple observation using (4.5) yields that the best constant, denoted by \( c_S \) again, in inequality (1.5) is given by

\[
c_s = \inf_{\eta \in \mathbb{R}} c_s(\eta) \quad \text{with} \quad c_s(\eta) = \text{minimum eigenvalue of } T_0(\eta).
\]
Thus, by assumption, condition (iv) follows from

\[ T(\pm 1) = \lim_{\rho \to \infty} \rho^{-1} T_0(\pm \rho) \geq O, \]

where we have used the fact that \( T_0(\eta) \) is uniformly bounded in \( \eta \) (see (4.6)). Hence, on the subspaces \( \ker T(\pm 1) \) of \( \mathbb{C}^N \), the behaviors of \( T_0(\eta) \) as \( \eta \to \pm \infty \) determine whether \( c_S > 0 \) or \( c_S = 0 \).

Now remind Proposition 2.2 in order to find explicit forms of \( T_0(\pm \infty) = \lim_{\eta \to \pm \infty} T_0(\eta) \), which do exist. Firstly, we write the real elementary divisors of \( A(1, \tau) \) in the form

\[ \{ (\tau - \overline{\beta}_r)(\tau - \beta_r) \}^{q_{\ell m}}, \quad 1 \leq m \leq M_\ell, \ 1 \leq \ell \leq L_1 + L_2, \]

where \( \beta_1, \beta_2, \ldots, \beta_{L_1+L_2} \) are distinct complex numbers such that

\[ \beta_1, \ldots, \beta_{L_1} \in \mathbb{R}, \quad \beta_{L_1+1}, \ldots, \beta_{L_1+L_2} \in \mathbb{C}_+, \]

and \( q_{\ell 1}, q_{\ell 2}, \ldots, q_{\ell M_\ell} \) are positive integers satisfying \( \sum_{\ell=1}^{L_1+L_2} \sum_{m=1}^{M_\ell} q_{\ell m} = N \) and

\[ q_{\ell 1} \geq q_{\ell 2} \geq \cdots \geq q_{\ell M_\ell}, \quad 1 \leq \ell \leq L_1 + L_2. \]

Secondly, using the invertible matrix polynomial \( Q(\tau) \) in the representation (2.2) with \( H(\tau) \) replaced by \( A(1, \tau) \), we define

\[
\begin{cases}
 r_k^{(\ell,m)} = \frac{1}{(k-1)!} Q^{(k-1)}(\beta_\ell) e^{(\ell,m)} \in \mathbb{C}^N & 1 \leq k \leq q_{\ell m}, \\
 R^{(\ell,m)} = \left( r_1^{(\ell,m)} r_2^{(\ell,m)} \cdots r_{q_{\ell m}}^{(\ell,m)} \right) \in \mathcal{M}_{N,q_{\ell m}}, & 1 \leq m \leq M_\ell, \ 1 \leq \ell \leq L_1 + L_2, \\
 R = \left( R^{(1,1)} \cdots R^{(1,M_1)} R^{(2,1)} \cdots R^{(2,M_2)} \cdots R^{(L_1+L_2,1)} \cdots R^{(L_1+L_2,M_{L_1+L_2})} \right) \in \mathcal{M}_N,
\end{cases}
\]

where the unit vectors \( e^{(\ell,m)} \) are chosen in the same way as we chose \( e^{(\ell)} \) in Proposition 2.2. The \( R \) just obtained transforms \( \Lambda \) to its Jordan form:

\[ R^{-1} \Lambda R = \bigoplus_{\ell=1}^{L_1+L_2} \bigoplus_{m=1}^{M_\ell} J(\beta_\ell, q_{\ell m}). \]
Thirdly, corresponding to the form $R$, we write $(R^{-1})^*$ in the form

$$
(R^{-1})^* = \begin{pmatrix} S^{(1,1)} & \ldots & S^{(1,M_1)} & S^{(2,1)} & \ldots & S^{(2,M_2)} & \ldots & S^{(L_1+L_2,1)} & \ldots & S^{(L_1+L_2,M_{L_1+L_2})} \end{pmatrix} \in \mathcal{M}_N,
$$

$$
S^{(\ell,m)} = \begin{pmatrix} s_1^{(\ell,m)} & \ldots & s_{q_{\ell m}}^{(\ell,m)} \end{pmatrix} \in \mathcal{M}_{N,q_{\ell m}}, \quad 1 \leq m \leq M_\ell, \quad 1 \leq \ell \leq L_1+L_2.
$$

Note here that

$$
\sum_{\ell=1}^{L_1+L_2} \sum_{m=1}^{M_\ell} \sum_{k=1}^{q_{\ell m}} r_{k}^{(\ell,m)} \otimes \overline{s_{k}^{(\ell,m)}} = I,
$$

$$
\left( r_{k_1}^{(\ell_1,m_1)}, s_{k_2}^{(\ell_2,m_2)} \right) = \begin{cases} 1 & \text{if } \ell_1 = \ell_2, m_1 = m_2 \text{ and } k_1 = k_2, \\ 0 & \text{otherwise}, \end{cases}
$$

where $a \otimes b \in \mathcal{M}_N$ denotes the tensor product of $a, b \in \mathbb{C}^N$. In these circumstances we obtain

$$(4.6) \quad H_{00}(+\infty) = \lim_{\rho \to \infty} \left( \frac{1}{\rho} \int_0^\rho e^{-it\Lambda} (A^{22})^{-1} e^{itA^*} dt \right)^{-1}$$

$$
= \sum_{\ell=1}^{L_1+L_2} \sum_{m=1}^{M_\ell} \left( \min\{q_{\ell j}, q_{\ell k} \} (2h - 1) c_{h,jk}^{(\ell)} \right) s_{q_{\ell j}}^{(\ell,j)} \otimes \overline{s_{q_{\ell k}}^{(\ell,k)}},
$$

where $c_{h,jk}^{(\ell)}$ is the $(j, k)$-th element of the matrix $\left( \left( S_h^{(\ell)} \right)^* (A^{22})^{-1} S_h^{(\ell)} \right)^{-1} \in \mathcal{M}_{m(\ell,h)}$ with

$$
m(\ell, h) = \max\{m; q_{\ell m} \geq h\}, \quad S_h^{(\ell)} = \begin{pmatrix} s_{q_{\ell 1}}^{(\ell,1)} & \ldots & s_{q_{\ell m(\ell,h)}}^{(\ell,m(\ell,h))} \end{pmatrix} \in \mathcal{M}_{N,m(\ell,h)}.
$$

In addition, for any $\mathbf{r}_1, \mathbf{r}_2 \in V_1$, the function $\langle H_{00}(\eta)\mathbf{r}_1, \mathbf{r}_2 \rangle$ of $\eta$ decays exponentially as $\eta \to +\infty$.

It follows from (4.6) that

$$(4.7) \quad \ker T_{00}(+\infty) = \left( \bigoplus_{\ell=1}^{L_1+L_2} \bigoplus_{m=1}^{M_\ell} S[\mathbf{r}_1^{(\ell,m)}, \mathbf{r}_2^{(\ell,m)}, \ldots, \mathbf{r}_{q_{\ell m}-1}^{(\ell,m)}] + V_1. \right)
$$

Similarly we have

$$(4.8) \quad \ker T_{00}(-\infty) = \left( \bigoplus_{\ell=1}^{L_1+L_2} \bigoplus_{m=1}^{M_\ell} S[\mathbf{r}_1^{(\ell,m)}, \mathbf{r}_2^{(\ell,m)}, \ldots, \mathbf{r}_{q_{\ell m}-1}^{(\ell,m)}] + \check{V}_1. \right)$$
On the other hand, Theorem 2.5 and (4.2) show that

$$T(\eta)|_{V_{0}} = \mathcal{S}(-A^{12} + 2^{-1}A^{22}(\Lambda - \check{\Lambda})) \eta \geq O \quad \forall \eta \in \mathbb{R},$$

from which we can conclude that ker\(T(\pm1) \supset V_{0}\). Now suppose that there is an index \(\ell\) such that \(1 \leq \ell \leq L_{1}\) and \(q_{\ell} \geq 2\). Then we have by (4.7) and (4.8)

$$\langle T_{0}(\eta)r_{\ell,1}^{(\ell,1)}, r_{\ell,1}^{(\ell,1)} \rangle = \langle T_{00}(\eta)r_{\ell,1}^{(\ell,1)}, r_{\ell,1}^{(\ell,1)} \rangle \to 0 \quad \text{as} \quad \eta \to \pm \infty,$$

which is a contradiction. Thus condition (iii) is satisfied. Suppose again that ker\(T(1) \neq V_{0}\). Then there is a nontrivial \(r \in V_{1}\) such that \(T(1)r = 0\), which satisfies

$$\langle T_{0}(\eta)r, r \rangle = \langle T_{00}(\eta)r, r \rangle \to 0 \quad \text{as} \quad \eta \to +\infty.$$

Since this contradict the positivity of \(c_{s}\), we have ker\(T(1) = V_{0}\). Likewise we can show that ker\(T(-1) = V_{0}\). Hence, we lastly obtain condition (v).

We proceed to the sufficiency part. Under condition (iii), (4.6) and the corresponding representation for \(T_{00}(-\infty)\) show that \(T_{00}(\pm\infty)|_{V_{0}} > O\). Hence, using conditions (iv) and (v) we can deduce that

$$T_{0}(\eta) \geq c_{3}I \quad \forall \eta \in \mathbb{R}$$

for some constant \(c_{3} > 0\) independent of \(\eta\).

**Proof of Theorem 3.6.**

Since conditions (i)–(iii) are necessary by Theorem 3.4, assuming those to be satisfied we show that inequality (1.4) is valid on the space \(0^{1}H^{1}(\Omega_{1})\) if and only if conditions (iv) and (v) hold.

We begin with the necessity part. For any \(\phi \in H^{1}(\mathbb{R})\), define \(v \in 0^{1}H^{1}(\Omega_{1})\) by \(\hat{v}(\eta, x_{2}) = U(\eta, x_{2})\hat{\phi}(\eta)\), where \(U(\eta, t)\) is as in (4.3). Then inequality (1.4) on \(0^{1}H^{1}(\Omega_{1})\) yields, by (4.5)
and the arbitrariness of $\phi$, that

\begin{equation}
(T_0(\eta)r, r) \geq c_{P2} \int_0^1 |U(\eta, t)r|^2 dt \quad \forall r \in \mathbb{C}^N, \forall \eta \in \mathbb{R}.
\end{equation}

This implies that $T_0(\eta) \geq O$ for all $\eta \in \mathbb{R}$, so that $T(\pm 1) \supset V_0$. Now suppose that there exists a nonzero $r_1 \in \ker T(1) \cap V_1$. Since, from what stated just below (4.6), we have

$\langle \eta T_0(\eta)r_1, r_1 \rangle = \langle \eta T_{00}(\eta)r_1, r_1 \rangle \to 0$ as $\eta \to +\infty$,

so by (4.9) that $\eta \int_0^1 |U(\eta, t)r_1|^2 dt \to 0$ as $\eta \to +\infty$. This contradicts (4.4), so $\ker T(1) = V_0$. Likewise $\ker T(1) = V_0$ is obtained. Therefore condition (v) holds.

Conversely, let (iv) and (v) be satisfied. Given $u \in \mathcal{V}^1(\Omega_1) \cap \mathcal{H}^2(\Omega_1)$ we write $\phi(x_1) = u(x_1, 0) \in \mathcal{H}^1(\mathbb{R})$ and define $v \in \mathcal{V}^1(\Omega_1)$ as above. Using (4.4) we have

$$
\|v\|^2 = \int_{\mathbb{R}} d\eta \int_0^1 |U(\eta, t)\hat{\phi}(\eta)|^2 dt \leq c_2 \|\phi\|^2.
$$

Since $u - v \in \mathcal{H}^1_0(\Omega_1)$, Theorems 3.4 and 3.7 yield that

$$
a[u] = a[u - v] + a[v] \geq c_{P1}\|u - v\|^2 + c_sc_2^{-1}\|v\|^2 \geq \frac{c_{P1}c_S}{c_2c_{P1} + c_S}\|u\|^2,
$$

where $c_{P1}$ denotes the best constant in inequality (1.4) on $\mathcal{H}^1_0(\Omega_1)$. This completes the proof.

5. Examples

**Example 1.** Consider the quadratic form (1.8). This determines the symbols

$$
A(\xi) = \sum_{j,k=1}^{n} A^{jk} \xi_j \xi_k, \quad B(\xi) = -i \sum_{k=1}^{n} A^{nk} \xi_k
$$

for $\xi \in \mathbb{R}^n$.

Conditions (i) and (ii) in §3 hold if and only if

$$
A^{nn} > 0 \quad \text{and} \quad A^{nn} \sum_{j,k=1}^{n-1} A^{jk} \eta_j \eta_k \geq \left( \sum_{j=1}^{n-1} A^{nj} \eta_j \right)^2 \forall \eta \in S^{n-2}.
$$

Let (5.1) be satisfied. Then condition (iii) always holds. The $\Lambda(\eta)$ and $T(\eta)$, defined at the beginning of §3, are given by

$$\Lambda(\eta) = (A^{nn})^{-1} \left\{ i \left[ \sum_{j,k=1}^{n-1} A^{jk} \eta_j \eta_k - \left( \text{Re} \sum_{j=1}^{n-1} A^{nj} \eta_j \right) - \text{Re} \sum_{j=1}^{n-1} A^{nj} \eta_j \right] \right\},$$

$$T(\eta) = \sqrt{A^{nn} \sum_{j,k=1}^{n-1} A^{jk} \eta_j \eta_k - \left( \text{Re} \sum_{j=1}^{n-1} A^{nj} \eta_j \right)^2 + \text{Im} \sum_{j=1}^{n-1} A^{nj} \eta_j} \quad \text{for } \eta \in \mathbb{R}^{n-1}.$$  

Thus conditions (iv) and (v) are satisfied if and only if

$$A^{nn} \sum_{j,k=1}^{n-1} A^{jk} \eta_j \eta_k \geq \left| \sum_{j=1}^{n-1} A^{nj} \eta_j \right|^2 \quad \forall \eta \in S^{n-2}$$

with the equality attained only by $\eta$ satisfying $\text{Im} \sum_{j=1}^{n-1} A^{nj} \eta_j = 0$. If all the coefficients $A^{jk}$ are real in particular, then conditions (iv) and (v) follows directly from (5.1).

**Example 2.** The quadratic form (1.9) determines the symbols

$$A(\xi) = (\lambda + \mu) \xi \otimes \xi + \mu |\xi|^2 I,$$

$$B(\xi) = -i(\lambda e_n \otimes \xi + \mu \xi \otimes e_n + \xi \otimes e_n) \quad \text{for } \xi \in \mathbb{R}^n,$$

where $e_n = (0, \ldots, 0, 1)^T$. Condition (i) in §3 is equivalent that

(5.2) \hspace{1cm} \mu > 0 \quad \text{and} \quad \lambda + 2\mu > 0.

Let (5.2) be satisfied. Then conditions (ii) and (iii) are satisfied. The real elementary divisors of the matrix polynomial $A(\eta, \tau)$ in $\tau$ with parameter $\tau \in \mathbb{R}^{n-1}$ are given by

$$\sqrt{\tau^2 + |\eta|^2, \ldots, \tau^2 + |\eta|^2}$$ \hspace{1cm} \text{if } \lambda + \mu \neq 0 \text{ and } \eta \neq 0;

$$\sqrt{\tau^2 + |\eta|^2, \ldots, \tau^2 + |\eta|^2}$$ \hspace{1cm} \text{if } \lambda + \mu = 0 \text{ or } \eta = 0.$$
Moreover, the $\Lambda(\eta)$ and $T(\eta)$ are given by

$$
\Lambda(\eta) = \begin{pmatrix}
i \left( I_{n-1} |\eta| + \beta \frac{\eta \otimes \eta}{|\eta|} \right) & -\beta \eta \\
-\beta \eta^T & i(1 - \beta) |\eta|
\end{pmatrix},$

$$
T(\eta) = \mu \begin{pmatrix}
I_{n-1} |\eta| + \beta \frac{\eta \otimes \eta}{|\eta|} & -i(1 - \beta) \eta \\
i(1 - \beta) \eta^T & (1 + \beta) |\eta|
\end{pmatrix}
$$

for $\eta \in \mathbb{R}^{n-1},$

where $\beta = (\lambda + \mu)/(\lambda + 3\mu)$; the eigenvalues of $T(\eta)$ are

$$2\mu |\eta|, 2\beta \mu |\eta|, \mu |\eta|, \ldots, \mu |\eta|.$$ 

Since $V_0(\eta) = \{0\}$ for all $\eta \in S^{n-2}$, conditions (i)-(v) hold together if and only if

$$\mu > 0 \quad \text{and} \quad \lambda + \mu > 0.$$

We finally note that Corollary 3.8 is applicable to this case under (5.2).
