Phonemic Sketch of Dohoi/Kadorih

(Austronesian: Upper Reaches of Kahayan River in Kalimantan, Indonesia)

Kazuya INAGAKI

This paper provides a description and analysis of the Dohoi/Kadorih sound system which has been depicted only superficially so far (Santoso et al. 1984). First, in §2.1, rules for fronting, prenasalization, and nonrelease will be postulated to explain general allophones. Then, exhibiting (sub-)minimal pairs in several environments, procedures of determining phonemes and allophones (supported by acoustic correlates) follow. Consonant and vowel phonemes will be posited in §2.2—§2.6 and §3 respectively. At the same time, derivations for each allophonic realization will be specified. Distributional deviations of each context-sensitive allophone tell us which segment does not have full status as a phoneme: l; y; β; d, n; e. Diphthong is confirmed by three conditions that define diphthong status, described in §3.2.

Key words: fronting rule, prenasalization rule, nonrelease rule, acoustic correlates, conditions for a diphthong

1 Introduction

1.1 Mapping

This paper deals with an Austronesian language, Dohoi/Kadorih. §1.2 determines how the language name “Dohoi/Kadorih” is used in this paper.

Meyers et al. (2003) is the only literature that documents populations of language communities for each village along the Seruyan river. This survey remarks that speakers of “Sebaun (Dohoi)” reside around the Seruyan-East tributary (Rantau Panjang, Mongohjouoi), and around the Seruyan tributary (Tusuk Belawan, T.(Tumbang) Kalam, T. Bahan, and T. Kasai).

Table 1 summarizes the details about Language Names and demographic information of Meyers et al. (2003), Inagaki (2005), Santoso et al. (1984), Hudson (1967), and

Table 1  Language Names, demographic information, and Researchers (T. = Tumbang)
Loing (1916–17, in Stokhof 1986: 3–16). If it is true that all language names in Table 1 refer to (certain dialects of) a single language, then the whole upstream region which includes Seruyan-Katingan-Kahayan-Kapuas (from west to east) can be recognized as the area of this single language.

1.2 Language name: Dohoi/Kadorih

People residing in the upstream region of Kahayan refer to their mother tongue by phrases bahasa Dohoi, bahasa Ot Danum, bahasa Kadorih, when speaking Indonesian. Santoso et al. (1984) surveyed in Tumbang Marikoi in which Inagaki (2005) surveyed, but only used the word “Ot Danum” rather than “Dohoi” or “Kadorih”.

“Ot Danum” (Mallinckrodt 1928, Cense and Uhlenbeck 1958, Santoso et al. 1984), and “Dohoi” (Hudson 1967, Wurm and Hattori 1981–83) have been referred to in much of the literatures. Hudson states that “Ot Danum” is an ambiguous term since:

1. a. it doesn’t have a precise ethnic referent
   b. it had an original pejorative connotation (like “Dayak”)  
   c. it isn’t used by any group to refer to itself (Hudson 1967: 7)

“Sebaun” is a name of the language which is spoken in the upper Seruyan river. Some of the speakers recognize their language as same as “Dohoi” (Meyers et al. 2003: 11). In this paper, “Sebaun” is counted out because it is impossible to know what this language is (there is no linguistic data available).

Gordon (2005) refers to alternative names other than “Dohoi” for languages such as “Uut Danum, Uud Danum, Malahoi” and for dialects such as “Ulu Ai’ (Da’an), Ot Balawan, Ot Banu’u, Kadorih, Ot Olang, Ot Tuhup, Sarawai (Melawi), Sebaung”. In this list, “Kadorih” and “Sebaung” (probably identical with “Sebaun” in Meyers et al. 2003) are found to be dialects of “Dohoi”, but again no linguistic data of these languages/dialects can be reviewed.

For the language name in this paper, some basic criteria are used. First, the name by which most of the people residing in the upstream region of Kahayan easily identify the referent, i.e., Dohoi, Ot Danum, Kadorih. 1 Second, the name by which researchers identify the referent without any difficulty. As noted above, “Dohoi” and “Ot Danum” have been used in several studies. Third, Hudson’s statement (1a) and (1b) must be considered. For (1a), ot danum ‘source + water’ is recognized as a phrase that has a certain kind of LOCATION property, thus the referent of this phrase is regarded as a

---

1 Hudson (1967: 7) rejects the name “Ot Danum” because it is “not used by any group” [see (1c)]. However his statement is exaggerated by the word “any”. Thus, at this stage the identifiability of the name “Ot Danum” can be reinforced.
geographical one, not as an ethnic one. For (1b), the element *ot* is associated with another lexical item *uut* ‘primitive, outdated’ that has contemptuous implications, so *bahasa Ot Danum* and *orang Ot Danum* are not preferred.

“Dohoi” is selected as the language name since it does not violate any basic criteria given above, whereas “Ot Danum” and “Kadorih” do. In addition, “Ot Danum” violates the last two criteria, while “Kadorih” that is specialized to refer to the dialect only violates the second criterion. Thus, it may be appropriate to use the name “Kadorih” for a dialect of “Dohoi” (Dohoi/Kadorih).

### 1.3 A classification of “Barito isolects” in Hudson (1967)

Hudson (1967) classified languages in Southern Kalimantan based on “contrastive sound correspondences” and lexicostatistics. Figure 2 shows a classification of “Barito isolects” and Hudson’s sound correspondences.

![Figure 2 A classification of Barito languages](with some modification to Hudson 1967: 26)

Hudson’s pioneering classification, however, cannot incorporate some of the exceptions that are inconsistent with his “sound correspondences”. For example, there are...
\(k/\ell, T/NT\) correspondeces in [Dohoi, Murung-1]/[Murung-2, Siang] which are similar to the ones between KB and Katingan \((k/\ell, NT/T)\). But the exceptions are seen with the initial \(k\) of Murung-2 as in (2a’) and with the medial \(NT\) of Murung-1 as in (2b’).

2 Consonants

Dohoi/Kadorih has eighteen consonant phonemes as in Table 2.

In this section, Dohoi/Kadorih contrastive consonants in three environments (string-initial/intervocalic/string-final) \(^2\) are explored, and phonetic forms are manifested by means of the formalization of generative phonology.

\(^2\) In this paper, the term string is employed to state the allophonic environments ('[ '='left edge, ']' '='right edge) rather than “word” since string by itself can be referred in terms of purely phonetic/phonological ground, “word” cannot on the other.

This paper does not consider consonant sequence CC entirely at the string-medial position, which is not common to all consonants.

Table 2  Dohoi/Kadorih consonant phonemes (vl. = voiceless; vd. = voiced)

When no minimal pair is known for the relevant segments, a sub-minimal pair is exhibited (marked by #). In addition, each consonant is examined on status as a phoneme from the viewpoint of its distribution.

Santoso et al. (1984) set up seventeen consonant phonemes (i.e., /p, b, t, d, c, j, k, g, s, h, m, n, ŋ, η, r, r, w/: there is no /y/ in the inventory). They postulate “/R/” as an archiphoneme / (r/1)/, even though “phoneme /1/ is not found in Ot Danum” (ibid.: 10). By definition, CONTRAST of (at least) two phonemes must be presupposed for explanation of NEUTRALIZATION, which is again presupposed for ARCHIPHONEME. But their discussion does not presuppose CONTRAST between “/r/” and “/1/”, so NEUTRALIZATION cannot be seen with these segments. In fact, (sub-)minimal pairs in (18, 19, 20) below clearly demonstrate the contrast between /r/ and “/R/” (/r/), and the lack of neutralization with these phonemes. *3

Some atypical and highly specific phonetic symbols will be used: (i) CORNER + SUPERSCRIPT L (\textsuperscript{L}) (‘fragile’ occlusion of stops, namely no prominent release and laterally leaking airflow. see the discussion in § 2.1.3); (ii) CURLY TAIL T/D/N (\textsuperscript{T}, \textsuperscript{D}, \textsuperscript{N}) (plosives and nasal with alveolo-palatal fricatives [ζ, ζ] in terms of the articulatory target positions); (iii) SUBSCRIPT DOT (\textsuperscript{.}) (slightly retroflexed alveolar consonants. See Ladefoged and Maddieson (1996:25–27) on “two degrees of retroflexion”); (iv) SUBSCRIPT W (\textsuperscript{W}) (simple labialization without raising of the back of the tongue. See Ladefoged and Maddieson 1996: 356–58).

*3 One possible explanation would be that Santoso et al. (1984) analyzed the suspensive allophones of “/R/” in the context of Indonesian phonemic contrast (/r:1/). If so, however, this archiphonemic analysis must be rejected because the term ARCHIPHONEME can never be associated with a bizarre neutralization found outside the relevant phonemic system.
2.1 Allophones and its relevant rules

Most of allophones derived from the consonant phonemes in Dohoi/Kadorih can be explained using three rules in (4: vd. = voiced, vl. = voiceless).

(4) a. fronting rule: fronted place of articulation, § 2.1.1, (7)
   b. prenasalization rule: predictive velic opening of vd. plosives, § 2.1.2, (10)
   c. nonrelease rule: unaudible releases of vl. plosives, § 2.1.3, (12)

2.1.1 Fronting rule

Alveolar and alveopalatal consonants have a series of allophones before or after close front unrounded vowel. More specifically,  

- t, d, n, r, r; c, j, s, s that occur in the environment _ (D) i or i _ ] are different from those that occur elsewhere. These i-adjacent allophones can be described as common in the sense of laminal phones (place of articulation: denti-alveolar; [ ]).

(5) Alveolar/alveopalatal allophones conditioned by adjacent vowels

- [t]: tiruh [tiruh], arit [erit] ‘to sleep’, ‘sickle’
- [t]: taca, tuyo, terik, toru ‘bush’, ‘louse’, ‘strong sunshine’, ‘three’
- [n]: dina [dina] ‘above’
- [n]: doni [doni], ohcin [ohci:n] ‘nearby’, ‘fish’
- [n]: naka, nupi, noku ‘blood’, ‘thorn’, ‘cannon’, ‘nearby’
- [n]: ri [siu], miikir [mixki] ‘afraid, anxious’, ‘to deceive’
- [r]: rami, ruha, renge, rondo ‘thronged’, ‘concussion’, ‘to be set’, ‘Be careful!’
- [x]: rimo [rimo] ‘five’
- [x]: cagu, ruku, rehki, roh ‘song’, ‘worm’, ‘price’, ‘snake’
- [nd]: tandit [tendit] ‘proverb’
- [nd]: pinda, tondu, pande, endo ‘below’, ‘horn’, ‘to say’, ‘theirs’
- [t]: cikar [iker] ‘fully loaded’
- [t]: cafet, eruk, cehpok, cokuru ‘underpants’, ‘small torch’, ‘rubber’, ‘funnel’
- [t]: jipon [jipon] ‘slave’
- [t]: jas, jatap, jere, jora ‘eight’, ‘pot’, ‘light (lamp)’, ‘tongue’
- [s]: sita [sita], karis [keri] ‘to love’, ‘kris’
- [s]: sak, suna, seta, sohu ‘saucer’, ‘onion’, ‘seats (in a boat)’, ‘anchor’
- [s]: nihpo [nipo] ‘tooth’
- [s]: nadap, nuhu, nokok ‘sap’, ‘to order, command’, ‘to cough’
Phonemic Sketch of Dohoi/Kadorih

On the other hand, each velar consonant also has i-adjacent allophones, but unlike alveolar and alveopalatal consonants, they are characterized by *advanced place of articulation* ([k], [ŋ]), not by laminality.

(6) Velar allophones conditioned by adjacent vowels

[k]: kiru [kiru], koik [koik]  ‘a pair of scales’, ‘small’
[k]: kacu, kuca, keter, kotut  ‘wood’, ‘thousand’, ‘cooking pot’, ‘fart’
[ŋ]: ginigini [giniŋ, ginin]  ‘inclination to make a hole in something silky smooth’
[ŋ]: gambuh, gugugoga, gehta, golembuy  ‘bouce’, ‘to stammer’,
[ŋ]: ŋita [ŋini], ɔtiti [ɔgiŋ]  ‘to dance’, ‘honey’
[ŋ]: ŋaat, ŋuhta, ŋomo  ‘bat’, ‘to vomit’, ‘to feel’

If allophones in (5) and (6) are transcribed more broadly, then, “fronted” (or “advanced”) is abstracted as a common feature within these allophones. Based on this manner of transcription, the allophonic rule in (7) can be postulated concerning the noticeable realization of “frontedness”.

(7) Fronting rule  

(applied to /t, d, n, r, l, j, s, n, k, g, ŋ/ in __ (D) i or i __)

\[ [+ \text{ cons} ] - [ + \text{ fronted}] / _{-} (\begin{pmatrix} [+ \text{ cons} ] \\ - \text{ son} \\ - \text{ cont} \\ + \text{ voi} \end{pmatrix}) [ - \text{ cons} ] \begin{pmatrix} [+ \text{ high} ] \\ - \text{ back} \end{pmatrix} \text{ or } \begin{pmatrix} - \text{ cons} \\ + \text{ high} \end{pmatrix} _{-} \]

Note that each of the broader phonetic representations derived by the rule (7) corresponds to the narrower phonetic transcriptions, LAMINAL (5: [ ], alveolar and alveopatal consonants) on the one hand and ADVANCED PLACE OF ARTICULATION (6: [ + ]; velar consonants) on the other.

*4 The feature [ fronted ] is neither general nor formal in generative phonology.

Feature specifications of phonemes in this paper can be assumed as follows.

|        | p | b | b | m | t | d | n | r | t | c | j | s | ʃ | s | k | ɡ | ŋ | h | y | i | u | e | ə | o | a |
| consonantal | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + | + |
| sonorant | _ | _ | _ | + | + | + | + | + | + | + | + | + | + | + | + | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| continuant | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| nasal | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| lateral | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| voice | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| labial | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| coronal | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| anterior | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| distributed | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| dorsal | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| high | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| low | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| back | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
2.1.2 Prenasalization rule
There are homorganic prenasalizations of voiced plosives ([N\text{D}]) whose first portion is differentiated from the nasal segment in the sequence [ND] (which appears only in the middle position) in terms of quantity and quality.

(8) \[ \text{[N\text{D}]} : \text{[ND]} \]

\begin{align*}
\text{[m\text{beu}]} : \text{[pem\text{beu}]} & \quad \text{‘mouth’ : ‘window’} \\
\text{[p\text{duhu}]} : \text{[en\text{do}]} & \quad \text{‘blood’ : ‘theirs’} \\
\text{[\text{d}*\text{ru}]} : \text{[run\text{d}*\text{u}]} & \quad \text{‘eight’ : ‘lance’} \\
\text{[g\text{u}]} : \text{[c\text{u}]} & \quad \text{‘omen’ : ‘Solanum tarvum’}
\end{align*}

This articulatory and auditory observation is supported by an acoustic phonetic evidence.

Figure 3 shows the spectrograms of \text{[m\text{beu}]} ‘mouth’ and \text{[pem\text{beu}]} ‘window’. Both of these words were uttered in almost the same duration, about 600ms. Additionally, \text{[m\text{beu}]} consists of a smaller number of segments than \text{[pem\text{beu}]} Therefore, \text{[m\text{beu}]} was produced at a slower speech rate than \text{[pem\text{beu}]} Despite its slower speech rate, \text{[m]} has a shorter duration (115ms) as a nasal segment than \text{[m]} does (170ms).

Furthermore, it is confirmed that the nasal portion of \text{[m\text{beu}]} is weaker than that of \text{[pem\text{beu}]} when the values of amplitude are considered concerning each of the formant poles in Figure 4.

Figure 4 shows spectra of \text{[m]} in \text{[m\text{beu}]} and \text{[m]} in \text{[pem\text{beu}]} the former is ‘sliced’ at 5.4 second-point, the latter at 16.7 second-point, in each form shown in Figure 3 The values of amplitude in each resonance of \text{[m]} are lower than those of \text{[m]} This means that \text{[m]} has a lower quality as a bilabial nasal consonant than \text{[m]}. 

---

Kazuya INAGAKI
In Dohoi/Kadorih, the prenasalization is observed both at the string-initial and string-medial positions, and some of the pairs contrast a prenasalized consonant and a sequence of two homorganic consonants as in (9). However, a prenasalized consonant \([ND]\) and a non-prenasalized one \([D]\) never contrast.

\[(9)\] String-medial (only) — 
\[
\begin{array}{c}
\text{/b/} \quad \text{mb} \quad \text{b – mb} \\
\text{/d/} \quad \text{nd} \quad \text{d – nd} \\
\text{/g/} \quad \text{ng} \quad \text{g – ng}
\end{array}
\]

\([/b/ \rightarrow /mb/, /d/ \rightarrow /nd/, /g/ \rightarrow /ng/\] The nasal portions of these strings are also different from each other in terms of their quantity and quality.

In the case of the prenasalization in Dohoi/Kadorih, the velum maintains intermediate positions (i.e., not fully closed or lowered) in which airflow leaks through the velar port. As a result, only a slight nasal leaking is audible. Such prenasalization can be considered to be a phonetic device to support voicing in the allophones of voiced plosive/affricate since there is no contrast between prenasalized allophone \([ND]\) and its non-prenasalized counterpart \([D]\).*5

Considering the property of supporting voicing as just mentioned, the allophonic rule in (10) can be postulated concerning the noticeable realization of the nasality.

---

*5 Ohala (1983: 200) points out the fact that some languages utilize prenasalization to maintain voicing contrast on a stop consonant.
(10) **Prenasalization rule**  
(applied to string-initial or intervocalic /b, d, j, g/)  

\[
\begin{align*}
[+ \text{cons}] & \rightarrow [+\text{prenasal}] / ([−\text{nas}]) \quad \text{for} /b/ \rightarrow [m_b] \\
[− \text{son}] & \rightarrow \quad \text{for} /d/ \rightarrow [n_d] \\
[− \text{cont}] & \rightarrow \quad \text{for} /j/ \rightarrow [n_f] \\
[+ \text{voi}] & \rightarrow \quad \text{for} /g/ \rightarrow [n_g]
\end{align*}
\]

Note that no [-NND-] has been detected. Therefore, the prenasalization rule (10) is stipulated to be inactive against the postnasal /D/, which is already preceded by nasal segment /N/, in other words, ‘already prenasalized’. To put it more technically, (10) does not alter /D/ to [-NND-] in the context ‘[+nas] _’, and does elsewhere.

2.1.3 **Nonrelease rule**

There are string-final voiceless plosives that have a property “no audible release”. The voiceless plosives are only released in the string-initial/medial positions. For example:

As shown in (11), string-initial and intervocalic *p, t, k* must be released, while string-final ones cannot be released. The airflow for articulating *p, t, k* must be unreleased and stopped at each place of articulation in the case of string-final plosives. Thus, the allophonic rule in (12) can be postulated concerning the noticeable “no audible release”.

(12) **Nonrelease rule**  
(applied to string-final /p, t, c, k/)  

\[
\begin{align*}
[+ \text{cons}] & \rightarrow [+\text{nonrelease}] / _/ \quad \text{for} /p/ \rightarrow [p'] \\
[− \text{son}] & \rightarrow \quad \text{for} /t/ \rightarrow [t', t^*] \\
[− \text{cont}] & \rightarrow \quad \text{for} /c/ \rightarrow [k', k^*] \\
[− \text{voi}] & \rightarrow \quad \text{for} /k/ \rightarrow [k']
\end{align*}
\]

It should be noted that phonetic forms of string-final *t* varies depending on their preceding vowels. For example:

(13) *ucat* [ux'et] ‘neck’  
*aliut* [arut'] ‘canoe’  
*sapet* [kapet'] ‘to see one’s way to’  
*usot* [usot'] ‘mucus’

**8** The feature [prenasal] is neither general nor formal in generative phonology.  
**9** The feature [nonrelease] is neither general nor formal in generative phonology.  
**8** This rule application is included in the scope of rule (12), but the occurrence of string-final /c/ is not allowed by Dohoi/Kadorih phonotactics, therefore [k^*] never occurs.

— 25 —
When a vowel other than \( i \) precedes \( t \), the airflow is incompletely obstructed at the alveolar ridge and leaks from the narrow aperture between the palate and the side of the tongue since such \( t \) is articulated as apical phone with slight retroflexion (\([\mathbf{i}]\)). On the contrary, when \( i \) precedes \( t \), the airflow is completely obstructed by the laminal \([\mathbf{i}]\) that occludes airflow’s path more extensively than apical \([\mathbf{t}]\) does.

Allophonic realizations are not affected by rule ordering, either (7 then 10 then 12), (12 then 10 then 7) etc. since these rules neither feed nor bleed each other. But if the lateral leaking noted above is taken into account, and a certain kind of rule formalization (e.g. dependency on laminality) is posited, then rule ordering will need to be considered. In this paper, conditions for the realization of \([\mathbf{t}^3] \) are described as in (14).

(14) **Conditions for the realization of \([\mathbf{t}^3] \)**
   
a. /t/ at the string-final position
b. /t/ preceded by a vowel other than /i/

### 2.2 Bilabial consonants

There are only three items which have initial /\( \beta \)/, \( \beta \)ayah (\( \beta \)uh) ‘now’, \( \beta \)arisan ‘to inherit’, \( \beta \)adai ‘cake, snack’. But all of these are borrowed items from Ngaju wayah, \( \beta \)adai, and Indonesian warisan. On the other hand, /\( \beta \)/ is widely distributed at the intervocalic position as in (16).

(15) **String-initial** — p, b, m, \( \beta \)/[

| /p/ | : /b/ | putu | buku | [putu] : [\( \beta \)b\( u\)ku], ‘ten’ : ‘body hair’ |
| /m/ | : /\( m \)/ | mira | mira | [m\( i\)ra] : [m\( i\)ra], ‘how many’ : ‘when’ |
| /\( t \)/ | /\( t \)/ | pahi | tah | [p\( \mathbf{h} \)i] : [t\( \mathbf{h} \)], ‘ray’ : ‘long (time)’ |

| /\( b \)/ | /\( m \)/ | bohit | mohit | [\( \beta \)bohit\( \beta \)] : [mohit\( \beta \)], ‘scabies’ : ‘salty’ |
| /\( d \)/ | /\( d \)/ | baha | daha | [\( \beta \)b\( a\)h\( a \)] : [\( \beta \)d\( a\)h\( a \)], ‘tumor’ : ‘blood’ |

(16) **Intervocalic** — p, b, m, \( \beta \)/V \( \_ \)V

| /p/ | : /b/ | tapih | tabit | [t\( \mathbf{p} \)i\( \mathbf{h} \)] : [\( \mathbf{t} \)\( \mathbf{b} \)\( i\)t\( \mathbf{h} \)], ‘sarong’ : ‘spiritual counselor’ |
| /\( m \)/ | : /\( m \)/ | \( \gamma \)opi | \( \gamma \)omi | [\( \gamma \)opi] : [\( \gamma \)omi], ‘to hit (child discipline)’ : ‘to smile’ |

Table 3 Bilabial consonants and the relevant rules
(els. = elsewhere, vl. = voiceless, vd. = voiced)

### 2.3 Alveolar consonants

In the environment [ — i (the string-initial position followed by i), t, r and r can occur freely, but occurrences of d and n are restricted (only three items: dikdikaj ‘to hop’; diaj ‘upper, above’; dindiq ‘wall’).

(18) **String-initial** — t, d, n, r, r / __

/t/ : /d/ turaj duraj [turaj] : ["duraj], ‘bone’:
  ‘wok’

/ʈ/ : /n/ tapa napa [typa] : [napa], ‘cheek (outside)’:
  ‘to make, do’

/ʃ/ : /tʃ/ tiŋaj riŋan [tiŋan] : [riŋan], ‘hornbill’:
  ‘wound’

/ʃ/ : /ʃ/ toʃu roʃu [toʃu] : [roʃu], ‘sugarcane’:
  ‘village’

/ʃ/ : /ʃ/ tapa capat [typa] : [ʃepat"], ‘cheek (outside)’:
  ‘fast’
Phonemic Sketch of Dohoi/Kadorih

/d/ : /h/  
dujo  nujo  [°dujo] : [nujo], ‘to sit (relaxed)’ : ‘to nod’

/t/ : /t/  
duhi  ruha  [°duhi] : [ruha], ‘thorn’ : ‘shaking’

/dogon  rogan  [°dogon] : [rogon], ‘companion’ : ‘attic’

/r/ : /r/  
duraj  juraj  [°duraj] : [°duraj], ‘wok’ : ‘pot’

/n/ : /l/  
lataj  ratag  [°lataj] : [°ratag], ‘to weave’ : ‘basket’

/rafi  rofag  [rafag] : [rofag], ‘to cut down’ : ‘grave’

/r/ : /n/  
nondu  nondu  [nondu] : [nondu], ‘to crow (cock)’ : ‘to hiccup’

/t/ : /l/  
ragu  ragg  [ragg] : [ragg], ‘worried, anxious’ : ‘song’

/r/ : /y/  
rataj  rakyat  [rataj] : [jukat’], ‘necklace’ : ‘Get in!’

/t/ : /y/  
rakep  yakt  [rakep] : [jukat’], ‘trap’ : ‘Get in!’

(19) Intervocalic  —  t, d, n, r, r / V  _ V

/t/ : /d/  
ratij  ratij  [ratij] : [re³tij], ‘raft’ : ‘knife’

/n/ : /n/  
ataj  anan  [atan] : [anan], ‘birds of prey’ : ‘there’

/t/ : /m/  
metroj  moroj  [metroj] : [metroj], ‘to make a knot’ : ‘straight’

/r/ : /o/  
oo  oro  [oto] : [oro], ‘ghost’ : ‘although’

/t/ : /u/  
utej  ucat  [utej] : [utej], ‘debt’ : ‘deer’

/d/ : /n/  
radoj  rann  [rann] : [ran], ‘dagger’ : ‘awake’

/t/ : /d/  
trudoj  trudoj  [nu³duk] : [nu³ruk], ‘to cut, slash’ : ‘flood’

/an/ : /a/  
padaj  paraj  [pe³daj] : [pe³r], ‘metal waistband’ : ‘most’

/j/ : /k/  
kadaraj  kajaraj  [ke³dærj] : [ke³dærj], ‘thin, meager’ : ‘swallow’

/n/ : /z/  
jonih  zorih  [jonix] : [jorix], ‘to hear’ : ‘to drink’

/t/ : /k/  

/h/ : /n/  
ponej  ponaj  [ponen] : [ponen], ‘hand + forearm’ : ‘small accessory’

/r/ : /l/  
marom  morom  [merom] : [merom], ‘brown’ : ‘yesterday’

/y/ : /i/  
iroh  iyo  [iro] : [i], ‘they’ : ‘then’

/t/ : /y/  
baras  bayar  [°baræg] : [°beæ], ‘formative (numerals)’ : ‘to pay’

Of the five alveolar consonants /t, d, n, r, r/, /t/, /n/, /r/ and /r/ can occur at the string-final position, only /d/ cannot occur.

(20) String-final  —  t, n, r, r / _ _ }

/t/ : /h/  
ucan  ucan  [°utæ] : [utæ], ‘neck’ : ‘rain’

/t/ : /t/  
capar  capar  [°tæpæ] : [tæpar], ‘fast’ : ‘slap’

/t/ : /k/  
bakar  pamakar  [°bekar] : [pemakel], ‘anchor’ : ‘village head’

/k/ : /r/  
rour  rour  [rou] : [rou], ‘betel’ : ‘mixed’

/n/ : /l/  
ofaj  nofar  [næfæ] : [næfar], ‘mark, spot’ : ‘to bargain’

/l/ : /l/  
garakan  pamakar  [°garakan] : [pemakel], ‘omen’ : ‘village head’

/h/ : /n/  
nosan  nosaj  [nosæn] : [nosæn], ‘to forge, weld’ : ‘to knit’

/l/ : /h/  
cikar  pamakar  [kæker] : [pemakel], ‘fully loaded’ : ‘village head’
The phone [t] appears only at the string-final position. This phone can be determined to be an allophone of /t/ for the reason that [—r—] of hayar (‘dream, fantasy’) is altered to [—r—] when suffixed as hayar-an (‘dream, imagination’). In addition, [r] and [t] are distributed complementarily, and the flap [r] is a similar phone to the lateral approximant [t] in terms of being liquids.

The contrastive alveolar consonants and the relevant rules are postulated in Table 4. Note that /d, n/ have comparatively low status as phonemes because they scarcely occur in the environment _i_

It should be clarified how the affricate [ʃ] differs from the plosive [t] and the fricative [ɕ] in terms of the plosive- and fricative-like portion of the affricate.

In Figure 5, the sound associated with closure for the [t] can be seen between 4.7–4.93 sec. in the leftmost panels, and for its release burst between 4.93–4.94 sec. In comparison, the release burst of the [ʃ] in the middle panels (12.45–12.47 sec.) is modified as a prolonged frication whose spectrogram activity is similar to that of the sound associated with the [ɕ] in the rightmost panels (5.03–5.17 sec.).
There are two reasons to construe the affricate as a single unit. First is that the portion of frication in an affricate is not of as much duration as in a fricative so that the portion of frication depends on the preceding segment \([t]\) as the release burst of a plosive does. Second is that the sequence such as plosive–fricative (e.g. \([t\!c\!]\)) does not otherwise occur in Dohoi/Kadorih.

The affricate /c/ does not occur at the string-final position, thus this phoneme is included in a subset of obstruents different from voiceless plosives and fricatives which occur at the string-final position (/p, t, k; s, h / / _ 

Of the five alveopalatal consonants /c, j, s, n, y /, only /s/ can occur in string-final position. There are only three items which have the final /-is/ sequence, karis ‘kris’, kumis ‘moustache’, and paringis ‘trowel’. On the contrary, /-as/, /-us/, and /-os/ occur extensively at the string-final position.

(23) String-final — s / — 

The approximants \([\varepsilon]\) and \([\varepsilon]\) can appear only at the string final position, and they are in free variation with canonical allophonic realization of the fricative /s/ (\([\varepsilon], [\varepsilon]\)). For instance, poros ‘ache, ill’ is pronounced as [poro\varepsilon] or [poro\varepsilon]. Spectrograms covering frequency upto 10,000Hz is represented in Figure 6.
Figure 6  Spectrograms of [poro] and [poro] ('ache, ill': in free variation)

The spectrogram activity (especially 4,000–8,000Hz) of [g] in the right panel in Figure 6 is clearly weaker than the one of [c] in the left panel.

The contrastive alveopalatal consonants and the relevant rules are postulated in Table 5. Note that the phoneme /y/ has little status because there are only seven items for /y/.

Table 5   Alveopalatal consonants and the relevant rules  
(els. = elsewhere, vl. = voiceless, vd. = voiced, * = optional rule)

2.5  Velar consonants

There are three velar consonants, namely /k, g, ŋ/. 

---

Phonemic Sketch of Dohoi/Kadorih
(24) **String-initial** — k, g, η / \_

/k/ : /g/ kambut gambuh [kambu`;\] : [g`ambu`], ‘woven bag’ : ‘bounce’
: /η/ kafuk nafuk [kafuk] : [nafuk], ‘iguana’ : ‘to pile up’
: /p/ kariŋ pariŋ [kariŋ] : [pariŋ], ‘to lie down’ : ‘most’

/g/ : /η/ garakan garakup [gəɾəkəŋ] : [ŋəɾəkəŋ], ‘omen’ : ‘to clench one’s fist’
: /b/ garaj baraj [ŋəɾəʃ] : [məɾəʃ], ‘bracelet’ : ‘earthenware cooking pot’

At the string-final position, /k/ and /g/ can occur while /g/ cannot occur.

(25) **Intervocalic** — k, g, η / V — V

/k/ : /g/ oko ago [oko] : [o°go], ‘old’ : ‘grandfather’
: /η/ bokon boŋon [bokoŋ] : [boŋon], ‘Not!’ : ‘all by oneself’
: /p/ naka napa [maka] : [napa], ‘jackfruit’ : ‘to make, do’

/g/ : /η/ ogo rojo [o°go] : [rojo], ‘grandfather’ : ‘arm’
: /b/ mugas cuba [mu`gəs] : [fu`ba], ‘to give power’ : ‘hey, say’

At the string-final position, /k/ and /η/ can occur while /g/ cannot occur.

(26) **String-final** — k, η / /

/k/ : /η/ turak turaj [turuk] : [tureŋ], ‘to go’ : ‘bone’
: /p/ dorak dorap [dɔɾek] : [dɔɾap], ‘flower’ : ‘spleen’
: /m/ boraj boram [məɾəŋ] : [məɾəm], ‘itching powder’ : ‘palm wine’

The contrastive velar consonants and the relevant rules are postulated in Table 6.

Table 6 Velar consonants and the relevant rules
(els. = elsewhere, vl. = voiceless, vd. = voiced)
2.6 Glottal consonant

The glottal consonant /h/ is labialized to [h] adjacent to /u/, and altered to advanced velar fricative [x] adjacent to /i/. [h] and [x] appears either at the string-final position or before a voiceless plosive/affricate T. Before i, [x] is not realized, alternatively the glottal fricative [h] is realized, and at the same time, the succeeding i is realized with a slightly retracted tongue root.

(27) Glottal allophones conditioned by adjacent vowels

|h(i)|: hiag [hwaŋ] 'great-great-grandparents'
|h(u)|: huaj [hwaŋ] 'will, shall'
|h|: hajo, henda, horas 'big', 'turmeric', 'sweat'

[(i)x]: doih [pʰoiχ], ihco [iχo] 'needle', 'one'
[(u)h]: auh [ruŋ], puhti [pʰuθi] 'voice', 'white'

[|h|]: buah, beleh, amoh 'Yes!', 'youth', 'where'

With attention to the allophonic realization in (27), contrastive pairs concerning the adjacent i and u are considered (28, 29, 30).

(28) String-initial — h / __, __ i, __ u

/h/ : /k/ hafun kaβuk [kroŋ] : [kroŋ], 'tomorrow' : 'iguana'
/hi/ : /ki/ hira kirap [kreŋ] : [kreŋ], 'in the direction of' : 'lightning'
/hi/ : /si/ hira siran [gireŋ] : [gireŋ], 'in the direction of' : 'foot + lower leg'
/hu/ : /ku/ hureg kurat [kureŋ] : [kureŋ], 'sloping' : 'mushroom'
/su/ : /huaj suar [huren] : [huren], 'will, shall' : 'lamp (hunting)'
/pu/ : /huaj puan [hüŋ] : [puseŋ], 'will, shall' :

'durian-size fruit with persimmon taste'

(29) Intervocalic — h / V __ V, V __ i, V __ u

/h/ : /β/ mahaj maβak [mβen] : [meβak], 'hard' : 'to bite'
: /k/ bahai bakai [bʰaŋ] : [bʰaŋ], 'shoulder' : 'not yet finished'
/h/ : /βi/ bahiq baiqu [bʰeq] : [bʰeq], 'air, wind' : 'female (animal)'
/hi/ : /ki/ tahi takip [t̼eq] : [t̼eq], 'long (time)' : 'ladle'
/hi/ : /si/ mahu musit [muh] : [muh], 'to wash up' : 'to shatter, hatch'
/hu/ : /ku/ tohun toßun [t̼oŋ] : [t̼oŋ], 'middle' : 'sugarcane-LINKER'
: /ku/ dahuq dukun [dʰuŋ] : [dʰuŋ], 'thunder' :

'to sit (with the knees bent to one side)'
/su/ : /pohuk osuk [pʰuŋ] : [pʰuŋ], 'female (bipedal)' : 'my grandchild'
/pu/ : /nahuaj napunan [nɐŋ] : [napuŋ], 'to want something' : 'to collect up'
(30) String-final — h / __], i __], u __]

/h/ ː /k/ نعمب نمباب [نعمبه] : [نمبابك], ‘to worship’ : ‘to shoot’
/i/ ː /k/ تانيك تانيك [ثيربيك] : [ثيربيك], ‘flat’ : ‘sleeping mat’
/ŋ/ ː /s/ ڏورىي لپىز [ڏوريش] : [ڏوريش], ‘to drink’ : ‘kris’
/u/ ː /k/ پپعك پپعك [پپعك] : [پپعك], ‘bottles’ : ‘to wash (clothes)’
/ŋ/ ː /u/ اع کوسيس [عه] : [عه], ‘voice’ : ‘thirsty’
/ŋ/ ː /u/ نوک خوپ [نوكى] : [نوكى], ‘toward’ : ‘in the hand’

String-final h is indispensable for distinguishing some pairs, for example:

(31) تار [تري] ‘rope’ ـ تارى [تريخ] ‘taro’

مک [مکه] ‘to open’ ـ مکک [مکهه] ‘to throw’

داندا [نپند] ‘fine, penalty’ ـ دانچ [نپنده] ‘slow, late’

It must be noted here that there are consonant sequences such as [glottal fricative]–[voiceless plosive/affricate] hT as Hudson has suggested. *9 Most of the sequence hT is in free variation *10 with the segment T as in (32), but contrasts can be seen in certain items as in (33).

(32) T ـ hT in free variation

پ ـ ہپ: نیپ [نیپو] ـ [نیپو] ‘tooth’
ت ـ ہت: ینمتو [ینمتو] ـ [ینمتو] ‘to shut the eyes’
ک ـ ہک: نوک [نوکت] ـ [نوکت] ‘to shiver’

(33) T : hT in contrast (not in free variation)

نوت نوتو [نوت] : [نوت] ‘(personal name)’ : ‘to see’

If a given Dohoi/Kadorih lexical item lacks h before T, and at the same time, it is in homonymic relation with an Indonesian lexical item, then it is more likely to be pronounced in the hT form.

---

*9 “Dohoi is distinctive among all the Barito isolecits for its medial preaspirated voiceless stops and affricate” (Hudson 1967: 53).
*10 The realization of hT is restricted only to the position before string-final vowel:

اکپع [اکپو]ـ [اکپو] ‘to carry’ ～[ئبکپو], [ئبکپو]
نوکپع [نوکپع]ـ [نوکپع] ‘to spring, jump’ ～[ئبکپع], [ئبکپع]
### Phonemic Sketch of Dohoi/Kadorih

Table 7  Glottal consonant and the relevant rules (v1. = voiceless, T = v1. plosive/affricate)

### 3  Vowels

Santoso et. al. (1984) assumes five vowel phonemes /a, e, i, u, o/ with references to six minimal pairs and provides examples concerning each distribution, string-initial/-medial/-final (pp. 19–22). In addition, it exhibits diphthongs /ay, oy, aw, uy, ow/ as the phonemes in “Ot Danum”, although “the diphthongs occur only at the string-final position” (pp. 22–23).

In § 3.1, (sub-) minimal pairs of monophthongs are exhibited to account for each phonemic status of vowels. In § 3.2, three conditions for a diphthong will be specified, then, the diphthongs in Dohoi/Kadorih are not phonemic but predictable.

#### 3.1  Monophthongs and their acoustic spaces

(35) *String-first vowels*

| /a/ : /i/ | ahi  | [ahi] : [ihi], 'there' : 'that' |
|           | ihi  | [ihi] : [ihi], 'there' : 'that' |
| aai       | [aai] : [aai], 'Not!' : 'who' |
| /a/       | ataj | [ataj] : [ataj], 'birds of prey' : 'debt' |
| baru      | [baru] : [baru], 'widow' : 'body hair' |
| /e/       | etaj | [etaj] : [etaj], 'birds of prey' : 'single strap' |
| bahon     | [behon] : [(rembet') behon], 'cinder' : 'handbag' |
| /o/       | oro  | [oro] : [oro], 'pounder' : 'although' |
| aka       | [aka] : [aka], 'number symbols' : 'older sibling' |
| /i/ : /u/ | mia  | [miu] : [muu], 'shy, ashamed' : 'to bear fruit' |
| riou      | [riou] : [ruou], 'soul, ghost' : 'swamp, lake' |
| /e/       | iku  | [iku] : [iku], 'tail' : 'mine' |
Figure 7 represents formant plots of string-first vowels (352 vowels), F1 on the y-axis and F2 on the x-axis. No vowel space overlaps. This fact implies that there are explicit acoustic inter-distinctions among the five vowels at the string-first position.

(36) String-second vowels

Kazuya INAGAKI

sita seta [citi] : [ceti (erut)], ‘to love’ : ‘seats in a boat’
pirik potik [pi tık] : [potık], ‘sketch, drawing’ : ‘wasp’
mirok moros [miroc] : [moroc], ‘squinting’ : ‘wild (animal)’

| utaq etaq | /u/ | /e/ | /o/ | /u/ | /e/ | /o/ |

butih beki [mbutix] : [mbeti], ‘wart (black)’ : ‘body’
butih both [mbutix] : [mbotix], ‘wart (black)’ : ‘calf’

jerak jora [derek] : [dor], ‘light (lamp)’ : ‘tongue’

**Figure 7** Formant plots of string-first vowels (left), average values of the first and second formant frequencies of each first vowel (right)
Phonemic Sketch of Dohoi/Kadorih

: /o/ tikus tikos [tikuc] : [tikoc], 'rat, squirrel': 'riddle'
/e/ : /o/ sohpej sohpot [sohpɛʃ] : [sohpot], 'conch shell': 'blow-pipe'

There are only a few items which possess e (around 7% in 1000 items) in comparison to items composed of other vowels.

Vowel and glide (-like) consonant are contrastive to each other.

(37) /u/ : /ø/ baui bajii [mbeui] : [mbye(3i], 'lid, cap': 'female'
/ɪ/ : /y/ io yo [io] : [jo], '(s)he': 'Yes!'

3.2 Diphthongs

There is a series of falling diphthongs whose second portions are the gliding high vowels, i or u ('\^{}') and ('\_') indicate high and low pitch respectively).

(38) /aɪ/ amai [e\_m\_i] 'father' /au/ ucau [u\_\_\_u] 'bamboo, shoot'
/oɪ/ ahtoi [e\_h\_t\_o\_i] 'liver' /ou/ isou [i\_\_\_\_o\_u] 'chopper'

/ai/ ahpuï [e\_h\_p\_u\_i] 'fire' /iu/ ohciu [\_\_\_\_h\_\_ci\_u] 'animal'

A diphthong must at least meet three conditions.

The first condition is that the second portion of a diphthong must be a high vowel. If the second portion is a high vowel, a falling pitch is realized in the vowel sequence (VV). In contrast, the pitch realization of vowel sequences ao, ua, uo, whose second portions are not high vowels, is different from the pitch realization in (38). In this case, a slight falling pitch is realized in the second portion of a vowel sequence (39: VV').

(39) /aʊ/ qatao [ŋ\_t\_a\_o\_o\_o\_], 'to laugh' /u/ somuo [s\_\_\_m\_u\_o\_] 'sebum in pores of nose'

The second condition is that a diphthong must occur at the string-final position. If a vowel sequence occurs with a succeeding consonant, then the pitch realization is the same as the pitch curves as in (39), where the pitch falling starts at the second element position of the vowel sequence.

(40) /ai/ kabaim [ks\_\_\_m\_b\_a\_i\_m\_] 'because of you'
/au/ haramauj [h\_\_\_r\_a\_m\_m\_u\_j\_] 'tiger'
/ou/ totaus [\_\_\_\_t\_o\_r\_a\_], (1.1.\_)'deer'
/iu/ hasium [\_\_\_\_\_h\_s\_i\_u\_m\_] 'to kiss each other'

The third condition is that a diphthong cannot compose a string by itself. If a string is composed only of a bi-vowel sequence, the pitch pattern in (39, 40) appears again.

—38—
The observations of falling pitch in (38) and (41) are supported by the following paired acoustic analysis which compares the F0 curve of bau ‘mouth’ to that of pambau ‘window’ (F0: fundamental frequency).

Every sequence composed of three vowels appears as single monophthong + diphthong, not as diphthong + monophthong.

(42) * baui ‘lid, cap’  * *ui [mb'oul] |  * *au * [mb'eu]  
    * joui ‘toad’  * *ou [d'ou] |  * *oi * [d'ou]
    * pakaraiu ‘the last’  * *iu [pek'eu] |  * *ai * [pek'eu]

In sum, a vowel sequence is not a diphthong but a vowel hiatus (i) if the second portion of a sequence is not a high vowel, and/or (ii) in the context _C \_ or _V \_ , and/or (iii) if a vowel sequence is the only vocalic part in the relevant string.

It must be noted that there is a contrast between true diphthong and fake diphthong as shown in (43).

(43) true vs. fake diphthong  (VV vs. V+V)

[mb'oru] : [mb'oru], ‘fruit for food (slang)’ : ‘hungry’

Certain kinds of lexical specification such as a syllable boundary between o and u in borou ‘hungry’ are required for the distinction of true and fake diphthong pair. In this paper, the underlying form for the fake diphthong, /borou/ is assumed, in which the mark /'/ represents “non-finality of its own string”.

---
Phonemic Sketch of Dohoi/Kadorih

The contrastive vowels and the relevant rules are postulated in Table 8. These rules predict allophonic realizations of diphthongs (or complex vowel sequence) as well as monophthongs. Note that the phoneme /e/ has a very low status as a phoneme because it scarcely occurs in strings.

<table>

4 Conclusion

Santoso et al. (1984) only listed items which have a phoneme. In this paper, new description and analysis of the Dohoi/Kadorih sound system are provided.

The contribution of this paper can be summarized by the following five points. This paper (a) demonstrates allophones of each phoneme and some of the acoustic correlates of them (specifically, prenasalization versus nasal portion of ND sequence, the approximantization of /s/ as a free variation, plosive-affricate-fricative contrast, formant plots of vowels, and F0 curves of a hiatus versus a diphthong), (b) organizes (sub-) minimal pairs and refers strictly to contrasts, resulting in twenty three phonemes (Table 9, 10 in Appendix), (c) clarifies the status of each phoneme by indicating distributional deviations (eight string-final only; y just seven items; 9 intervocalic only; d, n none */ [ __ i; e extremely few), (d) postulates generative phonological rules for each phonemic segment (most allophones are derived by fronting rule, prenasalization rule, and nonrelease rule), and (e) states three conditions for a diphthong (high vowel second, string-final position, no string by itself). Diphthongs are predictable by the rules for vowels.

ドホイ/カドリ語音素の大要

(オーストロネシア諸語: インドネシア、カリマンタン、カハヤン川源流)

稲垣 和也 (INAGAKI Kazuya)

Abstract

本論文によるドホイ/カドリ語の新たな記述と分析は、以下の音声学的、音韻論的側面を明らかにすることによって、Santoso et al. (1984) の音素についての素描の全体を補う。

I. おのおのの音素の異音に関する調音音声学的な記述と音響音声学的な相関 (前鼻音と同器官的鼻音、自由変異としての /s/ の接近音化、破裂-破擦-摩擦の対比、母音のフォルマントプロット、母音連続と二重母音の F0 曲線)

II. (準-)最小対を整理することで対立に厳密に言及したものの二十三の音素

III. 分布的な偏りを根拠とする各音素のステータス (音列末尾のみの i、七項目のみに現れる y、音列中間のみに現れる β、/ [ i の環境で生起しない d と n、極端に少数の e ])

IV. 子音音素の異音を導出する規則 (大半の異音は前方化規則 (fronting rule)、前鼻音化規則 (prenasalization rule)、無開放規則 (nonrelease rule) によって導かれる)

V. 二重母音であるための三つの要件 ( [i] 第二要素狭母音、[ii] 音列末尾位置の生起、[iii] それのみで音列を構成しない) と、母音音素の異音を導出する規則
