Embedding Theorem for Lattices with Complementation

Hiroakira Ono (Hiroshima University)

§ 1. Introduction

In this paper, we will show embedding theorem for lattices with complementation. Our aim is twofold; one is of course, a study of lattice theory and the other is a semantical study of some nonclassical logics. We will first explain this relationship in the following.

As is well-known, the following representation theorem for distributive lattices holds, which is proved by Birkhoff and Stone (see [1]); a lattice is distributive if and only if it is isomorphic to a ring of sets. Thus, every distributive lattice can be embedded in a complete distributive lattice, which is made of the power set of a set. This can be proved in the following way. Let $F^*(L)$ be the set of all prime filters of a given distributive lattice $L$, and $A_{F^*}(L)$ be the set of all subsets of $F^*(L)$. Then, the mapping $h : L \rightarrow A_{F^*}(L)$ defined by

$$ h(a) = \{ F \in F^*(L) \mid a \in F \} $$

for each $a \in L$, gives a lattice isomorphism.

This method can be applied to show the embedding theorem for various algebras, which are distributive as lattices. For example, let $A$ be any Heyting algebra. Then, $F^*(A)$ is partially ordered by the set inclusion $\subseteq$ in this case, so we will take the set of all closed subsets of $F^*(A)$, instead of the power set, for $A_{F^*}(A)$. Here, we say that a subset $S$ of a p.o. set $M$
is closed if

(2) \( x \in S \) and \( x \leq y \) imply \( y \in S \).

Then, it can be shown that \( A_{P^*}(A) \) is a Heyting algebra and that the mapping defined similarly as (1) is an isomorphism for Heyting algebras.

Here, we will call informally a set \( P^*(A) \) a dual space for a Heyting algebra \( A \). In general, for any given class \( A \) of algebras, a class \( M \) of structures, called the class of dual spaces for \( A \), will be required to satisfy at least the following:

1) for each algebra \( A \) in \( A \), we can construct a structure \( X(A) \) in \( M \),

2) for each \( X \) in \( M \), we can construct an algebra \( A_X \) in \( A \),

3) there exists an embedding \( h \) from \( A \) to \( A_{X(A)} \), for each \( A \) in \( A \).

From a logical point of view, the problem of finding a suitable class of dual spaces for a given class of algebras is closely related to the problem of finding a suitable Kripke-type (or relational) semantics for a given logic. This relationship will be shown schematically as follows:

completeness theorem for L with respect to the Kripke-type semantics | embedding theorem for each algebra in $A$, via its dual space

In the following two sections, we will introduce dual spaces for various lattices with complementation and prove the embedding theorem for them, by using Goldblatt's method in [3], which is based on the idea developed in [2]. In §4, we will show how these results can be translated into completeness theorem for corresponding logics.

§ 2. Distributive lattices with complementation

We will consider four kinds of complementations on lattices. Let $L$ be a lattice having the minimum element 0 and the maximum 1, and $'$ be a unary operation on $L$. We will consider the following conditions on $'$:

1. $a \cap a' = 0$ for each $a$,
2. $a \leq b'$ implies $b \leq a'$, for each $a, b$,
3. $(a')' \leq a$ for each $a$,
4. $a \cap b = 0$ if and only if $a \leq b'$, for each $a, b$.

Then, the operation $'$ is

- a weak pseudo-complementation, if it satisfies (1) and (2),
- a pseudo-complementation, if it satisfies (4),
- a quasi-complementation, if it satisfies (2) and (3),
- an ortho-complementation, if it satisfies (1), (2) and (3).

We can show easily the following.

LEMMA 1. 1) Any pseudo-complemented lattice is a weakly pseudo-complemented lattice.
2) Any pseudo-complemented lattice satisfying that \((a')' \leq a\)
for each \(a\) is an orthomodular lattice, but the converse does not hold.

3) Any ortho-complemented distributive lattice is a Boolean algebra.

In this section we will consider distributive lattices with complementation. We will introduce six kinds of spaces, in the following.

**DEFINITION 1.** 1) An \(S_I\)-space is a triple \(< X, \leq ; \perp >\) such that

1) \(< X, \leq >\) is a nonempty p.o.set with a partial order \(\leq\),
2) \(\perp\) is an irreflexive, symmetric relation on \(X\) satisfying that \(x \perp y\) and \(y \leq z\) imply \(x \perp z\) for every \(x, y, z\).

2) An \(S_{II}\)-space is a triple \(< X, \leq ; \perp >\) such that

1) \(< X, \leq >\) is a nonempty p.o.set with a partial order \(\leq\),
2) \(\perp\) is a binary relation on \(X\) satisfying the condition that \(x \perp y\) if and only if there exist no \(z\)'s such that \(x \leq z\) and \(y \leq z\).

3) An \(S^*\)-space is a quadruple \(< X, \leq , * ; \perp >\) such that

1) \(< X, \leq >\) is a nonempty p.o.set with a partial order \(\leq\),
2) \(*\) is a unary operation on \(X\) such that i) \((x^*)^* = x\) and ii) \(y \leq x^*\) implies \(x \leq y^*\),
3) \(\perp\) is a binary relation on \(X\) satisfying the condition that \(x \perp y\) if and only if \(y \not\leq x^*\).

4) A \(T_0\)-space is a pair \(< X ; \perp >\) of a nonempty p.o.set \(X\) and a symmetric relation \(\perp\) on \(X\).

5) A \(T_I\)-space \(< X ; \perp >\) is a \(T_0\)-space satisfying that \(\perp\) is also irreflexive.
6) A $T_{III}$-space is a pair $< X ; \perp >$ of a nonempty set $X$ and a binary relation $\perp$ satisfying the condition that

$$x \perp y \text{ if and only if } x \neq y.$$ 

In each space $S$ in the above definition, the set $X$ is called the underlying set of $S$. The following can be easily verified.

**LEMMA 2.** 1) If $< X, \leq ; \perp >$ is an $S_{I}$-space then $< X ; \perp >$ is a $T_{I}$-space.

2) Any $S_{II}$-space is an $S_{I}$-space.

3) The relation $\perp$ in any $S^{*}$-space is symmetric.

4) Any $T_{III}$-space is a $T_{I}$-space.

5) Let $< X, \leq ; \perp >$ be an $S_{II}$-space with the trivial order $\leq$, i.e., $x \leq y$ implies $x = y$ for each $x, y$. Then, $< X ; \perp >$ is a $T_{III}$-space. Conversely, every $T_{III}$-space supplemented by the trivial order is an $S_{II}$-space.

6) Let $< X, \leq , * ; \perp >$ be an $S^{*}$-space with the trivial order $\leq$ such that $x^{*} = x$ holds for each $x$. Then $< X ; \perp >$ is a $T_{III}$-space. Conversely, each $T_{III}$-space $< X ; \perp >$ supplemented by the trivial order and a unary relation $*$ satisfying $x^{*} = x$, is an $S^{*}$-space.

Let $\perp$ be any fixed binary relation on a set $X$. For each subset $S$ of $X$, define a subset $S^{\perp}$ of $X$ by

$$S^{\perp} = \{ x \in X ; \text{ for each } y, y \in S \text{ implies } x \perp y \}.$$ 

For any p.o.set $X$, a subset $S$ of $X$ is said to be closed if $x \in S$ and $x \leq y$ imply $y \in S$.

**LEMMA 3.** Let $S$ be an $S_{I}$-space or an $S_{II}$-space or an $S^{*}$-space, with the underlying set $X$. If $S, S_{1}$ and $S_{2}$ are closed
subsets of $X$ then $S_1, S_2 \cup S_2$ and $S_1 \cap S_2$ are also closed.
Moreover, if $S_i$ is a closed subset of $X$ for each $i \in I$ then
both $\bigcup_{i \in I} S_i$ and $\bigcap_{i \in I} S_i$ are also closed.

**Lemma 4.** For each closed subsets $S_1$ and $S_2$ of $X$,

$$S_1 \cup S_2 = (S_1 \uparrow \cap S_2 \uparrow) \uparrow$$

holds, if $S$ is either an $S^*$-space or a $T_{III}$-space.

**Proof.** Since $S_1 \cup S_2 \subseteq (S_1 \uparrow \cap S_2 \uparrow) \uparrow$ holds always, we
have only to show the converse inclusion. Suppose that $S (= \langle X, \leq, *, \perp \rangle)$ is any $S^*$-space. We assume that $x$ is in

$(S_1 \uparrow \cap S_2 \uparrow) \uparrow$. Then, for every $z \in S_1 \uparrow \cap S_2 \uparrow$, $x \perp z$, i.e.,
$z \not\in x^*$. Hence, $x^* \not\in S_1 \uparrow \cap S_2 \uparrow$. So, either $x^* \not\in S_1 \uparrow$ or $x^* \not\in S_2 \uparrow$.
If $x^* \not\in S_1 \uparrow$ then $x^* \perp u$ does not hold for some $u \in S_1$. This
means that $u \leq (x^*)^* = x$ for some $u \in S_1$. Hence, $x \in S_1$.
Similarly, if $x^* \not\in S_2 \uparrow$ then $x \in S_2$. Therefore, $x \in S_1 \cup S_2$.
By using Lemma 2.6), we can show our lemma when $S$ is a $T_{III}$-

space. We remark here that every subset of $X$ is closed if

$\langle X, \leq \rangle$ is a p.o. set with the trivial order $\leq$.

**Lemma 5.** 1) Let $S$ be an $S_1$-space ( or an $S_{III}$-space or an

$S^*$-space ), with the underlying set $X$. Then, the set $A_S$ of all
closed subsets of $X$ forms a complete, weakly pseudo-complemented
(or, pseudo-complemented or quasi-complemented, respectively )
distributive lattice with respect to $\cup, \cap$ and $\perp$.

2) Let $S$ be a $T_1$-space ( or a $T_{III}$-space ) with the underlying

set $X$. Then, the power set $B_S$ of $X$ forms a complete, weakly
pseudo-complemented ( or, ortho-complemented, respectively )
distributive lattice with respect to $\cup, \cap$ and $\perp$.
Let $L$ be any lattice with the complementation $'$. A nonempty subset $F$ of $L$ is a filter (of $L$), if

1. $a \in F$ and $a \leq b$ imply $b \in F$,
2. $a \in F$ and $b \in F$ imply $a \cap b \in F$.

A filter $F$ of $L$ is proper if $F$ is a proper subset of $L$. Moreover, a proper filter $F$ is prime if

3. $a \cup b \in F$ implies either $a \in F$ or $b \in F$.

The set of all proper filters of $L$ is denoted by $F(L)$ and the set of all prime filters of $L$ is denoted by $F^*(L)$. Next, we will define a binary relation $\perp$ on $F(L)$ by

$F \perp G$ if and only if $a \in F$ and $a' \in G$ for some $a \in L$.

**Lemma 6.** 1) If $L$ is a weakly pseudo-complemented distributive lattice then $< F^*(L), \leq ; \perp >$ is an $S_I$-space, and hence $< F^*(L) ; \perp >$ is a $T_I$-space. Similarly, if $L$ is a pseudo-complemented distributive lattice then $< F^*(L), \leq ; \perp >$ is an $S_{II}$-space.

2) If $L$ is a quasi-complemented distributive lattice then $< F^*(L), \leq, * ; \perp >$ is an $S^*$-space, where $*$ is defined by $F^* = \{ x ; x' \notin F \}$.

3) If $L$ is an ortho-complemented distributive lattice then $< F^*(L) ; \perp >$ is a $T_{III}$-space.

**Proof.** 1) We will show only that $\perp$ is an irreflexive, symmetric relation on $F^*(L)$. Suppose that $F \in F^*(L)$ and $a, a' \in F$ for some $a$. Then $a \cap a' = 0 \in F$. But this contradicts the fact that $F$ is proper. Hence $F \perp F$ does not hold. Next suppose that $F \perp G$. Then there exists $a \in L$ such that $a \in F$ and $a' \in G$. Since $a \leq (a')'$ holds in every weakly pseudo-complemented...
lattice, \( a' \in G \) and \( (a')' \in F \) hold. Hence, \( G \perp F \). Next suppose that \( L \) is a pseudo-complemented lattice. We will show that \( F \perp G \) if and only if there are no \( H \)'s in \( F^*(L) \) such that \( F \leq H \) and \( G \leq H \). We assume first that \( F \perp G \), \( F \leq H \) and \( G \leq H \) for some \( H \in F^*(L) \). Then for some \( a \in L \), \( a \in F \leq H \) and \( a' \in G \leq H \). Therefore, \( a \cap a' = 0 \in H \). But, this is a contradiction. Conversely, suppose that \( F \perp G \) does not hold. Let \( E \) be the filter generated by \( F \cup G \). If \( E \) is not proper then there exist \( a \in F \) and \( b \in G \) such that \( a \cap b = 0 \). Since \( L \) is a pseudo-complemented lattice, \( b \leq a' \) follows from this. Thus, \( a \in F \) and \( a' \in G \). This implies \( F \perp G \). But this is a contradiction. So, \( E \) is proper. Therefore, \( E \) can be extended to a prime filter \( H \), which contains both \( F \) and \( G \).

2) We can show easily that \( (F^*)^* = F \) and that \( G \leq F^* \) implies \( F \leq G^* \). Next we will show that \( F \perp G \) if and only if \( G \leq F^* \).

Suppose that \( F \perp G \). Then \( G \perp F \), so \( a \in G \) and \( a' \in F \) for some \( a \). Hence, \( a \in G - F^* \). The converse of these implications holds also.

3) We will show that \( F \perp G \) if and only if \( F \neq G \). By 1), \( \perp \) is irreflexive, so \( F \perp G \) implies \( F \neq G \). Suppose that \( F \neq G \). Let \( a \in F - G \). Since \( L \) is a Boolean algebra by Lemma 1, \( a \cup a' = 1 \) holds. On the other hand, since \( G \) is prime and \( a \cup a' = 1 \in G \), \( a' \in G \). Thus, \( F \perp G \).

For each complemented distributive lattice \( L \), the dual space defined in Lemma 6 is denoted by \( S(L) \). Combining Lemma 5 with Lemma 6, we have the following.
THEOREM 7 (Embedding theorem for complemented distributive lattices) Let \( L \) be a weakly pseudo-complemented distributive lattice. Then \( L \) can be embedded in a complete, weakly pseudo-complemented distributive lattice \( A_{S}(L) \). In fact, the mapping \( h: L \rightarrow A_{S}(L) \) defined by
\[
    h(a) = \{ F \in F^{*}(L) ; \ a \in F \}
\]
for each \( a \in L \), gives a lattice isomorphism. (The mapping \( h \) can be considered also as a lattice isomorphism from \( L \) to \( B_{S}(L) \), since \( A_{S}(L) \) is a subalgebra of \( B_{S}(L) \) in this case.) Similar result holds also for pseudo-complemented or quasi-complemented distributive lattices. Similarly, the mapping \( h: L \rightarrow B_{S}(L) \) defined as the above gives a lattice isomorphism, when \( L \) is an ortho-complemented lattice.

Proof. It suffices to show that \( h \) is an isomorphism. Here we will show only that \( h(a') = h(a)^{\perp} \). Let \( F \in h(a') \). Then, \( a' \in F \). Thus, \( F \perp G \) for every \( G \in h(a) \). Conversely, suppose that \( F \notin h(a') \). We will show that there exists a prime filter \( H \) in \( h(a) \) such that \( F \perp H \) does not hold. Notice here that \( a > 0 \), since otherwise \( a' = 1 \in F \). Now define the set \( I \) by
\[
    I = \{ G ; G \text{ is a proper filter such that } a \in G \text{ and } F \perp G \text{ does not hold } \}.
\]

Let \( F_{a} = \{ x ; a \leq x \} \). Then, \( F_{a} \in I \). For, if \( F \perp F_{a} \) then \( b \in F \) and \( b' \in F_{a} \) for some \( b \). So, \( a \leq b' \) and therefore \( b \leq a' \). Hence, \( a' \in F \). But this is a contradiction. Thus, \( I \) is nonempty and inductive. So, there exists a maximal element \( H \) in \( I \) by Zorn's Lemma. Moreover, we can show that \( H \) is prime.

§ 3. Nondistributive lattices with complementation
In this section, we will deal with dual spaces for nondistributive lattices with complementation. We remark here that prime filters of lattices does not work well in nondistributive lattices. So, it is necessary to modify our approach developed in the previous section.

**DEFINITION 2.** 1) A $U_0$-space is a triple $< X, \leq; \bot >$ such that

1. $< X, \leq >$ is a nonempty meet-semilattice with respect to the partial order $\leq$,
2. $\bot$ is a symmetric relation satisfying that for each $x, y, z \in X,$
   i. if $x \bot y$ and $y \leq z$ then $x \bot z$,
   ii. if $x \bot y$ and $x \bot z$ then $x \bot (y \cap z)$.

2) A $U_I$-space is a $U_0$-space $< X, \leq; \bot >$ such that $\bot$ is also irreflexive.

3) A $U_{II}$-space is a triple $< X, \leq; \bot >$ such that

1. $< X, \leq >$ is a nonempty meet-semilattice with respect to the partial order $\leq$,
2. $\bot$ is a binary relation on $X$ satisfying the condition that
   i. $x \bot y$ if and only if there exist no $z$'s such that $x \leq z$ and $y \leq z$,
   ii. if $x \bot y$ and $x \bot z$ then $x \bot (y \cap z)$.

Similarly as Lemma 2, we have the following.

**LEMMA 8.** 1) If $< X, \leq; \bot >$ is a $U_0$-space (or a $U_I$-space) then $< X; \bot >$ is a $T_0$-space (or a $T_I$-space).
2) Any $U_1$-space is a $U_1$-space.

Let $<X, \leq; \bot>$ be a $U_0$-space. Then, a subset $S$ of $X$ is said to be $\cap$-closed if it is closed and if $x, y \in S$ implies $x \cap y \in S$. Also, a subset $S$ of $X$ is said to be regular if $(S^\bot)^\bot = S$. For each $U_0$-space $S$ with the underlying set $X$, the set of all $\cap$-closed subsets (or the set of all regular subsets, or the set of all $\cap$-closed, regular subsets) of $X$ is denoted by $C_S$ (or $D_S$ or $E_S$, respectively). Next, we will define $S_1 \lor_1 S_2$ and $S_1 \lor_2 S_2$ for each subset $S_1$ and $S_2$ of $X$ by

$$S_1 \lor_1 S_2 = \begin{cases} S_2 & \text{if } S_1 = \emptyset, \\ S_1 & \text{if } S_2 = \emptyset, \\ \{ x ; y \cap z \leq x \text{ for some } y \in S_1 \text{ and } z \in S_2 \} & \text{otherwise,} \end{cases}$$

$$S_1 \lor_2 S_2 = (S_1^\bot \cap S_2^\bot)^\bot.$$ 

Moreover, for each set $\{S_i\}_{i \in I}$ of subsets of $X$, define

$$\lor_1 S_i = \{ x ; \text{for some } m \text{ and some } i_1,\ldots,i_m \in I, \ y_{i_j} \in S_{i_j}^\bot \ (j = 1,\ldots,m) \text{ and } y_{i_1} \cap \cdots \cap y_{i_m} \leq x \},$$

$$\lor_2 S_i = (\bigcap_{i \in I} S_i^\bot)^\bot.$$ 

**LEMMA 9.** Let $<X, \leq; \bot>$ be any $U_0$-space.

1) If $S$, $S_1$ and $S_2$ are $\cap$-closed subsets of $X$ then $S$, $S_1 \cap S_2$ and $S_1 \lor_1 S_2$ are also $\cap$-closed. Moreover, if $S_i$ is a $\cap$-closed subset of $X$ for each $i \in I$ then both $\bigcap_{i \in I} S_i$ and $\lor_1 S_i$ are also $\cap$-closed.

2) If $S$, $S_1$ and $S_2$ are regular then $S$, $S_1 \cap S_2$ and $S_1 \lor_2 S_2$ are also regular. Moreover, if $S_i$ is regular for each $i \in I$ then both $\bigcap_{i \in I} S_i$ and $\lor_2 S_i$ are also regular.
We can see that $S_1 \lor_1 S_2$ (or $S_1 \lor_2 S_2$) is the smallest \n-closed (or regular) subset containing both $S_1$ and $S_2$, if both $S_1$ and $S_2$ are \n-closed (or regular, respectively).

**LEMMA 10.** 1) Let $S$ be a $U_1$-space (or a $U_{II}$-space). Then, $C_S$ forms a complete, weakly pseudo-complemented (or, pseudo-complemented) lattice with respect to $\lor_1$, $\land$ and $\bot$.

2) Let $S$ be a $T_0$-space (or a $T_I$-space). Then, $D_S$ forms a complete, quasi-complemented (or ortho-complemented) lattice with respect to $\lor_2$, $\land$ and $\bot$.

3) Let $S$ be a $U_0$-space (or a $U_I$-space, or a $U_{II}$-space). Then, $E_S$ forms a complete, quasi-complemented lattice (or ortho-complemented lattice, or pseudo-complemented lattice satisfying $(a')' \leq a$, respectively) with respect to $\lor_2$, $\land$ and $\bot$.

We can observe that the set $F(L)$ of all proper filters of a lattice $L$ forms a meet-semilattice with respect to the set inclusion. Now, we have the following lemma, which corresponds to Lemma 6.

**LEMMA 11.** 1) If $L$ is a weakly pseudo-complemented (or, a pseudo-complemented, or a quasi-complemented) lattice, then $< F(L), \leq; \bot >$ is a $U_1$-space (or a $U_{II}$-space, or a $U_0$-space, respectively).

2) If $L$ is a quasi-complemented (or an ortho-complemented) lattice then $< F(L); \bot >$ is a $T_0$-space (or a $T_I$-space).

*Proof.* We will show only that $F \bot G$ and $F \bot H$ imply $F \bot (G \cap H)$ for every $F, G, H \in F(L)$. By the assumption, there exist $a$ and $b$ such that $a \in F$, $a' \in G$, $b \in F$ and $b' \in H$. Then, clearly $a \cap b \in F$ and $a' \cup b' \in G \cap H$. Notice here
that \( a' \cup b' \leq (a \cap b)' \) holds, whenever the condition

\[ a \leq b' \implies b \leq a' \]

for each \( a, b \) is satisfied. Hence, \( a \cap b \in F \) and \( (a \cap b)' \in G \cap H \). Thus, \( F \perp (G \cap H) \). By using Lemma 8.1), 2) can be derived from 1).

**THEOREM 12** (Embedding theorem for complemented, nondistributive lattices) 1) Let \( L \) be a weakly pseudo-complemented (or a pseudo-complemented) lattice. Then, \( L \) can be embedded in a complete, weakly pseudo-complemented (or pseudo-complemented) lattice \( C_{S(L)} \). In fact, the mapping \( h' : L \rightarrow C_{S(L)} \) defined by

\[ h'(a) = \{ F \in F(L) ; a \in F \} \quad \text{for each} \quad a \in L, \]

gives a lattice isomorphism.

2) Similarly, the mapping \( h' : L \rightarrow E_{S(L)} \) gives a lattice isomorphism, when \( L \) is a quasi-complemented lattice or an orthocomplemented lattice, or a pseudo-complemented lattice satisfying \( (a')' \leq a \).

3) When \( L \) is either a quasi-complemented or an ortho-complemented lattice, \( E_{S(L)} \) is a subalgebra of \( D_{S(L)} \). Thus, \( h' \) can be also regarded as a lattice isomorphism of \( L \) into \( D_{S(L)} \), in these cases.

The above embedding theorem for each ortho-complemented lattice \( L \) into another lattice \( D_{S(L)} \) is an algebraic version of the result proved by Goldblatt [3].

§ 4. Completeness theorem

By using these embedding results, we can introduce Kripke-type semantics for logics corresponding to these lattices and
show the completeness theorem for them, as we have mentioned in § 1. Here, we will take the weakly pseudo-complemented logic as an example. Other logics can be treated quite similarly.

We will take $\land$, $\lor$ and $\neg$ as logical connectives. Formulas can be defined in the usual way. Let $L$ be any weakly pseudo-complemented lattice. An assignment $f$ of $L$ is a mapping from the set of propositional variables to $L$. Then $f$ can be extended to a mapping from the set of formulas to $L$, following the requirements:

1. $f(A \land B) = f(A) \land f(B),$
2. $f(A \lor B) = f(A) \lor f(B),$
3. $f(\neg A) = f(A)'$.

We say that a formula $B$ is derivable from formulas $A_1$, ..., $A_m$ in the weakly pseudo-complemented logic $L_{wp}$ and write

$$A_1, \ldots, A_m \vdash B,$$

if for every weakly pseudo-complemented lattice $L$ and every assignment $f$ of $L$,

$$f(A_1) \land \ldots \land f(A_m) \leq f(B) \quad (\text{or, } f(B) = 1, \text{ when } m = 0),$$

holds. (Of course, it is possible to define the logic $L_{wp}$ in a purely syntactical way. But this is not essential in the following argument.)

Next, we will introduce a Kripke-type semantics for $L_{wp}$. We call any $U_I$-space an $L_{wp}$-structure. A valuation $\models$ on an $L_{wp}$-structure $<X, \leq; \bot>$ is a relation between the set $X$ and the set of propositional variables satisfying that for each $a, b \in X$ and each propositional variable $p$,

1. if $a \models p$ and $a \leq b$ then $b \models p$,
2. if $a \models p$ and $b \models p$ then $a \land b \models p$.  

- 14 -
Each valuation $\models$ can be extended to a relation between $X$ and the set of formulas by the requirements:

(3) $a \models \neg A$ if and only if $b \not\models A$ for each $b$ such that $a \not\leq b$,

(4) $a \models A \land B$ if and only if $a \models A$ and $a \models B$,

(5) $a \models A \lor B$ if and only if i) for some $b$, $c$ such that $b \cap c \leq a$, $b \models A$ and $c \models B$, or ii) $a \models A$, or iii) $a \models 1$.

We can show that for each formula $A$,

(6) if $a \models A$ and $a \leq b$ then $b \models A$,

(7) if $a \models A$ and $b \models A$ then $a \cap b \models A$.

This can be proved quite similarly as Lemma 9 1). We say that a formula $A$ is a *semantical consequence* of formulas $A_1, \ldots, A_m$ with respect to $L_{WP}$-structures, if for each $L_{WP}$-structure $< X, \leq; \bot >$ and each valuation $\models$ on it, $a \models A_1, \ldots$ and $a \models A_m$ imply $a \models B$ for every $a \in X$. By using Lemma 10 1) and Lemma 11 1), we have the following theorem.

**THEOREM 13 (Completeness theorem for the weakly pseudo-complemented logic $L_{WP}$)** For each formula $A_1, \ldots, A_m$, $B$, $B$ is derivable from $A_1, \ldots, A_m$ in $L_{WP}$ if and only if $B$ is a semantical consequence of $A_1, \ldots, A_m$ with respect to $L_{WP}$-structures.

A different approach to Kripke-type semantics for (non-distributive) logics with some weak negations will be seen in [5]. By combining the method in [5] with the method developed in this paper, we have obtained the completeness theorem for the classical logic without the contraction rules in [6].
interesting problem which remains open is to find a suitable class of dual spaces for orthomodular lattices, or equivalently, to find a suitable Kripke-type semantics for the orthomodular logic.
