1 Introduction and Main results

In this paper, we consider the following FitzHugh-Nagumo type elliptic system:

$$(P_\lambda) \begin{cases} -\Delta u = \lambda(f(u) - v) & \text{in } \Omega, \\ -\Delta v = \lambda(\delta u - \gamma v) & \text{in } \Omega, \\ u = v = 0 & \text{on } \partial\Omega, \end{cases}$$

where $\Omega \subset \mathbb{R}^N$ ($N \geq 1$) is a bounded domain with smooth boundary $\partial\Omega$, δ, γ are positive constants, $\lambda > 0$ is a parameter and f is given by $f(u) = u(u-a)(1-u)$ where $0 < a < 1/2$. This problem is the stationary problem for the FitzHugh-Nagumo equation:

$$(D_\lambda) \begin{cases} u_t - \lambda^{-1} \Delta u = f(u) - v & \text{in } \mathbb{R}^+ \times \Omega, \\ v_t - \lambda^{-1} \Delta v = \delta u - \gamma v & \text{in } \mathbb{R}^+ \times \Omega, \\ u = v = 0 & \text{on } \mathbb{R}^+ \times \partial\Omega, \\ u(0, x) = u_0(x), v(0, x) = v_0(x). \end{cases}$$

These equation are used as a model for nerve conduction and other chemical and biological systems. See [15] and the references therein about the case where the diffusion constant of u is much smaller than the diffusion constant of v .

If we set $\delta = 0$ in (P_λ) , then the problem is reduced to the scalar problem:

$$(S_\lambda) \begin{cases} -\Delta u = \lambda f(u) & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

where the function f is the one given in the above. It is well known that for large $\lambda > 0$ there are at least two positive solutions. One is obtained as the global minimizer of

$$I_\lambda(u) = \int_\Omega \frac{1}{2} |\nabla u|^2 - \lambda F(u) dx$$

and has a boundary layer of width $O(\lambda^{-1/2})$. The other is obtained as a mountain pass solution and has a spiky shape if Ω is convex (see [11]). Moreover if Ω is a ball, Ouyang and Shi [16] obtained the exact multiplicity of solutions to (S_λ) for any $\lambda > 0$.

Our study is motivated to understand the complete dynamics of solutions for (D_λ) . Although the Lyapunov functional has been obtained in [7], we need to study the structure of solutions to (P_λ) in details to understand the complete dynamics of solutions to (D_λ) . In this paper we focus on the study of the asymptotic profiles of solutions to (P_λ) as a first step of this program.

Now we recall briefly two approaches to construct solutions to (P_λ) . See section 2 for the details. Since the second equation can be inverted to solve v in terms of u , the problem (P_λ) can be then written as a single equation for u including a nonlocal term. More precisely, if we define the operator $B_\lambda := (-\lambda^{-1} \Delta + \gamma)^{-1} : L^2(\Omega) \rightarrow H_0^1(\Omega)$, then the problem (P_λ) is reduced to the following problem:

$$(NL_\lambda) \begin{cases} -\Delta u + \lambda \delta B_\lambda u = \lambda f(u) & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega. \end{cases}$$

Klaasen and Mitidieri [13] obtained two nontrivial solutions $(\underline{u}_\lambda, \underline{v}_\lambda)$ and $(\bar{u}_\lambda, \bar{v}_\lambda)$ in some parameter range as a critical points of the functional

$$J_\lambda(u) = \int_\Omega \frac{1}{2} |\nabla u|^2 + \frac{\lambda}{2} \delta(B_\lambda u) u - \lambda F(u) dx$$

on $H_0^1(\Omega)$, where $F(u) = \int_0^u f(s) ds$. Using an a priori estimate for the solution to (P_λ) , the function f will be modified for large $|u|$, so that the functional J_λ is well defined on $H_0^1(\Omega)$. The pair $(\bar{u}_\lambda, \bar{v}_\lambda)$ is obtained as a global minimizer and $(\underline{u}_\lambda, \underline{v}_\lambda)$ is obtained by the well-known *Mountain Pass Theorem*. We will often call $(\underline{u}_\lambda, \underline{v}_\lambda)$ a *mountain pass solution*. See section 2 for details.

On the other hand, recently in [20] Reinecke and Sweers discovered a nice transformation (P_λ) to a quasimonotone system and obtained a solution (U_λ, V_λ) by using the method of sub-supersolutions for a somewhat restricted parameter range. This solution (U_λ, V_λ) is stable and has a boundary layer of width $O(\lambda^{-1/2})$. Moreover (U_λ, V_λ) is a unique solution in certain order interval. Hence we will call (U_λ, V_λ) a *boundary layer solution*. However the relation between these solutions obtained by these different approach was unclear.

In this paper, we show the global minimizer $(\bar{u}_\lambda, \bar{v}_\lambda)$ coincides with the boundary layer solution (U_λ, V_λ) for sufficient large $\lambda > 0$. Moreover, we prove that a mountain pass solution $(\underline{u}_\lambda, \underline{v}_\lambda)$ has a spiky asymptotic profile for large $\lambda > 0$ when Ω is ball.

To state our main results precisely, we need to assume the following three conditions on the parameters γ , δ and a .

Conditions . (C1) $\frac{\delta}{\gamma} < a < \gamma - 2\sqrt{\delta}$.

(C2) $\gamma - 2\sqrt{\delta} > M := \frac{(1-a)^2}{2} + \frac{1+a}{2} \sqrt{(1-a)^2 + 4\frac{\delta}{\gamma}} + 3\frac{\delta}{\gamma}$

(C3) $\frac{2a^2 - 5a + 2}{9} > \beta := \frac{1}{2}(\gamma - M) - \frac{1}{2}\sqrt{(\gamma - M)^2 - 4\delta}$

Remark . De Figueiredo and Mitidieri [6] showed that under the condition (C1) every non-trivial solution to the problem (NL_λ) is positive (see Proposition 2.4). Next we will use the condition (C2) to transform (P_λ) to some quasimonotone system and use the condition (C3) to construct a subsolution to the quasimonotone system. We also note that the condition (C3) implies $(2a^2 - 5a + 2)/9 > (\delta/\gamma)$ (see (2.2) in Section 2). If δ is sufficiently small and γ is sufficiently large then all conditions (C1), (C2) and (C3) are satisfied.

Remark . Since we compare the global minimizer $\bar{u}_\lambda$ with boundary layer solution U_λ obtained by the quasimonotone method as in [20], we assume slightly stronger conditions than the condition as in [20] and use milder modification of f .

Now we state our main results. First one is a new characterization of the boundary layer solution (U_λ, V_λ) .

Theorem 1.1. *Suppose that conditions (C2) and (C3) hold. Then there exist $\varepsilon > 0$ and $\lambda^\# > 0$ such that if (u_λ, v_λ) is a positive solution of (P_λ) with $\max_\Omega u_\lambda \in (\rho_{\delta/\gamma}^+ - \varepsilon, \rho_{\delta/\gamma}^+)$ and $\lambda > \lambda^\#$ then $u_\lambda = U_\lambda$.*

Using Theorem 1.1, we can show that the global minimizer $(\bar{u}_\lambda, \bar{v}_\lambda)$ coincides with the boundary layer solution (U_λ, V_λ) for sufficiently large $\lambda > 0$.

Theorem 1.2. *Suppose that conditions (C1), (C2) and (C3) are satisfied. Then there exists $\lambda^b > 0$ such that for $\lambda > \lambda^b$, $\bar{u}_\lambda = U_\lambda$ holds.*

Lastly, we show a spiky profile of a mountain pass solution $(\underline{u}_\lambda, \underline{v}_\lambda)$, when Ω is a ball.

Theorem 1.3. *Let $\Omega = B_1(0)$ be the unit ball in $\mathbb{R}^N$ and conditions (C1), (C2) and (C3) hold. And let $(\underline{u}_\lambda, \underline{v}_\lambda)$ be a mountain pass solution to (P_λ) . Then the followings hold.*

- (1) $\underline{u}_\lambda(0) \geq \rho_{\delta/\gamma}^-$, where $\rho_{\delta/\gamma}^-$ is a positive constant independent of λ and will be defined in Section 2.
- (2) If we set $\tilde{u}_\lambda(x) = \underline{u}_\lambda(\lambda^{-1/2}x)$, $\tilde{v}_\lambda(x) = \underline{v}_\lambda(\lambda^{-1/2}x)$, the set of functions $\{\tilde{u}_\lambda\}$, $\{\tilde{v}_\lambda\}$ are precompact in $C_{loc}^2(\mathbb{R}^N)$ and have subsequences which converge to a positive radially symmetric solution to the problem

$$(P) \begin{cases} -\Delta u = f(u) - v & \text{in } \mathbb{R}^N, \\ -\Delta v = \delta u - \gamma v & \text{in } \mathbb{R}^N, \\ u(x) \rightarrow 0 & \text{as } |x| \rightarrow \infty, \\ v(x) \rightarrow 0 & \text{as } |x| \rightarrow \infty. \end{cases}$$

- (3) $\underline{u}_\lambda \rightarrow 0$, $\underline{v}_\lambda \rightarrow 0$ as $\lambda \rightarrow +\infty$ uniformly on every compact subset of $\overline{B_1(0)} \setminus \{0\}$.

This paper is organized as follows. In section 2, we recall preliminary known results. In section 3 we first establish an a priori bound for positive solutions. Next we prove Theorems 1.1 and 1.2 and we show a lower bound estimate for the maximum of the positive solution. Finally we prove Theorem 1.3. In section 4 we state open questions for the problem (P_λ) .

2 Preliminary known results

In this section we collect some preliminary known results. First we define the operator $B_\lambda : L^2(\Omega) \rightarrow L^2(\Omega)$ as follows: for all $w \in L^2(\Omega)$, $v = B_\lambda w$ is the unique weak solution to

$$\begin{cases} -\lambda^{-1} \Delta v + \gamma v = w & \text{in } \Omega, \\ v = 0 & \text{on } \partial\Omega. \end{cases} \quad (2.1)$$

Then the second equation of (P_λ) is equivalent to $v = \delta B_\lambda u$ and by substituting into the first equation of (P_λ) we obtain the single equation including a nonlocal term

$$(NL_\lambda) \begin{cases} -\Delta u + \lambda \delta B_\lambda u = \lambda f(u) & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega. \end{cases}$$

The definition of B_λ implies that $\int_\Omega (B_\lambda u) u dx \geq 0$ and B_λ is bounded operator in $L^2(\Omega)$ with $\|B_\lambda\|_{\mathcal{L}(L^2(\Omega))} \leq 1/\gamma$. See [13] for proofs of these results.

First we describe how to construct the variational solutions in our setting. For the construction we just impose the following weaker condition:

$$\frac{2a^2 - 5a + 2}{9} > \frac{\delta}{\gamma} \quad (2.2)$$

than the condition (C3). Condition (2.2) is equivalent to the following:

$g(u) := f(u) - \frac{\delta}{\gamma}u$ has three roots $0 < \rho_{\delta/\gamma}^- < \rho_{\delta/\gamma}^+ < 1$ and satisfies

$$\int_0^{\rho_{\delta/\gamma}^+} \left(f(u) - \frac{\delta}{\gamma}u \right) du > 0.$$

Next we state a priori estimate for the solutions to (P_λ) .

Proposition 2.1. ([14, Lemma 3]) *Suppose that there exists $m = m(\delta/\gamma) > 0$ such that*

$$\frac{f(y)}{y} < -\frac{\delta}{\gamma} \quad \text{for } y : |y| > m$$

and let (u, v) be a solution to (P_λ) . Then $|u(x)| \leq m$ for all $x \in \Omega$.

To obtain the variational solution, we have to define the energy functional. We have to modify the function f as follows so that it is well defined and its critical points are the solution to the problem (NL_λ) . Now we assume furthermore condition (C1):

$$\frac{\delta}{\gamma} < a < \gamma - 2\sqrt{\delta}.$$

We note that the direct calculation for $f(u) = u(u - a)(1 - u)$ yields

$$m = m(\delta/\gamma) = \frac{a+1}{2} + \frac{1}{2}\sqrt{(a-1)^2 + 4\frac{\delta}{\gamma}}, \quad (2.3)$$

$$\begin{aligned} M = M(\delta/\gamma) &= \max\{-f'(u) | 0 \leq u \leq m(\delta/\gamma)\} \\ &= \frac{(1-a)^2}{2} + \frac{1+a}{2}\sqrt{(1-a)^2 + 4\frac{\delta}{\gamma}} + 3\frac{\delta}{\gamma} > 1 - a > a. \end{aligned} \quad (2.4)$$

(see Figure 1).

Figure 1:

Using this estimate we modify the function f to $\tilde{f}$ satisfying the following conditions.

- (1) $f(u) = \tilde{f}(u)$ for $0 < u \leq m$.
- (2) $\frac{\tilde{f}(u)}{u} < -\frac{\delta}{\gamma}$ for $|u| > m$.
- (3) $\tilde{f}'(u) = -a < -\frac{\delta}{\gamma}$ for large $u > m$ and for all $u < 0$.
- (4) $\tilde{f}'(u) + M \geq 0$ for all $u \in \mathbb{R}$.
- (5) $\tilde{f}$ is smooth.

Since we are interested in positive variational solutions, we use the modified function $\tilde{f}$ instead of f in the problem (NL_λ) . And later we show that for every nontrivial solution to (NL_λ) with modified function $\tilde{f}$ is positive. Hereafter we consider the problem (NL_λ) with $\tilde{f}$.

Next we define the following functional:

$$J_\lambda(u) := \int_\Omega \frac{1}{2} |\nabla u|^2 + \frac{\lambda}{2} \delta(B_\lambda u) u dx - \lambda \tilde{F}(u) dx, \quad (2.5)$$

where $\tilde{F}(u) = \int_0^u \tilde{f}(s) ds$. Then we can show that if $u \in H_0^1(\Omega)$ is a critical point of J_λ if and only if u is a weak solution to the (NL_λ) . Moreover by the standard bootstrap argument, $(u, v) = (u, \delta B_\lambda u)$ is a classical solution of (P_λ) .

Now we state the existence result.

Proposition 2.2. ([13, Theorem 1, Theorem 2]) *Let us assume conditions (2.2) and (C1). Then there exists $\lambda^\dagger > 0$ such that for all $\lambda > \lambda^\dagger$ there exist two nontrivial solutions $(\bar{u}_\lambda, \bar{v}_\lambda), (\underline{u}_\lambda, \underline{v}_\lambda)$ to (P_λ) satisfies $J_\lambda(\bar{u}_\lambda) < 0, J_\lambda(\underline{u}_\lambda) > 0$.*

We note that $(\bar{u}_\lambda, \bar{v}_\lambda)$ is obtained as a global minimizer of J_λ and $(\underline{u}_\lambda, \underline{v}_\lambda)$ is obtained by the *Mountain Pass Theorem* (see [3]).

Actually existence of these two nontrivial solutions to (P_λ) has been proved in [13] without condition (C1). We can show that the solutions obtained by the same procedure as in [13] to (P_λ) with the modified function $\tilde{f}$ are solutions to (P_λ) with the original f by Proposition 2.1 and the following argument.

Namely we can show that the variational solutions obtained by the procedure as in [13] to (P_λ) with the modified f are positive.

Since the positivity of the solutions is invariable by the scaling:

$$\begin{aligned} \tilde{u}_\lambda(x) &= u(\lambda^{-1/2}x), \quad \tilde{v}_\lambda(x) = v(\lambda^{-1/2}x) \\ \text{for } x \in \lambda^{1/2}\Omega &:= \{y \in \mathbb{R}^N | \lambda^{1/2}y \in \Omega\} \end{aligned}$$

we may assume $\lambda = 1$ and we consider the problem (NL_1) . Let us define the operator

$$T := -\Delta + \delta B_1, \text{ with } D(T) := H^2(\Omega) \cap H_0^1(\Omega).$$

T is a closed and a self adjoint operator. Let us denote by $0 < \mu_1 < \mu_2 \leq \mu_3 \leq \dots$ the eigenvalues of $-\Delta$ with Dirichlet boundary condition and by $\{\phi_k\}$ the corresponding eigenfunctions. It is easily seen that

$$\hat{\mu}_k = \mu_k + \frac{\delta}{\gamma + \mu_k}, \quad k = 1, 2, \dots,$$

are the eigenvalues of the operator T . Since $\{\phi_k\}$ is a complete orthonormal system in $L^2(\Omega)$, it is readily shown that $\{\hat{\mu}_k\}$ are the only eigenvalues of T .

The following proposition follows from the positivity of the resolvent operator of T (see [6, Corollary 1.3]).

Proposition 2.3. ([6, Remark 1.3]) *Let us $\gamma + \mu_1 > \sqrt{\delta}$, and $2\sqrt{\delta} - \gamma \leq \mu < \hat{\mu}_1$. If $z \in L^2(\Omega)$, $z \geq 0$ a.e. and w is a weak solution to*

$$\begin{cases} -\Delta w + \delta B_1 w - \mu w = z & \text{in } \Omega \\ w = 0 & \text{on } \partial\Omega, \end{cases}$$

then $w \geq 0$ a.e. Moreover, if $z \in C(\bar{\Omega})$, $z \geq 0$ in Ω , then $w > 0$ in Ω and the outward normal derivative satisfies $(\partial w / \partial \nu) < 0$ on $\partial\Omega$.

Now we show the positivity of solutions to problem (NL_λ) with the modified function f . We note that our modification implies that $\tilde{f}(u) \geq -au$ for all $u \in \mathbb{R}$. And we can easily check that all conditions of Proposition 2.3 with $\mu = -a$ are satisfied. Therefore every nontrivial solution u to

$$\begin{cases} -\Delta u + \delta B_1 u - (-a)u = \tilde{f}(u) + au & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega \end{cases}$$

is positive. Hence the following proposition holds (see [6, Remark 2.8]).

Proposition 2.4. ([6]) *Let us assume the condition (C1). Then every nontrivial solution to (NL_λ) with the modified function f is positive.*

Next we recall the other construction of a solution to (P_λ) due to Reinecke and Sweers [20]. Since our assumption and the modification of f is slightly different from the one in [20], we present it in details, although the strategy is the same one as in [20]. Problem (P_λ) can be transformed to quasimonotone system in some parameter range. At first we state the definition and properties of a quasimonotone system.

Definiton 2.5. Let $F_1, F_2 \in C^1(\mathbb{R} \times \mathbb{R})$. An elliptic system

$$\begin{cases} -\Delta u = F_1(u, w) & \text{in } \Omega, \\ -\Delta w = F_2(u, w) & \text{in } \Omega \end{cases} \quad (2.6)$$

is called *quasimonotone* if

$$\left| \frac{\partial F_1}{\partial u} \right|, \left| \frac{\partial F_2}{\partial w} \right| \leq K,$$

for some $K > 0$ and

$$\frac{\partial F_1}{\partial w}(u, w) \geq 0 \quad \text{and} \quad \frac{\partial F_2}{\partial u}(u, w) \geq 0, \quad \text{for all } (u, w) \in \mathbb{R} \times \mathbb{R}.$$

Definiton 2.6. $(u, w) \in C(\bar{\Omega}) \times C(\bar{\Omega})$ is called a *subsolution(supersolution)* to the elliptic problem

$$\begin{cases} -\Delta u = F_1(u, w) & \text{in } \Omega, \\ -\Delta w = F_2(u, w) & \text{in } \Omega, \\ u = w = 0 & \text{on } \partial\Omega \end{cases} \quad (2.7)$$

if it satisfies

(1)

$$\begin{aligned} -\Delta u &\leq (\geq) F_1(u, w) & \text{in } \mathcal{D}'(\Omega), \\ -\Delta w &\leq (\geq) F_2(u, w) & \text{in } \mathcal{D}'(\Omega) \end{aligned}$$

(2) $(u, w) \leq (\geq)(0, 0)$ on $\partial\Omega$.

$(u, w) \in C(\bar{\Omega}) \times C(\bar{\Omega})$ is called a *C-solution* to the problem (2.7) if it is a subsolution and a supersolution.

Proposition 2.7. ([20]) *Let $\Omega \subset \mathbb{R}^N$ be a bounded domain with smooth boundary and assume (2.7) is a quasimonotone system.*

If $(\underline{u}, \underline{w})$ and $(\bar{u}, \bar{w})$ are a supersolution and a subsolution to (2.7), respectively, with $(\underline{u}, \underline{w}) \leq (\bar{u}, \bar{w})$ on $\partial\Omega$, then there exists a C-solution (u, w) to (2.7) with

$$(\underline{u}, \underline{w}) \leq (u, w) \leq (\bar{u}, \bar{w}).$$

We note that since Ω is a bounded domain with smooth boundary $\partial\Omega$ and F_1, F_2 are C^1 , any C-solution (u, w) is actually in $C^2(\bar{\Omega}) \times C^2(\bar{\Omega})$.

Next proposition is an extension of the result of Gidas, Ni and Nirenberg [9], due to Troy [21] to the quasimonotone system.

Proposition 2.8. ([21, Theorem 1]) *Suppose that $\Omega = B_R(0)$ and (2.7) is quasimonotone. If $u > 0, w > 0$ is a solution to this system with $u, w \in C^2(\bar{B}_R(0))$, then u, w is radially symmetric and $\partial u / \partial r, \partial w / \partial r < 0$ on $(0, R)$.*

Next we explain how to transform (P_λ) to some quasimonotone system.

Under the condition (C2):

$$\gamma - 2\sqrt{\delta} > M,$$

we can define β and α by

$$\beta := \frac{1}{2}(\gamma - M) - \frac{1}{2}\sqrt{(\gamma - M)^2 - 4\delta} > 0,$$

$$\alpha = \gamma - \beta > 0.$$

Note that $-\beta(\beta + M) = \delta - \gamma\beta$ and that

$$\theta := 1 - \frac{\delta}{\gamma\beta} > 0.$$

One may verify that (u, w) is a positive solution to

$$(Q_\lambda) \begin{cases} -\Delta u = \lambda(f(u) - \beta u + \beta w) & \text{in } \Omega, \\ -\Delta w = \lambda(f(u) + Mu - \alpha w) & \text{in } \Omega, \\ u = w = 0 & \text{on } \partial\Omega \end{cases}$$

if and only if $(u, \beta u - \beta w)$ is a positive solution to (P_λ) . We note that from our modification of f , we have $f'(s) + M \geq 0$ on $\mathbb{R}$ and hence $f(s) + Ms$ is monotone increasing on $\mathbb{R}$. Moreover f' is bounded on $\mathbb{R}$. Therefore the system (Q_λ) is quasimonotone.

Next we construct a solution for (Q_λ) . We assume the condition (C3):

$$\frac{2a^2 - 5a + 2}{9} > \beta.$$

It is easy to see that the condition (C3) implies the condition (2.2).

Next to construct the subsolutions to (Q_λ) we also need the following proposition. The following proposition corresponds to the proposition 3.1 of [20]. Although our modification of f is different from the one as in [20], we can show similar way as in [20]. For readers convenience, we give the proof of the proposition.

Proposition 2.9. *Suppose that conditions (C2) and (C3) are satisfied and let $B = B_1(0) := \{x \in \mathbb{R}^N : |x| < 1\}$. Then there exists $\lambda_B > 0$ such that*

$$\begin{cases} -\Delta u = \lambda_B(\tilde{f}(u) - \beta u + \beta w) & \text{in } B, \\ -\Delta w = \lambda_B(\tilde{f}(u) + Mu - \alpha w) & \text{in } B, \\ u = w = 0 & \text{on } \partial B \end{cases} \quad (2.8)$$

has a solution (U_B, W_B) with following properties:

(1) $0 \leq (U_B, W_B) < (\rho_{\delta/\gamma}^+, \theta \rho_{\delta/\gamma}^+)$ with $\theta = 1 - \delta/(\gamma\beta)$.

(2) U_B, W_B is radially symmetric with

$$U'_B(0) = W'_B(0) = 0 \quad \text{and} \quad U'_B(r), W'_B(r) < 0 \quad \text{on } (0, 1].$$

(3) $(U_B(0), W_B(0)) > (\rho_{\delta/\gamma}^-, \theta \rho_{\delta/\gamma}^-)$ and $W_B(0) \geq \theta U_B(0)$.

Proof. Since the condition (C3) holds, for fixed large $\lambda = \lambda_B$, there exists a positive solution $\underline{u}$ to

$$\begin{cases} -\Delta u = \lambda(\tilde{f}(u) - \beta u) & \text{in } B \\ u = 0 & \text{on } \partial B \end{cases}$$

with $\max \underline{u} \in (\rho_{\beta}^-, \rho_{\beta}^+)$ (see [5]), where $\rho_{\beta}^-, \rho_{\beta}^+$ are the positive roots of $f(u) - \beta u$. Since $(\underline{u}, 0)$ is a subsolution to (2.9), and $(\rho_{\delta/\gamma}^+, \theta \rho_{\delta/\gamma}^+)$ is a supersolution with $(\underline{u}, 0) < (\rho_{\delta/\gamma}^+, \theta \rho_{\delta/\gamma}^+)$ there exists a solution (U_B, W_B) with $\underline{u} \leq U_B < \rho_{\delta/\gamma}^+$ and $0 \leq W_B < \theta \rho_{\delta/\gamma}^+$ to (2.9), see [20, Proposition A.3.]. By Proposition 2.8 we have that U_B and W_B are radially symmetric with $U'_B(0) = W'_B(0) = 0$ and $U'_B(r), W'_B(r) < 0$ on the interval $(0, 1)$. Also $(-\Delta + \lambda_B \alpha)W_B = \lambda_B(f(U_B) + MU_B) \geq 0$ and by the strong maximum principle $W'_B(1) < 0$. Let $\tau := U_B(0)$ and $V_B := \beta(U_B - W_B)$ it also follows from the maximum principle that

$$\max V_B < \frac{\delta}{\gamma} \tau. \quad (2.9)$$

Indeed, $(-\Delta + \lambda_B \gamma)(V_B - \delta\tau/\gamma) = \lambda_B(U_B - \tau) \leq 0$ in B with $V_B = 0$ on ∂B . Since by (2.9)

$$V_B(0) = \beta(\tau - W_B(0)) < \frac{\delta}{\gamma} \tau,$$

we have

$$W_B(0) > \left(1 - \frac{\delta}{\gamma\beta}\right) \tau = \theta \tau > \theta \rho_{\delta/\gamma}^-.$$

Since $(-\Delta + \lambda_B \gamma)V_B = \lambda_B \delta U_B \geq 0$, $V'_B(1) = \beta(U'_B(1) - W'_B(1)) < 0$ and hence $U'_B(1) < W'_B(1) < 0$. $\square$

Using the solution obtained above, we construct subsolutions to (Q_λ) . First we fix $z^* \in \Omega$ and set,

$$\lambda(z^*) := \lambda_B \text{dist}(z^*, \partial\Omega)^{-2}.$$

Next for all $\lambda > \lambda(z^*)$, we set

$$Z_\lambda(x) := \begin{cases} (U_B, W_B)((\lambda/\lambda_B)^{1/2}(x - z^*)) & \text{for } |x - z^*| \leq (\lambda_B/\lambda)^{1/2}, \\ 0 & \text{for } |x - z^*| > (\lambda_B/\lambda)^{1/2} \end{cases}$$

with (U_B, W_B) as in Proposition 2.9. Next we set

$$Z_\lambda^y(x) := Z_\lambda(x + z^* - y)$$

for $y \in \Omega$ satisfying $\text{dist}(y, \partial\Omega) > (\lambda_B/\lambda)^{1/2}$ and define the following family of functions:

$$\mathcal{S}_\lambda = \{Z_\lambda^y : y \in \Omega \text{ such that } \text{dist}(y, \partial\Omega) > (\lambda_B/\lambda)^{1/2}\}.$$

We recall that since $\partial\Omega$ is smooth, Ω satisfy the following *uniform interior sphere condition*:

there exists $\varepsilon_\Omega > 0$ such that

$$\Omega = \bigcup \{B(y, \varepsilon) : y \in \Omega \text{ and } \text{dist}(y, \partial\Omega) > \varepsilon_\Omega\}.$$

We may suppose that

$$\Omega_\nu := \{y \in \Omega : \text{dist}(y, \partial\Omega) > \nu\}$$

is connected for all $\varepsilon \leq \varepsilon_\Omega$ (see [5]).

The following statements, especially the part (2), are included implicitly in [20].

Proposition 2.10. ([20, Lemma 3.2]) *Suppose that conditions (C2) and (C3) are satisfied. Then*

(1) *For all $\lambda > \lambda(z^*)$, Z_λ is a subsolution to (Q_λ) and*

$$Y := (\rho_{\delta/\gamma}^+, \theta \rho_{\delta/\gamma}^+)$$

is a supersolution to (Q_λ) with $Z_\lambda < Y$. Hence there exists a solution (U_λ, W_λ) to (Q_λ) in the order interval $[Z_\lambda, Y]$.

(2) *There exist $\lambda^\times > \lambda(z^*)$ such that for all $\lambda > \lambda^\times$ every element in $\mathcal{S}_\lambda$ is a subsolution to (Q_λ) . Moreover if (u, w) is a solution to (Q_λ) in $[Z_\lambda, Y]$ then for every $Z_\lambda^y \in \mathcal{S}_\lambda$, (u, w) is a solution to (Q_λ) in $[Z_\lambda^y, Y]$.*

Proof. (1) It follows directly that Y is a supersolution. Next denote $Z_\lambda = (Z_\lambda^1, Z_\lambda^2)$, $Y = (Y^1, Y^2)$ and take $\varphi \in C_0^\infty(\Omega)$ with $\varphi \geq 0$. Then if we set $B = B_{(\lambda_B/\lambda)^{1/2}}(z^*)$, we obtain by the Green's identity

$$\begin{aligned} \int_\Omega Z_\lambda^1(-\Delta\varphi)dx &= \int_B Z_\lambda^1(-\Delta\varphi)dx \\ &= - \int_B \Delta Z_\lambda^1 \varphi dx - \int_{\partial B} \left(Z_\lambda^1 \frac{\partial \varphi}{\partial \nu} - \frac{\partial Z_\lambda^1}{\partial \nu} \varphi \right) d\sigma \\ &\leq \int_\Omega (\tilde{f}(Z_\lambda^1) - \beta Z_\lambda^1 + \beta_\lambda^2) \varphi dx. \end{aligned}$$

A similar result holds for Z_λ^2 .

Finally $\max Z_\lambda^1 = Z_\lambda^1(z^*) < \rho_{\delta/\gamma}^+ = Y^1$, $\max Z_\lambda^2 = Z_\lambda^2(z^*) < \theta \rho_{\delta/\gamma}^- = Y^2$. Hence $Z_\lambda < Y$.

(2) We can show that Z_λ^y is a subsolution in a similar way as in (1). Next we show that for large $\lambda > 0$ if (u, w) is a solution to (Q_λ) in $[Z_\lambda, Y]$ then for every $y \in \Omega$ satisfies $\text{dist}(y, \partial\Omega) > (\lambda_B/\lambda)^{1/2}$, (u, w) is a solution to (Q_λ) in $[Z_\lambda^y, Y]$. Let $\lambda^\times := \{\lambda(z^*), \lambda_B \varepsilon_\Omega^{-2}\}$. Suppose that $(u, w) \in [Z_\lambda, Y]$ is a solution to (Q_λ) with $\lambda > \lambda^\times$. As in [5] there exists for every $y \in \Omega_{(\lambda_B/\lambda)^{1/2}}$, a curve in $\Omega_{(\lambda_B/\lambda)^{1/2}}$ connecting y with z^* . Using the sweeping principle (see [20, Proposition A.6.]), it follows that $(u, w) > Z_\lambda^y$ for all $y \in \Omega_{(\lambda/\lambda_B)^{1/2}}$. $\square$

Using the earlier notation, we arrive at the important results in [20].

Proposition 2.11. ([20, Theorem 2.1, Lemma 4.2]) *Suppose conditions (C2) and (C3) are satisfied. Then there exists $\lambda^* > 0$ and a function*

$$\Lambda \in C^1([\lambda^*, +\infty), C^2(\overline{\Omega}) \times C^2(\overline{\Omega}))$$

such that $(U_\lambda, V_\lambda) := \Lambda(\lambda)$ is a positive solution to (P_λ) for all $\lambda \geq \lambda^$. Furthermore*

(1) $(U_\lambda, W_\lambda) = (U_\lambda, \beta(U_\lambda - V_\lambda))$ *is unique solution to (Q_λ) in the order interval $[Z_\lambda, Y]$.*

(2) $\max U_\lambda \in (\rho_{\delta/\gamma}^-, \rho_{\delta/\gamma}^+)$ *and* $\max V_\lambda \in \frac{\delta}{\gamma}(\rho_{\delta/\gamma}^-, \rho_{\delta/\gamma}^+)$,

(3) $\lim_{\lambda \rightarrow \infty} \Lambda(\lambda) = \left(\rho_{\delta/\gamma}^+, \frac{\delta}{\gamma} \rho_{\delta/\gamma}^+ \right)$ *uniformly on compact subsets of Ω .*

Using the results of Propositions 2.10 and 2.11, we can obtain the following proposition.

Proposition 2.12. *Suppose that conditions (C2) and (C3) and $\lambda > \lambda^*$ are satisfied. Let $y_1, y_2 \in \Omega$ be such that*

$$\text{dist}(y_1, \partial\Omega), \text{dist}(y_2, \partial\Omega) > (\lambda_B/\lambda)^{1/2}.$$

Then (u, w) is a solution to (Q_λ) in $[Z_\lambda^{y_1}, Y]$ if and only if (u, w) is a solution to (Q_λ) in $[Z_\lambda^{y_2}, Y]$.

It is shown that the solution U_λ obtained by Proposition 2.11 has a boundary layer of width $O(\lambda^{-1/2})$ (see [20] for details). Hence we often call this solution a *boundary layer solution*.

3 Proof of main results

In this section we prove the main results. We need some lemmas and propositions. Hereafter we also use the same notation f and F for the modified function $\tilde{f}$ and $\tilde{F}$.

Lemma 3.1. *Suppose that conditions (C2), (C3) hold. Then for every positive solution (u, w) to (Q_λ) we have*

$$u(x) \leq \rho_{\delta/\gamma}^+, \quad w(x) \leq \theta \rho_{\delta/\gamma}^+ = \left(1 - \frac{\delta}{\gamma\beta}\right) \rho_{\delta/\gamma}^+.$$

Proof. Let us assume that $u_0 := \max_\Omega u > \rho_{\delta/\gamma}^+$.

Step 1. First we show that $w(x) \leq \theta u_0$. From the second equation of (Q_λ) we have

$$-\Delta(w - \theta u_0) + \lambda\alpha(w - \theta u_0) = \lambda(f(u) + Mu - \alpha\theta u_0).$$

Next we have

$$\begin{aligned} & \alpha\theta u_0 - (f(u_0) + Mu_0) \\ &= (\gamma - \beta) \left(1 - \frac{\delta}{\gamma\beta}\right) u_0 - (f(u_0) + Mu_0) \\ &= \left(\frac{\beta\gamma - \delta}{\beta} - \beta + \frac{\delta}{\gamma}\right) u_0 - (f(u_0) + Mu_0) \\ &= \left(\beta + M - \beta + \frac{\delta}{\gamma}\right) u_0 - (f(u_0) + Mu_0) \\ &= \frac{\delta}{\gamma} u_0 - f(u_0) > 0. \end{aligned}$$

Here we use the relation $-\beta(\beta + M) = \delta - \beta\gamma$. Hence by the monotonicity of $f(s) + Ms$ we have

$$-\Delta(w - \theta u_0) + \lambda\alpha(w - \theta u_0) \leq 0.$$

By the maximum principle $w(x) \leq \theta u_0$ follows.

Step 2. Next we show that at a maximum point x_0 of u , $-\Delta u(x_0) < 0$. In fact from the first equation of (Q_λ)

$$\begin{aligned} -\Delta u(x_0) &= \lambda(f(u(x_0)) - \beta u(x_0) + \beta w(x_0)) \\ &\leq \lambda(f(u(x_0)) - \beta u(x_0) + \beta \theta u(x_0)) \\ &= \lambda\left(f(u(x_0)) - \frac{\delta}{\gamma}u(x_0) + \frac{\delta}{\gamma}u(x_0) - \beta u(x_0) + \beta \theta u(x_0)\right) \\ &= \lambda\left(f(u(x_0)) - \frac{\delta}{\gamma}u(x_0)\right) < 0. \end{aligned}$$

On the other hand, $-\Delta u(x_0) \geq 0$, since x_0 is maximum point. This is a contradiction. Hence we can conclude $u(x) \leq \rho_{\delta/\gamma}^+$.

Step 3. Finally we show that $w(x) \leq \theta \rho_{\delta/\gamma}^+$. At first, from the second equation of (Q_λ) , we have

$$-\Delta w + \lambda\alpha w = \lambda(f(u) + Mu).$$

Next we note that

$$\lambda\alpha\theta\rho_{\delta/\gamma}^+ = \lambda(f(\rho_{\delta/\gamma}^+) + M\rho_{\delta/\gamma}^+).$$

Subtracting and using the monotonicity of $f(s) + Ms$ it follows that

$$-\Delta(w - \theta\rho_{\delta/\gamma}^+) + \lambda\alpha(w - \theta\rho_{\delta/\gamma}^+) = \lambda(f(u) + Mu - (f(\rho_{\delta/\gamma}^+) + M\rho_{\delta/\gamma}^+)) \leq 0.$$

Hence by the maximum principle $w \leq \theta\rho_{\delta/\gamma}^+$ follows. $\square$

By the strong maximum principle we obtain the following result.

Proposition 3.2. *Suppose that conditions (C2), (C3) hold. Let Ω be any domain and the pair (u, w) be the positive solution to*

$$\begin{cases} -\Delta u = \mu(f(u) - \beta u + \beta w) & \text{in } \Omega \\ -\Delta w = \mu(f(u) + Mu - \alpha w) & \text{in } \Omega \end{cases}$$

with $u(x) \leq \rho_{\delta/\gamma}^+$, $w(x) \leq \theta\rho_{\delta/\gamma}^+$ in Ω , $\mu > 0$. And if $u(x_0) = \rho_{\delta/\gamma}^+$ (resp. $w(x_0) = \theta\rho_{\delta/\gamma}^+$) at some point $x_0 \in \Omega$, then $u(x) \equiv \rho_{\delta/\gamma}^+$ (resp. $w(x) \equiv \theta\rho_{\delta/\gamma}^+$) on Ω hold.

To prove Theorem 1.1 we also need the following lemma.

Lemma 3.3. *Suppose that conditions (C2), (C3) hold. And let Z_λ^1, Z_λ^2 be the first and second components of Z_λ , respectively, and Y^1, Y^2 be the first and second components of Y , respectively. Let (u, w) be the solution to (Q_λ) such that $Z_\lambda^1 \leq u \leq Y^1$ in Ω . Then $Z_\lambda^2 \leq w \leq Y^2$ in Ω .*

Proof. First, since the condition implies that u is a positive solution, from the second equation of (Q_λ) we have

$$-\Delta w + \lambda\alpha w = \lambda(f(u) + Mu) \geq 0 \text{ in } \Omega.$$

Since $w = 0$ on $\partial\Omega$ by the maximum principle we obtain that $w \geq 0$ in Ω .

Next we show that $Z_\lambda^2 \leq w$ in Ω . Since on $\Omega \setminus B_{(\lambda_B/\lambda)^{1/2}}(z^*)$, $Z_\lambda^2 = 0$ (see Proposition 2.10), we have only to show it on $B_{(\lambda_B/\lambda)^{1/2}}(z^*)$ (Note that Z_λ is smooth on $B_{(\lambda_B/\lambda)^{1/2}}(z^*)$). Indeed Z_λ is a subsolution to (Q_λ) and w is a solution to (Q_λ) we have

$$\begin{aligned} -\Delta Z_\lambda^2 + \lambda \alpha Z_\lambda^2 &\leq \lambda(f(Z_\lambda^1) + M Z_\lambda^1) && \text{in } B_{(\lambda_B/\lambda)^{1/2}}(z^*) \\ -\Delta w + \lambda \alpha w &= \lambda(f(u) + M u) && \text{in } B_{(\lambda_B/\lambda)^{1/2}}(z^*) \end{aligned}$$

Subtracting we have

$$-\Delta(Z_\lambda^2 - w) + \lambda \alpha(Z_\lambda^2 - w) \leq \lambda(f(Z_\lambda^1) + M Z_\lambda^1 - (f(u) + M u)) \leq 0,$$

since $Z_\lambda^1 \leq u$ and $f(s) + Ms$ is an increasing function. And we have $Z_\lambda^2 - w \leq 0$ on $\partial B_{(\lambda_B/\lambda)^{1/2}}(z^*)$. By the maximum principle we can conclude that $Z_\lambda^2 \leq w$ in Ω . We can show that $w \leq Y^2$ in a similar way as in the proof of $Z_\lambda^2 \leq w$. $\square$

Now we prove Theorem 1.1.

Proof of Theorem 1.1. If the result is false, there exists $\{\lambda_n\} \subset \mathbb{R}_+$ such that

$$\lambda_n \nearrow \infty \text{ and } u_{\lambda_n} \neq U_{\lambda_n} \text{ and } \max_{\Omega} u_{\lambda_n} \rightarrow \rho_{\delta/\gamma}^+.$$

Let $u_{\lambda_n}(x_n) = \max_{\Omega} u_{\lambda_n}$. For convenience, we divide the proof into two case.

Case 1. $\{x_n\}$ is bounded away from $\partial\Omega$

Case 2. $x_n \rightarrow \bar{x} \in \partial\Omega$ as $n \rightarrow \infty$

In this article we prove only for Case 1. Case 2 is proved by the standard blowup argument. See [18] for details.

Case 1. $\{x_n\}$ is bounded away from $\partial\Omega$, that is, there exists $C > 0$ such that

$$\text{dist}(x_n, \partial\Omega) > C > 0, \text{ for all } n \in \mathbb{N} \quad (3.1)$$

Let us set

$$\tilde{u}_{\lambda_n}(x) = u_{\lambda_n}(\lambda_n^{-1/2}x + x_n), \quad \tilde{v}_{\lambda_n}(x) = v_{\lambda_n}(\lambda_n^{-1/2}x + x_n) \text{ in } B_{R_n}(0),$$

where $R_n = \lambda_n^{1/2} \text{dist}(x_n, \partial\Omega)$. Fix $R > 0$, since $R_n \rightarrow \infty$ as $n \rightarrow \infty$, $\tilde{u}_{\lambda_n}, \tilde{v}_{\lambda_n}$ is well defined in $B_R(0)$ if n is sufficiently large. By Lemma 3.2 and the positivity of u_{λ_n}

$$0 < \tilde{u}_{\lambda_n} < \rho_{\delta/\gamma}^+ \text{ and } \tilde{u}_{\lambda_n}(0) = \max_{\Omega} u_{\lambda_n} \rightarrow \rho_{\delta/\gamma}^+ \text{ as } n \rightarrow \infty.$$

For fixed $R > R' > 0$, $(\tilde{u}_{\lambda_n}, \tilde{v}_{\lambda_n})$ satisfies

$$\begin{aligned} -\Delta \tilde{u}_{\lambda_n} &= f(\tilde{u}_{\lambda_n}) - \tilde{v}_{\lambda_n} && \text{in } B_R(0), \\ -\Delta \tilde{v}_{\lambda_n} &= \delta \tilde{u}_{\lambda_n} - \gamma \tilde{v}_{\lambda_n} && \text{in } B_R(0) \end{aligned}$$

and $(\tilde{u}_{\lambda_n}, \tilde{w}_{\lambda_n}) := (\tilde{u}_{\lambda_n}, \tilde{u}_{\lambda_n} - (1/\beta)\tilde{v}_{\lambda_n})$ satisfies

$$\begin{aligned} -\Delta \tilde{u}_{\lambda_n} &= f(\tilde{u}_{\lambda_n}) - \beta \tilde{u}_{\lambda_n} + \beta \tilde{w}_{\lambda_n} && \text{in } B_R(0), \\ -\Delta \tilde{w}_{\lambda_n} &= f(\tilde{u}_{\lambda_n}) + M \tilde{u}_{\lambda_n} - \alpha \tilde{w}_{\lambda_n} && \text{in } B_R(0) \end{aligned}$$

for sufficiently large n . Note that $\{f(\tilde{u}_{\lambda_n})\}$ is uniformly bounded in L^∞ -norm, thus $\{\tilde{u}_{\lambda_n}\}, \{\tilde{w}_{\lambda_n}\}$ is uniformly bounded in $C^\alpha(\overline{B_R(0)})$ -norm for some $0 < \alpha < 1$, by elliptic L^p estimates. Thus,

by Schauder's estimates, $\{\tilde{u}_{\lambda_n}\}, \{\tilde{w}_{\lambda_n}\}$ is uniformly bounded in $C^{2,\alpha}(\overline{B_{R'}(0)})$, and is relatively compact in $C^2(\overline{B_{R'}(0)})$. Hence there exist $U, W \in C^2(\overline{B_{R'}(0)})$ with $0 \leq U \leq \rho_{\delta/\gamma}^+$ satisfying

$$\begin{aligned} -\Delta U &= f(U) - \beta U + \beta W & \text{in } B_{R'}(0), \\ -\Delta W &= f(U) + MU - \alpha W & \text{in } B_{R'}(0), \\ U(0) &= \rho_{\delta/\gamma}^+. \end{aligned}$$

Then by Proposition 3.2 $U \equiv \rho_{\delta/\gamma}^+$ on $\overline{B_{R'}(0)}$.

On the other hand, by (3.1), if n is sufficiently large, z^* and $x_n \in \Omega$ satisfies

$$\text{dist}(z^*, \partial\Omega), \text{dist}(x_n, \partial\Omega) > (\lambda_B/\lambda_n)^{1/2}.$$

Hence by Proposition 2.12, U_{λ_n} is the first component of the *unique* solution to (Q_λ) in the order interval $[Z_\lambda^{x_n}, Y]$. Then by Lemma 3.3 and the assumption $u_{\lambda_n} \neq U_{\lambda_n}$ we have

$$u_{\lambda_n}(x) < Z_\lambda^{x_n,1}(x) = U_B((\lambda_n/\lambda_B)^{1/2}(x - x_n)) < U_B(0) < \rho_{\delta/\gamma}^+$$

at some $x \in B_{(\lambda_B/\lambda_n)^{1/2}}(x_n)$, where the function $Z_\lambda^{x_n,1}$ is the first component of $Z_\lambda^{x_n}$ and the functions U_B and constant λ_B are as in Proposition 2.9. Thus

$$\tilde{u}_{\lambda_n}(x) < U_B(0) < \rho_{\delta/\gamma}^+$$

for some $x \in B_{\lambda_B^{1/2}}(0)$ and therefore $\tilde{u}_{\lambda_n}$ cannot possess a subsequence which converges to $\rho_{\delta/\gamma}^+$ uniformly on $\overline{B_{\lambda_B^{1/2}}(0)}$. This leads to a contradiction and completes the proof for the Case 1. $\square$

Next we prove Theorem 1.2.

Proof of Theorem 1.2. First if u is the first component of the solution to (P_λ) then

$$-\Delta u + \lambda \delta B_\lambda u = \lambda f(u).$$

Multiplying u and using Green's formula, we have

$$\int_\Omega |\nabla u|^2 + \lambda \delta (B_\lambda u)u - \lambda f(u)u dx = 0.$$

Substituting this into the energy functional

$$J_\lambda(u) = \int_\Omega \frac{1}{2} |\nabla u|^2 + \frac{\lambda}{2} \delta (B_\lambda u)u - \lambda F(u) dx,$$

we have

$$J_\lambda(u) = \lambda \int_\Omega \frac{1}{2} f(u)u - F(u) dx.$$

We set $H(u) := (1/2)f(u)u - F(u)$ and let u^* be such that

$$\frac{f(u^*)}{u^*} = f'(u^*).$$

Then we note that the assumption on f implies that H is decreasing on $(u^*, +\infty)$ and $\rho_{\delta/\gamma}^+ > u^*$. Next we set

$$G(u) = \int_0^u g(v) dv = \int_0^u \left(f(v) - \frac{\delta}{\gamma} v \right) dv.$$

Claim 1. $H(\rho_{\delta/\gamma}^+) < 0$. In fact our condition implies that

$$g(\rho_{\delta/\gamma}^+) = 0 \quad \text{and} \quad G(\rho_{\delta/\gamma}^+) = \int_0^{\rho_{\delta/\gamma}^+} g(v) dv > 0.$$

Then we have

$$\begin{aligned} H(\rho_{\delta/\gamma}^+) &= \frac{1}{2} f(\rho_{\delta/\gamma}^+) \rho_{\delta/\gamma}^+ - F(\rho_{\delta/\gamma}^+) \\ &= \frac{1}{2} g(\rho_{\delta/\gamma}^+) \rho_{\delta/\gamma}^+ + \frac{\delta}{2\gamma} (\rho_{\delta/\gamma}^+)^2 - G(\rho_{\delta/\gamma}^+) - \frac{\delta}{2\gamma} (\rho_{\delta/\gamma}^+)^2 \\ &= \frac{1}{2} g(\rho_{\delta/\gamma}^+) \rho_{\delta/\gamma}^+ - G(\rho_{\delta/\gamma}^+) \\ &= -G(\rho_{\delta/\gamma}^+) < 0. \end{aligned}$$

Claim 2. There exists $\lambda^b > 0$ such that for $\lambda > \lambda^b$, $\bar{u}_\lambda = U_\lambda$. If not, there exists a sequence $\{\lambda_n\}$ such that

$$\lambda_n \nearrow \infty \quad \text{and} \quad \bar{u}_{\lambda_n} \neq U_{\lambda_n}.$$

From Theorem 1.1, there exists $\varepsilon > 0$ and $\lambda^\# > 0$ such that if (u, v) is a positive solution to (P_λ) with $\max_\Omega u \in (\rho_{\delta/\gamma}^+ - \varepsilon, \rho_{\delta/\gamma}^+)$ and $\lambda > \lambda^\#$ then $u = U_\lambda$.

Since by Proposition 2.4, $\bar{u}_{\lambda_n}$ is positive, sufficiently large n , $\max_\Omega \bar{u}_{\lambda_n} \notin (\rho_{\delta/\gamma}^+ - \varepsilon, \rho_{\delta/\gamma}^+)$.

Next we choose $\varepsilon_1, \varepsilon_2 > 0$ and $\Omega' \subset \subset \Omega$ by the following way.

First we choose $\varepsilon_2 > 0$ such that

$$(1) \quad 0 > H(\rho_{\delta/\gamma}^+ - \varepsilon) > H(\rho_{\delta/\gamma}^+ - \varepsilon_2), \quad \varepsilon < \varepsilon_2.$$

We note that by taking $\varepsilon > 0$ small, if necessary we may assume that $H(\rho_{\delta/\gamma}^+ - \varepsilon) < 0$ and we also note that $H(u)$ is decreasing near $\rho_{\delta/\gamma}^+$. Next we choose $\varepsilon_1 > 0$ so small that

$$(2) \quad (\sup_{u \geq 0} H(u) - H(\rho_{\delta/\gamma}^+))\varepsilon_1 < (H(\rho_{\delta/\gamma}^+ - \varepsilon) - H(\rho_{\delta/\gamma}^+ - \varepsilon_2))|\Omega|,$$

where $|\Omega|$ denotes the measure of Ω . Finally we choose $\Omega' \subset \subset \Omega$ so that

$$(3) \quad |\Omega \setminus \Omega'| < \varepsilon_1.$$

Then by Proposition 2.11 there exist $\lambda^b > 0$ such that for all $\lambda > \lambda^b$ and for all $x \in \Omega'$

$$\rho_{\delta/\gamma}^+ - \varepsilon_2 < U_\lambda(x) < \rho_{\delta/\gamma}^+.$$

Then we have

$$J_{\lambda_n}(\bar{u}_{\lambda_n}) = \lambda_n \int_\Omega H(\bar{u}_{\lambda_n}) dx \geq \lambda_n |\Omega| H(\rho_{\delta/\gamma}^+ - \varepsilon)$$

and

$$\begin{aligned} J_{\lambda_n}(U_{\lambda_n}) &= \lambda_n \int_\Omega H(U_{\lambda_n}) dx = \lambda_n \int_{\Omega'} H(U_{\lambda_n}) dx + \lambda_n \int_{\Omega \setminus \Omega'} H(U_{\lambda_n}) dx \\ &\leq \lambda_n (H(\rho_{\delta/\gamma}^+ - \varepsilon_2) |\Omega'| + \sup_{u \geq 0} H(u) \varepsilon_1) \\ &\leq \lambda_n (H(\rho_{\delta/\gamma}^+ - \varepsilon_2) (|\Omega| - \varepsilon_1) + \sup_{u \geq 0} H(u) \varepsilon_1) \\ &= \lambda_n (H(\rho_{\delta/\gamma}^+ - \varepsilon_2) |\Omega| + (\sup_{u \geq 0} H(u) - H(\rho_{\delta/\gamma}^+ - \varepsilon_2)) \varepsilon_1) \\ &\leq \lambda_n (H(\rho_{\delta/\gamma}^+ - \varepsilon_2) |\Omega| + (\sup_{u \geq 0} H(u) - H(\rho_{\delta/\gamma}^+)) \varepsilon_1). \end{aligned}$$

Here we used that $|\Omega'| \geq |\Omega| - \varepsilon_1$ and $H(\rho_{\delta/\gamma}^+ - \varepsilon_2)|\Omega'| \leq H(\rho_{\delta/\gamma}^+ - \varepsilon_2)(|\Omega| - \varepsilon_1)$. Therefore

$$\begin{aligned}
& \lambda_n^{-1}(J_{\lambda_n}(U_{\lambda_n}) - J_{\lambda_n}(\bar{u}_{\lambda_n})) \\
& \leq (H(\rho_{\delta/\gamma}^+ - \varepsilon_2)|\Omega| + (\sup_{u \geq 0} H(u) - H(\rho_{\delta/\gamma}^+))\varepsilon_1 - |\Omega|H(\rho_{\delta/\gamma}^+ - \varepsilon)) \\
& = (\sup_{u \geq 0} H(u) - H(\rho_{\delta/\gamma}^+))\varepsilon_1 - (H(\rho_{\delta/\gamma}^+ - \varepsilon) - H(\rho_{\delta/\gamma}^+ - \varepsilon_2))|\Omega| \\
& < 0.
\end{aligned}$$

This contradicts to the fact that $\bar{u}_{\lambda_n}$ is the global minimizer of J_{λ_n} . $\square$

To show Theorem 1.3, we prepare two lemmas. The following lemma shows that the maximum of any positive solution is bounded away from 0 uniformly in λ .

Lemma 3.4. *Suppose that conditions (C2), (C3) hold. Then for every positive solution (u, v) of (P_λ) satisfies*

$$\max_{\Omega} u \geq \rho_{\delta/\gamma}^-.$$

Proof. If we set $w = u - (1/\beta)v$, then

$$\begin{aligned}
-\Delta u &= \lambda(f(u) - \beta u + \beta w) && \text{in } \Omega, \\
-\Delta w &= \lambda(f(u) + Mu - \alpha w) && \text{in } \Omega, \\
u = w &= 0 && \text{on } \partial\Omega.
\end{aligned}$$

Now we assume that $\max_{\Omega} u < \rho_{\delta/\gamma}^-$ and set $u_0 := \max_{\Omega} u > 0$.

Step 1. We show that $w(x) \leq \theta \max_{\Omega} u = \theta u_0$. In fact we have

$$\begin{aligned}
& (-\Delta + \lambda\alpha)(w - \theta u_0) \\
& = -\Delta w + \lambda\alpha w - \lambda\alpha\theta u_0 \\
& = \lambda(f(u) + Mu) - (\gamma - \beta) \left(1 - \frac{\delta}{\gamma\beta}\right) u_0 \\
& = \lambda \left(f(u) - \frac{\delta}{\gamma} u_0 + Mu - \left(\frac{\gamma\beta - \delta}{\beta} - \beta \right) u_0 \right) \\
& = \lambda \left(f(u) - \frac{\delta}{\gamma} u_0 + M(u - u_0) \right) \\
& < 0.
\end{aligned}$$

Then by the maximum principle $w(x) \leq \theta u_0$ follows.

Step 2. If $u(x_0) = \max_{\Omega} u = u_0$ then $-\Delta u(x_0) < 0$. In fact we have

$$\begin{aligned}
& -\Delta u(x_0) \\
& = \lambda(f(u(x_0)) - \beta u(x_0) + \beta w(x_0)) \\
& \leq \lambda \left(f(u(x_0)) - \frac{\delta}{\gamma} u(x_0) + \frac{\delta}{\gamma} u(x_0) - \beta u(x_0) + \beta\theta u(x_0) \right) \\
& = \lambda \left(f(u(x_0)) - \frac{\delta}{\gamma} u(x_0) \right) < 0.
\end{aligned}$$

On the other hand since $x_0 \in \Omega$ is a maximum point of u , then we have $-\Delta u(x_0) \geq 0$. This is a contradiction. $\square$

Next by using Proposition 2.8, we obtain the following proposition.

Proposition 3.5. *Let $\Omega = B_R(0)$ and (u, v) is a positive solution to (P_λ) . Then u, v are radially symmetric,*

$$u'(r), v'(r) < 0, \text{ on } (0, R]$$

and

$$u'(0) = v'(0) = 0,$$

where ' is the derivative in $r = |x|$.

Proof. Let us set $w = u - (1/\beta)v$. (u, w) satisfies the quasimonotone system (Q_λ) and we note that w is positive in $B_R(0)$ since u is positive. Then by Proposition 2.8 u and w are radially symmetric and decreasing in $r = |x|$. We also have v is radially symmetric. Next we note that v is the solution to the problem

$$\begin{aligned} -\lambda^{-1}\Delta v + \gamma v &= \delta u & \text{in } B_R(0), \\ v &= 0 & \text{on } \partial B_R(0). \end{aligned}$$

By the regularity of solutions, we differentiate the above equation in r , then we have

$$\begin{aligned} -\lambda^{-1}\Delta v' + \left(\frac{N-1}{\lambda|x|^2} + \gamma\right)v' &= \delta u' < 0 & \text{in } B_R(0) \setminus \{0\}, \\ v' = \frac{\partial v}{\partial \nu} < 0 & & \text{on } \partial B_R(0), \end{aligned} \tag{3.2}$$

since u is decreasing in r , where ν is an outward unit normal vector of $\partial B_R(0)$. Then we can conclude $v' < 0$ on $(0, R]$. Indeed if $\max_{r \in (0, R]} v'(r) \geq 0$ then we have $\max_{r \in (0, R]} v'(r) = v'(r_0)$ for some $r_0 \in (0, R)$. Then we have

$$-\lambda^{-1}\Delta v'(r_0) + \left(\frac{N-1}{\lambda r_0^2} + \gamma\right)v'(r_0) \geq 0.$$

This contradicts to (3.2). The proof is completed. $\square$

We can obtain Theorem 1.3 by using a similar argument as in [19]. For readers convenience, we give the proof of Theorem 1.3 in details.

Proof of Theorem 1.3. First we note that from Proposition 2.8 and Lemma 3.4, we have $\underline{u}_\lambda(0) \geq \rho_{\delta/\gamma}^-$, which is (1) of Theorem 1.3. And from Theorem 1.1 we have $\max \underline{u}_\lambda$ is bound from above by $\rho_{\delta/\gamma}^+$ uniformly for sufficiently large λ . And also we note that from Proposition 2.8 $\underline{u}_\lambda$ and $\underline{v}_\lambda$ are radially symmetric, decreasing in $r = |x|$ and satisfy $u'(0) = v'(0) = 0$, where ' represents a differentiation with respect to $r = |x|$.

Part 1. Proof of (2).

Step 1.1. Let $\lambda_1 > 0$ be sufficiently large. The functions $\{\tilde{u}_\lambda : \lambda > 2\lambda_1\}$ and $\{\tilde{v}_\lambda : \lambda > 2\lambda_1\}$ satisfy

$$\begin{cases} -\Delta \tilde{u}_\lambda = f(\tilde{u}_\lambda) - \tilde{v}_\lambda & \text{in } B_{\sqrt{2\lambda_1}}(0), \\ -\Delta \tilde{v}_\lambda = \delta \tilde{u}_\lambda - \gamma \tilde{v}_\lambda & \text{in } B_{\sqrt{2\lambda_1}}(0) \end{cases}$$

and from Lemma 3.1 we have

$$\|\tilde{u}_\lambda\|_{L^\infty(B_{\sqrt{2\lambda_1}}(0))} \leq \rho_{\delta/\gamma}^+, \quad \|\tilde{v}_\lambda\|_{L^\infty(B_{\sqrt{2\lambda_1}}(0))} \leq \frac{\delta}{\gamma} \rho_{\delta/\gamma}^+$$

$$\|f(\tilde{u}_\lambda)\|_{L^\infty(B_{\sqrt{2\lambda_1}}(0))} \leq K_f := \sup_{0 \leq x \leq 1} |f(x)|.$$

Using interior elliptic estimates, Schauder's interior estimates, and the fact that f is locally Lipschitz, we find that $\{\tilde{u}_\lambda : \lambda > 2\lambda_1\}$ and $\{\tilde{v}_\lambda : \lambda > 2\lambda_1\}$ are bounded in $C^{2,\alpha}(\overline{B_{\sqrt{\lambda_1}}(0)})$ for some $0 < \alpha < 1$ and hence precompact in $C^2(\overline{B_{\sqrt{\lambda_1}}(0)})$. Then there exists a sequence $\{\lambda_{1,n}\}$ such that $\lambda_1 < \lambda_{1,n} \nearrow \infty$ as $n \rightarrow \infty$ and $\{\tilde{u}_{\lambda_{1,n}}\}, \{\tilde{v}_{\lambda_{1,n}}\}$ converge in $C^2(\overline{B_{\sqrt{\lambda_1}}(0)})$. We set for $x \in \overline{B_{\sqrt{\lambda_1}}(0)}$

$$u_1(x) := \lim_{n \rightarrow \infty} \tilde{u}_{\lambda_{1,n}}(x), \quad v_1(x) := \lim_{n \rightarrow \infty} \tilde{v}_{\lambda_{1,n}}(x).$$

On $\overline{B_{\sqrt{\lambda_1}}(0)}$ the functions u_1, v_1 are solutions of the equation

$$\begin{aligned} -\Delta u_1 &= f(u_1) - v_1 \\ -\Delta v_1 &= \delta u_1 - \gamma v_1 \end{aligned}$$

Let $\lambda_2 := \lambda_{1,1}$ and repeat the argument in Step 1.1 to obtain that $\{\tilde{u}_{\lambda_{1,n}}\}$ and $\{\tilde{v}_{\lambda_{1,n}}\}$ are bounded sequence in $C^{2,\alpha}(\overline{B_{\sqrt{\lambda_2}}(0)})$ and precompact in $C^2(\overline{B_{\sqrt{\lambda_2}}(0)})$. Again we extract subsequences $\{\lambda_{2,n}\}$ from $\{\lambda_{1,n}\}$ such that $\{\tilde{u}_{\lambda_{2,n}}\}$ and $\{\tilde{v}_{\lambda_{2,n}}\}$ converge in $C^2(\overline{B_{\sqrt{\lambda_2}}(0)})$. We extend the functions u_1 and v_1 to $\overline{B_{\sqrt{\lambda_2}}(0)}$ by defining for $x \in \overline{B_{\sqrt{\lambda_2}}(0)}$

$$u_2(x) := \lim_{n \rightarrow \infty} \tilde{u}_{\lambda_{2,n}}(x), \quad v_2(x) := \lim_{n \rightarrow \infty} \tilde{v}_{\lambda_{2,n}}(x).$$

These functions satisfy the equations on $B_{\sqrt{\lambda_2}}(0)$.

By repeating this process we obtain for every $k \in \mathbb{N}$ subsequence $\{\lambda_{k,n}\}$ from $\{\lambda_{k-1,n}\}$ such that $\{\tilde{u}_{\lambda_{k,n}}\}$ and $\{\tilde{v}_{\lambda_{k,n}}\}$ converge in $C^2(\overline{B_{\sqrt{\lambda_k}}(0)})$. And we obtain the function u_k and v_k such that for $\overline{B_{\sqrt{\lambda_k}}(0)}$

$$u_k(x) := \lim_{n \rightarrow \infty} \tilde{u}_{\lambda_{k,n}}(x), \quad v_k(x) := \lim_{n \rightarrow \infty} \tilde{v}_{\lambda_{k,n}}(x)$$

satisfy the equation on $\overline{B_{\sqrt{\lambda_k}}(0)}$. And we can choose λ_k so that $\lambda_k \nearrow \infty$ as $k \rightarrow \infty$.

Step 1.2. We define the function U, V defined on $\mathbb{R}^N$ as follows. For $x \in \mathbb{R}^N$ there exists $k \in \mathbb{N}$ such that $x \in B_{\sqrt{\lambda_k}}(0)$. Then we define $U(x) = u_k(x)$ and $V(x) = v_k(x)$. Therefore U, V satisfies

$$\begin{cases} -\Delta U = f(U) - V & \text{on } \mathbb{R}^N, \\ -\Delta V = \delta U - \gamma V & \text{on } \mathbb{R}^N. \end{cases}$$

By Lemma 3.4, we have

$$\max_{B_{\sqrt{\lambda_k}}(0)} \tilde{u}_\lambda \geq \rho_{\delta/\gamma}^-$$

and hence

$$\max_{\mathbb{R}^N} U \geq \rho_{\delta/\gamma}^- > 0.$$

Consequently $U, V \neq 0$.

Step 1.3. It remains to show that $u(x), v(x) \rightarrow 0$ as $|x| \rightarrow \infty$. By Proposition 3.5 all the functions $\tilde{u}_\lambda$ and $\tilde{v}_\lambda$ are radially symmetric. We will consider $\tilde{u}_\lambda, \tilde{v}_\lambda, U, V$ as functions of one variable $r = |x|$, in particular we have that $U'(r) \leq 0, V'(r) \leq 0$ for $r > 0$ and $U'(0) = V'(0) = 0$. Let

$$l_u := \lim_{r \rightarrow \infty} U(r) = \inf_{r > 0} U(r), \quad l_v := \lim_{r \rightarrow \infty} V(r) = \inf_{r > 0} V(r). \quad (3.3)$$

In Step 1.4 we show that

$$l_u \in \{0, \rho_{\delta/\gamma}^-, \rho_{\delta/\gamma}^+\} \quad \text{and} \quad l_v = \frac{\delta}{\gamma} l_u \quad (3.4)$$

Then by Lemma 3.1 and Theorem 1.1, there exists $\varepsilon > 0$ for sufficiently large λ

$$\tilde{u}_\lambda(x) \leq \rho_{\delta/\gamma}^+ - \varepsilon < \rho_{\delta/\gamma}^+.$$

Hence we have $l_u \leq \rho_{\delta/\gamma}^+ - \varepsilon < \rho_{\delta/\gamma}^+$ and $l_u \neq \rho_{\delta/\gamma}^+$. To exclude the possibility $l_u = \rho_{\delta/\gamma}^-$ we show in Step 1.5 that

$$\int_0^{l_u} \left(f(s) - \frac{\delta}{\gamma} s \right) ds = F(l_u) - \frac{\delta}{2\gamma} l_u^2 \geq 0. \quad (3.5)$$

Then it cannot be $l_u = \rho_{\delta/\gamma}^-$. Then the only remaining possibility is that $l_u = l_v = 0$.

Step 1.4. We prove (3.4). Because of the radial symmetry we have that

$$\begin{cases} -U'' - \frac{N-1}{r}U' = f(U) - V & r > 0, \\ -V'' - \frac{N-1}{r}V' = \delta U - \gamma V & r > 0, \\ U'(0) = V'(0) = 0. \end{cases} \quad (3.6)$$

Multiplying the first equation with U' and the second equation with V' and integrating on $(0, R)$ one finds that for all $R > 0$

$$\frac{1}{2}U'(R)^2 + (N-1) \int_0^R \frac{(U')^2}{r} dr = F(U(0)) - F(U(R)) + \int_0^R U'V dr$$

and

$$\begin{aligned} & \frac{1}{2}V'(R)^2 + (N-1) \int_0^R \frac{(V')^2}{r} dr \\ &= -\delta(U(R)V(R) - U(0)V(0)) + \delta \int_0^R U'V dr + \frac{\gamma}{2}(V(R)^2 - V(0)^2). \end{aligned}$$

Adding the above identities we find that

$$\begin{aligned} & \frac{U'(R)^2 + \delta^{-1}V'(R)^2}{2} + (N-1) \int_0^R \frac{(U')^2 + \delta^{-1}(V')^2}{r} dr - 2 \int_0^R U'V dr \\ &= F(U(0)) - F(U(R)) - (U(R)V(R) - U(0)V(0)) \\ & \quad + \frac{\gamma}{2\delta}(V(R)^2 - V(0)^2) \end{aligned} \quad (3.7)$$

and subtracting that

$$\begin{aligned} & \frac{1}{2}(U'(R)^2 - \delta^{-1}V'(R)^2) + (N-1) \int_0^R \frac{(U')^2 - \delta^{-1}(V')^2}{r} dr \\ &= F(U(0)) - F(U(R)) - U(0)V(0) + U(R)V(R) \\ & \quad - \frac{\gamma}{2\delta}(V(R)^2 - V(0)^2). \end{aligned} \quad (3.8)$$

Because $U'(R), V'(R) \leq 0$ and $U(R), V(R)$ stay bounded as $R \rightarrow \infty$ we have that from (3.7) that

$$U'(R) \rightarrow 0 \text{ and } V'(R) \rightarrow 0 \text{ as } R \rightarrow \infty.$$

Also we see from (3.6) that

$$-U''(R) \rightarrow f(l_u) - l_v \text{ and } -V''(R) \rightarrow \delta l_u - \gamma l_v \text{ as } R \rightarrow \infty$$

so that $f(l_u) - l_v = 0$ and $\delta l_u - \gamma l_v = 0$ and hence (3.4) follows.

Step 1.5. Next we prove (3.5). We first note that $(\sqrt{\delta}/\beta) - 1 \geq 0$. In fact

$$\frac{\beta}{\sqrt{\delta}} = \frac{\gamma - M}{2\sqrt{\delta}} + \sqrt{\left(\frac{\gamma - M}{2\sqrt{\delta}}\right)^2 - 1} \leq 1.$$

Next we set $\tilde{w}_\lambda = \tilde{u}_\lambda - (1/\beta)\tilde{v}_\lambda$. Then we have

$$\begin{aligned} \tilde{u}'_\lambda - \delta^{-1/2}\tilde{v}'_\lambda &= \tilde{u}'_\lambda - (\sqrt{\delta}/\beta)^{-1}\tilde{u}'_\lambda + (\sqrt{\delta}/\beta)^{-1}\tilde{w}'_\lambda, \\ &= (\sqrt{\delta}/\beta)^{-1}(\sqrt{\delta}/\beta - 1)\tilde{u}'_\lambda + (\sqrt{\delta}/\beta)^{-1}\tilde{w}'_\lambda \leq 0 \end{aligned}$$

and hence we have

$$\tilde{u}'_\lambda(r)^2 - \delta^{-1}\tilde{v}'_\lambda(r)^2 = (\tilde{u}'_\lambda(r) - \delta^{-1/2}\tilde{v}'_\lambda(r))(\tilde{u}'_\lambda(r) + \delta^{-1/2}\tilde{v}'_\lambda(r)) \geq 0. \quad (3.9)$$

From (3.8) we see by letting $R \rightarrow \infty$ that

$$\begin{aligned} (N-1) \int_0^\infty \frac{U'(r)^2 - \delta^{-1}V'(r)^2}{r} dr \\ = F(U(0)) - F(l_u) - U(0)V(0) + \frac{\delta}{2\gamma}l_u^2 + \frac{\gamma}{2\gamma}V(0)^2. \end{aligned} \quad (3.10)$$

On the other hand, for every solution $(\tilde{u}_\lambda, \tilde{v}_\lambda)$ it holds that

$$\begin{aligned} \frac{1}{2}(\tilde{u}'_\lambda(\sqrt{\lambda})^2 - \delta^{-1}\tilde{v}'_\lambda(\sqrt{\lambda})^2) + (N-1) \int_0^{\sqrt{\lambda}} \frac{\tilde{u}'_\lambda(r)^2 - \delta^{-1}\tilde{v}'_\lambda(r)^2}{r} dr \\ = F(\tilde{u}_\lambda(0)) - \tilde{u}_\lambda(0)\tilde{v}_\lambda(0) + \frac{\gamma}{2\delta}\tilde{v}_\lambda(0)^2. \end{aligned}$$

Hence from (3.9), for all $K > 0$ and all $\lambda > K^2$ it holds that

$$(N-1) \int_0^K \frac{\tilde{u}'_\lambda(r)^2 - \delta^{-1}\tilde{v}'_\lambda(r)^2}{r} dr \leq F(\tilde{u}_\lambda(0)) - \tilde{u}_\lambda(0)\tilde{v}_\lambda(0) + \frac{\gamma}{2\delta}\tilde{v}_\lambda(0)^2$$

so that

$$(N-1) \int_0^K \frac{U'(r)^2 - \delta^{-1}V'(r)^2}{r} dr \leq F(U(0)) - U(0)V(0) + \frac{\gamma}{2\delta}V(0)^2.$$

Letting $K \rightarrow \infty$ we find that

$$(N-1) \int_0^\infty \frac{U'(r)^2 - \delta^{-1}V'(r)^2}{r} dr \leq F(U(0)) - U(0)V(0) + \frac{\gamma}{2\delta}V(0)^2. \quad (3.11)$$

From (3.10) and (3.11) we have

$$\begin{aligned} F(U(0)) - F(l_u) - U(0)V(0) + \frac{\delta}{2\gamma}l_u^2 + \frac{\gamma}{2\delta}V(0)^2 \\ \leq F(U(0)) - U(0)V(0) + \frac{\gamma}{2\delta}V(0)^2, \end{aligned}$$

which is precisely (3.5).

Part 2. Finally we prove the (3), i.e., $\underline{u}_\lambda \rightarrow 0$ and $\underline{v}_\lambda \rightarrow 0$ as $\lambda \rightarrow +\infty$ on every compact subset of $\overline{B_1(0)} \setminus \{0\}$. We prove only for $\underline{u}_\lambda$. If the result is false, there exist $\Omega' \subset \subset \overline{B_1(0)} \setminus \{0\}$, $\varepsilon > 0$ and a sequence $\{\lambda_n\} \subset \mathbb{R}^+$ such that

$$\lambda_n \nearrow \infty \text{ as } n \rightarrow \infty$$

and

$$\sup_{\Omega'} |\underline{u}_{\lambda_n}(x)| \geq \varepsilon. \quad (3.12)$$

Since $\overline{\Omega'}$ is compact in $\overline{B_1(0)} \setminus \{0\}$, there exists $r_0 > 0$ such that

$$r_0^{-1} \leq |x| \leq r_0 \quad \text{for all } x \in \overline{\Omega'}.$$

Then since $\underline{u}_{\lambda_n}$ is decreasing in $r = |x|$, we have

$$0 \leq \underline{u}_{\lambda_n}(r_0) \leq \underline{u}_{\lambda_n}(x) \leq \underline{u}_{\lambda_n}(r_0^{-1}) \quad \text{for all } x \in \overline{\Omega'}.$$

where $\underline{u}_{\lambda_n}(r_0)$ and $\underline{u}_{\lambda_n}(r_0^{-1})$ are the values of the function $\underline{u}_{\lambda_n}$ considered as a function of one variable $r = |x|$ at $r = r_0$ and r_0^{-1} . Hence

$$0 \leq \tilde{u}_{\lambda_n}(\lambda_n^{1/2} r_0) \leq \underline{u}_{\lambda_n}(x) \leq \tilde{u}_{\lambda_n}(\lambda_n^{1/2} r_0^{-1}) \quad \text{for all } x \in \overline{\Omega'}$$

and

$$\sup_{\Omega'} |\underline{u}_{\lambda_n}(x)| \leq \tilde{u}_{\lambda_n}(\lambda_n^{1/2} r_0^{-1}). \quad (3.13)$$

On the other hand since $\tilde{u}_{\lambda_n}$ is decreasing in r , for fixed $r > 0$ and sufficiently large n we have

$$\tilde{u}_{\lambda_n}(\lambda_n^{1/2} r_0^{-1}) \leq \tilde{u}_{\lambda_n}(r). \quad (3.14)$$

Letting $n \rightarrow \infty$ in (3.13) and (3.14), if necessary taking a subsequence, we have

$$\overline{\lim}_{n \rightarrow \infty} \sup_{\Omega'} |\underline{u}_{\lambda_n}(x)| \leq \overline{\lim}_{n \rightarrow \infty} \tilde{u}_{\lambda_n}(\lambda_n^{1/2} r_0^{-1}) \leq U(r).$$

Letting $r \rightarrow \infty$ we obtain

$$0 \leq \overline{\lim}_{n \rightarrow \infty} \sup_{\Omega'} |\underline{u}_{\lambda_n}(x)| \leq 0.$$

This contradicts to (3.12). The proofs of (3) and Theorem 1.3 are completed. $\square$

From the proof of Theorem 1.3, we can obtain the following corollary.

Corollary 3.6. *Suppose that the all conditions of Theorem 1.3 hold and let (u_λ, v_λ) be a solutions to (P_λ) such that $u_\lambda \neq U_\lambda$ for all sufficiently large $\lambda > 0$. Then the same results of Theorem 1.3 hold.*

4 Open questions

By Theorem 1.2 and 1.3, we obtained the asymptotic profiles of variational solutions at least for the case $\Omega = B_R(0)$ is a ball. However, in order to understand the complete dynamics of solutions for (D_λ) , the following problems still remain:

(Q1) Linearized stability of solutions.

(Q2) Exact multiplicity of solutions.

(Q3) Asymptotic profile of the mountain pass solution when Ω is not ball.

At first we state about Problem (Q1). In Reinecke and Sweers [20], linearized stability is considered in the space $X := C(\bar{\Omega}) \times C(\bar{\Omega})$. First we define the linearized operator $A_\lambda(U, V) : D(A_\lambda(U, V)) \subset X \rightarrow X$ around the solution (U, V) to (P_λ) is given by

$$\begin{cases} A_\lambda(U, V) \begin{pmatrix} u \\ v \end{pmatrix} := \begin{pmatrix} -\Delta & 0 \\ 0 & -\Delta \end{pmatrix} \begin{pmatrix} u \\ v \end{pmatrix} - \lambda \begin{pmatrix} f'(U) & -1 \\ \delta & -\gamma \end{pmatrix} \begin{pmatrix} u \\ v \end{pmatrix}, \\ D(A_\lambda) := \{(u, v) \in X \mid u = v = 0 \text{ on } \partial\Omega, (\Delta u, \Delta v) \in X\}, \end{cases}$$

where in the definition of $D(A_\lambda)$, Δu and Δv are to be understood in distributional sense. If the spectrum $\sigma(A_\lambda(U, V))$ is contained in $\{\nu \in \mathbb{C} \mid \operatorname{Re} \nu \geq 0\}$ the solution (U, V) to (P_λ) is called linearly stable and $\sigma(A_\lambda(U, V)) \cap \{\nu \in \mathbb{C} \mid \operatorname{Re} \nu < 0\} \neq \emptyset$ then (U, V) is called linearly unstable. In Reinecke and Sweers [20] it is shown that the boundary layer solution (U_λ, V_λ) is linearly stable, that is, the following results holds.

Proposition 4.1. ([20], Theorem 2.2) *Assume that the all conditions (C1), (C2), (C3) hold and let λ^* and Λ be as in Theorem 2.11. For every $\lambda \geq \lambda^*$ the solution $\Lambda(\lambda) = (U_\lambda, V_\lambda)$ to (P_λ) is linearly (exponentially) stable stationary solution to the initial value problem (D_λ) i.e., for every $\lambda \geq \lambda^*$ there exists $\nu_\lambda > 0$ such that the spectrum $\sigma(A_\lambda(U_\lambda, V_\lambda))$ is contained in $\{\nu \in \mathbb{C} \mid \operatorname{Re} \nu > \nu_\lambda\}$.*

Hence by the Theorem 1.2, the global minimizer is linearly stable for sufficiently large $\lambda > 0$. However, the linearized stability of the mountain pass solution is not yet known, although we believe that a mountain pass solution is linearly unstable.

Next about Problem (Q2), in the scalar case (S_λ) , if Ω is ball it is shown that there exists $\lambda_0 > 0$ such that for $\lambda > \lambda_0$, the problem (S_λ) has exactly two positive solutions, exactly one nontrivial solution for $\lambda = \lambda_0$ and no solution for $\lambda < \lambda_0$ (see [16]). Taking into account that the quasimonotone system would have similar properties as in the scalar equation, we can expect that problem (P_λ) has exact two nontrivial solutions in our parameter range. Especially, Gardner and Peletier [8] have shown that the problem (S_λ) has exactly two solutions for sufficiently large $\lambda > 0$. In [8], the exact multiplicity of solutions was investigated based on the uniqueness of positive radially symmetric solutions of the problem:

$$(S) \begin{cases} -\Delta u = f(u) & \text{in } \mathbb{R}^N, \\ u(x) \rightarrow 0 & \text{as } |x| \rightarrow \infty, \end{cases}$$

(see Peletier and Serrin [17]). Hence when considering Problem (Q2), it would be necessary to consider the uniqueness of positive radially symmetric solutions for the problem

$$(P) \begin{cases} -\Delta u = f(u) - v & \text{in } \mathbb{R}^N, \\ -\Delta v = \delta u - \gamma v & \text{in } \mathbb{R}^N, \\ u(x) \rightarrow 0 & \text{as } |x| \rightarrow \infty, \\ v(x) \rightarrow 0 & \text{as } |x| \rightarrow \infty. \end{cases}$$

simultaneously. We believe that the solution to (P) is unique at least for small $\delta > 0$. However, it seems no result for the uniqueness of positive radially symmetric solution to (P) as far as we know.

Finally about Problem (Q3), when Ω is general domain, the asymptotic profile of the mountain pass solution is not yet known. We believe that a mountain pass solution has a spiky profile when Ω is convex as the result about the scalar case in [11].
