Abstract

The asymptotic estimate of the gamma function $|\Gamma(x+iy)|$ when $|y|$ tends to infinity is proved. The result gives a more precise one of the known formula.

KEY WORDS: gamma function, asymptotic estimate
MSC (2000): 33B15, 30E15

Let $\Gamma(z)$ be the gamma function of complex argument $z = x + iy$ ($x, y \in \mathbb{R} = (-\infty, \infty)$) (see [1, Chapter 1]). It is known [1, 1.18(2)] the following asymptotic formula of $\Gamma(z)$ at infinity:

$$\Gamma(z) = \sqrt{2\pi} e^{-z} e^{(z-1/2)\log z} \left[1 + O\left(\frac{1}{z}\right) \right] \quad (|z| \rightarrow \infty, |\arg(z)| < \pi), \quad (1)$$

which is called Stirling formula. As a corollary of this result, in [1, 1.18(6)] the asymptotic relation for $|\Gamma(x+iy)|$, as $|y| \rightarrow \infty$, is presented in the form

$$\lim_{|y| \rightarrow \infty} |\Gamma(x+iy)| e^{|y|\pi/2} |y|^{1/2-x} = \sqrt{2\pi}. \quad (2)$$

This relation needs in correction, namely the multiplier e^{-x} must be added:

$$\lim_{|y| \rightarrow \infty} |\Gamma(x+iy)| e^{|y|\pi/2} |y|^{1/2-x} = \sqrt{2\pi} e^{-x}. \quad (3)$$

This result follows from the following assertion.

Theorem. For fixed $x \in \mathbb{R}$ there holds the following asymptotic estimate for $|\Gamma(x + iy)|$ at infinity:

$$|\Gamma(x + iy)| = \sqrt{2\pi} |y|^{x-1/2} e^{-x-|y|\pi/2} \left[1 + O\left(\frac{1}{|y|}\right) \right] \quad (|y| \rightarrow \infty). \quad (4)$$

Proof. Put $z = x + iy \in \mathbb{C}$ and fix the real part x . From (1) we have, as $|y| \rightarrow \infty$,

$$|\Gamma(x + iy)| = (2\pi)^{1/2} \left| e^{-x-iy} e^{(x-1/2+iy)[\log|x+iy|+i\arg(x+iy)]} \right| \left[1 + O\left(\frac{1}{x+iy}\right) \right]$$

or

$$|\Gamma(x + iy)| = (2\pi)^{1/2} e^{-x} e^{(x-1/2)\log|x+iy|} e^{-y\arg(x+iy)} \left[1 + O\left(\frac{1}{x+iy}\right) \right]. \quad (5)$$

Estimating more precisely the terms in (5), when $|y| \rightarrow \infty$, we have

$$\begin{aligned} e^{(x-1/2)\log|x+iy|} &= e^{(x-1/2)\log|y|} e^{\{(x-1/2)/2\}\log(1+x^2/y^2)} \\ &= |y|^{x-1/2} \left(1 + \frac{|x|^2}{|y|^2} \right)^{(x-1/2)/2} \end{aligned}$$

and the last relation means

$$e^{(x-1/2)\log|x+iy|} = |y|^{x-1/2} \left[1 + O\left(\frac{1}{|y|^2}\right) \right] \quad (|y| \rightarrow \infty). \quad (6)$$

Further, since $\arg(x + iy) \rightarrow \pi/2$ as $y \rightarrow \infty$ and $\arg(x + iy) \rightarrow -\pi/2$ as $y \rightarrow -\infty$, the term $e^{-y\arg(x+iy)}$ can be represented as

$$e^{-y\arg(x+iy)} = e^{-|y|\pi/2} e^{-|y|[\arg(x+iy)\text{sign}(y)-\pi/2]}.$$

It follows from the l'Hospital rule that

$$e^{-|y|[\arg(x+iy)\text{sign}(y)-\pi/2]} = 1 + O\left(\frac{1}{|y|}\right) \quad (|y| \rightarrow \infty),$$

and hence

$$e^{-y\arg(x+iy)} = e^{-|y|\pi/2} \left[1 + O\left(\frac{1}{|y|}\right) \right] \quad (|y| \rightarrow \infty). \quad (7)$$

Finally, if $|y| \rightarrow \infty$, then $|x + iy| \sim |y|$, and hence

$$O\left(\frac{1}{x+iy}\right) = O\left(\frac{1}{|y|}\right) \quad (|y| \rightarrow \infty). \quad (8)$$

Substituting (6), (7) and (8) into (5), we obtain (4). This completes the proof of theorem.

Corollary 1. For fixed $x \in \mathbb{R}$ there holds the asymptotic estimate (3) for $|\Gamma(x + iy)|$ at infinity, which is equivalent to the relation

$$|\Gamma(x + iy)| \sim (2\pi)^{1/2} |y|^{x-1/2} e^{-x-|y|\pi/2} \quad (|y| \rightarrow \infty). \quad (9)$$

Remark 1. The estimate (9) was indicated in our paper [2, the relation (2.2)].

Let $\mathbb{N}$ be the set of natural numbers and $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$. Taking $x = -k$ ($k \in \mathbb{N}_0$) in Theorem, we obtain the following assertion.

Corollary 2. If $k \in \mathbb{N}_0$ is fixed, then there holds the estimate

$$|\Gamma(-k + iy)| = (2\pi)^{1/2} |y|^{-k-1/2} e^{k-|y|\pi/2} \left[1 + O\left(\frac{1}{|y|}\right) \right] \quad (|y| \rightarrow \infty). \quad (10)$$

In particular, for $k = 0$

$$|\Gamma(iy)| = (2\pi)^{1/2} |y|^{-1/2} e^{-|y|\pi/2} \left[1 + O\left(\frac{1}{|y|}\right) \right] \quad (|y| \rightarrow \infty). \quad (11)$$

Corollary 3. If $k \in \mathbb{N}_0$ is fixed and $n \in \mathbb{N}$, then there holds the estimate

$$|\Gamma(-k \pm in)| = (2\pi)^{1/2} n^{-k-1/2} e^{k-n\pi/2} \left[1 + O\left(\frac{1}{n}\right) \right] \quad (n \rightarrow \infty). \quad (12)$$

In particular, for $k = 0$

$$|\Gamma(\pm in)| \sim (2\pi)^{1/2} n^{-1/2} e^{-n\pi/2} \left[1 + O\left(\frac{1}{n}\right) \right] \quad (n \rightarrow \infty). \quad (13)$$

Remark 2. It is known (see, for example, [3, (3.39)]) that the gamma function has the following asymptotic near the poles $z = -k$ ($k \in \mathbb{N}_0$)

$$\Gamma(z) = \frac{(-1)^k}{k!(z+k)} \left[1 + O\left(\frac{1}{z}\right) \right] \quad (z \rightarrow -k, k \in \mathbb{N}_0). \quad (14)$$

The relation (10) yields the asymptotic estimate of $|\Gamma(z)|$ at infinity on the line parallel to the imaginary axis $z = -k + iy$ ($k \in \mathbb{N}_0$) and, in particular, (11) gives the asymptotic estimate of $|\Gamma(z)|$ on the imaginary axis $z = iy$.

Remark 3. It is well known that

$$\Gamma(n) = (n-1)! \quad (n \in \mathbb{N}_0). \quad (15)$$

Then (14) and (15) yield different asymptotic behaviors of $|\Gamma(z)|$ as $z \rightarrow -n$ and $z \rightarrow n$ ($n \in \mathbb{N}$) at the positive and negative integers:

$$|\Gamma(z)| \sim \frac{1}{n!|z+n|} \quad (z \rightarrow -n; n \in \mathbb{N}); \quad |\Gamma(z)| \sim (n-1)! \quad (z \rightarrow n; n \in \mathbb{N}). \quad (16)$$

On the other hand, (13) gives the same asymptotic estimates for $|\Gamma(z)|$ as $z \rightarrow -in$ and $z \rightarrow in$ ($n \in \mathbb{N}$) on the imaginary axis

$$|\Gamma(z)| \sim (2\pi)^{1/2} n^{-1/2} e^{-n\pi/2} \quad (z \rightarrow \pm in; n \in \mathbb{N}). \quad (17)$$

Moreover, the relation (9) show that $|\Gamma(x+iy)|$ for fixed $x \in \mathbb{R}$ has the same forms as $y \rightarrow -\infty$ and $y \rightarrow +\infty$

$$|\Gamma(x+iy)| \sim (2\pi)^{1/2} |y|^{x-1/2} e^{-x-|y|\pi/2} \quad (y \rightarrow \pm\infty). \quad (18)$$
