1 Introduction and Main Results

In this paper, we consider the following boundary value problem:

$$(P_\varepsilon) \begin{cases} -\varepsilon^2 \Delta u = h(|x|)^2(u - a(|x|))(1 - u^2) & \text{in } B_1(0) \\ \frac{\partial u}{\partial \nu} = 0 & \text{on } \partial B_1(0) \end{cases}$$

where $\varepsilon > 0$ is a small parameter, $B_1(0)$ is a unit ball in $\mathbb{R}^N$ centered at the origin and the function a is a C^1 function on $[0, 1]$ satisfying $-1 < a(|x|) < 1$ and $a'(0) = 0$. The function h is a positive C^1 function on $[0, 1]$ satisfying $h'(0) = 0$. We set $r = |x|$.

Problem (P_ε) appears in various models such as population genetics, chemical reactor theory and phase transition phenomena. See [1] and the references therein. If the function h satisfies $h(r) \equiv 1$ and the function a satisfies $a(r) \not\equiv 0$, then this problem (P_ε) has been studied in [1], [4] and [7]. In this case, it is shown that there exist radially symmetric solutions with transition layers near the set $\{x \in B_1(0) | a(|x|) = 0\}$. If the set $\{r \in \mathbb{R} | a(r) = 0\}$ contains an interval I , then the problem to decide the configuration of transition layer on I is more delicate.

On the other hand, in the case of $N = 1$, if the function h satisfies $h(r) \not\equiv 1$ and the function a satisfies $a(r) \equiv 0$, then this problem (P_ε) has been studied in [8] and [9]. In this case, it is shown that there exist stable solutions with transition layers near prescribed local minimum points of h .

In this paper, we consider the case where the function a satisfies $a(r) \not\equiv 0$ with $a(r) = 0$ on some interval $I \subset (0, 1)$. We show the minimum point of the function $r^{N-1}h(r)$ on I has very important role to decide the configuration of transition layer on I in this case.

We note that in [4], Dancer and Shusen Yan considered a problem similar to ours. They assume that $N \geq 2$, $h \equiv 1$ and the nonlinear term is $u(u - a|x|)(1 - u)$ satisfying $a(r) = 1/2$ on $I = [l_1, l_2]$ and $a(r) < 1/2$ for $l_1 - r > 0$ small and $a(r) > 1/2$ for $r - l_2 > 0$ small, then a global minimizer of the corresponding functional has a transition layer near the l_1 , that is, the minimum point of r^{N-1} on I (see [4, Theorem 1.3]). In this sense, we can say that our results are natural extension of the results in [4]. We are going to follow throughout the variational

procedure used in [4] with a few modifications prompted by the presence of the function h .

Here we state the energy functional corresponding to (P_ε) :

$$J_\varepsilon(u) = \int_{B_1(0)} \frac{\varepsilon^2}{2} |\nabla u|^2 - F(|x|, u) dx,$$

where $F(|x|, u) = \int_{-1}^u f(|x|, s) ds$ and $f(|x|, u) = h(|x|)^2(u - a(|x|))(1 - u^2)$.

It is easy to see that the following minimization problem has a minimizer

$$\inf\{J_\varepsilon(u) | u \in H^1(B_1(0))\}. \quad (1.1)$$

Let $A_- = \{x \in B_1(0) | a(|x|) < 0\}$ and $A_+ = \{x \in B_1(0) | a(|x|) > 0\}$.

In this paper, we will analyze the profile of the minimizer of (1.1). Our main theorem is the following:

Theorem 1.1. *Let u_ε be a global minimizer of (1.1). Then u_ε is radially symmetric and*

$$u_\varepsilon \rightarrow \begin{cases} 1 & , \text{uniformly on any compact subset of } A_-, \\ -1 & , \text{uniformly on any compact subset of } A_+, \end{cases}$$

as $\varepsilon \rightarrow 0$. In particular u_ε converges uniformly near the boundary of $B_1(0)$, that is, if $a(r) < 0$ on $[r_0, 1]$ for some $r_0 > 0$, $u_\varepsilon \rightarrow 1$ uniformly on $\overline{B_1(0)} \setminus B_{r_0}(0)$ and if $a(r) > 0$ on $[r_0, 1]$ for some $r_0 > 0$, $u_\varepsilon \rightarrow -1$ uniformly on $\overline{B_1(0)} \setminus B_{r_0}(0)$. Moreover, for any $0 < r_1 \leq r_2 < 1$ with $a(r_i) = 0$, $i = 1, 2$, $a(r) \neq 0$ for $r_1 - r > 0$ small and for $r - r_2 > 0$ small, $a(r) = 0$ if $r \in [r_1, r_2]$, we have:

- (i) *If $a(r) < 0$ for $r_1 - r > 0$ small and $a(r) > 0$ for $r - r_2 > 0$, then for any small $\eta > 0$ and for any small $\theta > 0$, there exists a positive number ε_0 which has the following properties: For any $\varepsilon \in (0, \varepsilon_0]$, there exist $t_{\varepsilon,1} < t_{\varepsilon,2}$ such that*

(a)

$$\begin{cases} u_\varepsilon(r) > 1 - \eta & \text{for } r \in [r_1 - \theta, t_{\varepsilon,1}), \\ u_\varepsilon(t_{\varepsilon,1}) = 1 - \eta, \\ u_\varepsilon(t_{\varepsilon,2}) = -1 + \eta, \\ u_\varepsilon(r) < -1 + \eta, & \text{for } r \in (t_{\varepsilon,2}, r_2 + \theta]. \end{cases}$$

(b) *The function $u_\varepsilon(r)$ is decreasing in $(t_{\varepsilon,1}, t_{\varepsilon,2})$*

(c) *The inequality $0 < R_1 \leq \frac{t_{\varepsilon,2} - t_{\varepsilon,1}}{\varepsilon} \leq R_2$ holds, where R_1 and R_2 are two constants independent of $\varepsilon > 0$.*

(d) *If $t_{\varepsilon_j,1}, t_{\varepsilon_j,2} \rightarrow \bar{t}$ for some positive sequence $\{\varepsilon_j\}$ converging to zero as $j \rightarrow \infty$, then $\bar{t}$ satisfies $h(\bar{t})\bar{t}^{N-1} = \min_{s \in [r_1, r_2]} h(s)s^{N-1}$.*

- (ii) If $a(r) > 0$ for $r_1 - r > 0$ small and $a(r) < 0$ for $r - r_2 > 0$, then for any small $\eta > 0$ and for any small $\theta > 0$, there exists a positive number ε_0 which has the following properties: For any $\varepsilon \in (0, \varepsilon_0]$, there exist $t_{\varepsilon,1} < t_{\varepsilon,2}$ such that

(a)

$$\begin{cases} u_\varepsilon(r) < -1 + \eta & \text{for } r \in [r_1 - \theta, t_{\varepsilon,1}), \\ u_\varepsilon(t_{\varepsilon,1}) = -1 + \eta, \\ u_\varepsilon(t_{\varepsilon,2}) = 1 - \eta, \\ u_\varepsilon(r) > 1 - \eta, & \text{for } r \in (t_{\varepsilon,2}, r_2 + \theta]. \end{cases}$$

- (b) The function $u_\varepsilon(r)$ is increasing in $(t_{\varepsilon,1}, t_{\varepsilon,2})$.
(c) The inequality $0 < R_1 \leq \frac{t_{\varepsilon,2} - t_{\varepsilon,1}}{\varepsilon} \leq R_2$ holds, where R_1 and R_2 are two constants independent of $\varepsilon > 0$.
(d) If $t_{\varepsilon,1}, t_{\varepsilon,2} \rightarrow \bar{t}$ for some positive sequence $\{\varepsilon_j\}$ converging to zero as $j \rightarrow \infty$, then $\bar{t}$ satisfies $h(\bar{t})\bar{t}^{N-1} = \min_{s \in [r_1, r_2]} h(s)s^{N-1}$.

Fig 1: The profile of the global minimizer u_ε .

Remarks . (i) We note that results from (a) to (c) both in cases (i) and (ii) are not related to the presence of the function h . The effect of presence of function h appears in the result (d) in (i) and (ii).

- (ii) If $\min_{s \in [r_1, r_2]} s^{N-1}h(s)$ is attained at a unique point $\bar{t}$, we can show $t_{\varepsilon,1}, t_{\varepsilon,2} \rightarrow \bar{t}$ as $\varepsilon \rightarrow 0$ without taking subsequences.
(iii) If the function $r^{N-1}h(r)$ is constant on $[r_1, r_2]$, it is a very difficult problem to know the location of the point $\bar{t} \in [r_1, r_2]$.

This paper is organized as follows. In section 2, we prepare some preliminary results. We will prove Theorems 1.1 in section 3.

2 Preliminary Results

In this section we prepare some preliminary results.

Let D is a bounded domain in $\mathbb{R}^N$. Let $\bar{f}(x, t)$ be a function defined on $\bar{D} \times \mathbb{R}$ which is bounded on $\bar{D} \times [-1, 1]$. Suppose $\bar{f}$ is continuous on $t \in \mathbb{R}$ for each $x \in \bar{D}$ and is measurable in D for each $t \in \mathbb{R}$. We also assume

$$\bar{f}(x, t) > 0 \text{ for } x \in \bar{D}, t < -1; \bar{f}(x, t) < 0, \text{ for } x \in \bar{D}, t > 1. \quad (2.1)$$

Consider the following minimization problem:

$$\inf \left\{ \bar{J}_\varepsilon(u, D) := \int_D \frac{\varepsilon^2}{2} |\nabla u|^2 - \bar{F}(x, u) dx : u - \eta \in H_0^1(D) \right\}, \quad (2.2)$$

where $\eta \in H^1(D)$ with $-1 \leq \eta \leq 1$ on D and

$$\bar{F}(x, t) = \int_{-1}^t \bar{f}(x, s) ds.$$

We can prove next two lemmas by methods similar to [4]. For readers's convenience we prove these lemmas in this section.

Lemma 2.1. *Suppose that $\bar{f}(x, t)$ satisfies (2.1). Let u_ε be a minimizer of (2.2). Then $-1 \leq u_\varepsilon \leq 1$ on D .*

Proof. We prove $-1 \leq u_\varepsilon$ on D . Let $M = \{x : u_\varepsilon(x) < -1\}$. Define $\tilde{u}_\varepsilon$ as follows:

$$\tilde{u}_\varepsilon(x) = \begin{cases} u_\varepsilon(x) & \text{if } x \in D \setminus M \\ -1 & \text{if } x \in M. \end{cases}$$

Since $u_\varepsilon(x) = \eta \geq -1$ on ∂D , we see M is compactly contained in D . Thus $\tilde{u}_\varepsilon - \eta \in H_0^1(D)$. If the measure $m(M)$ of M is positive, we have $\bar{J}_\varepsilon(\tilde{u}_\varepsilon, D) < \bar{J}_\varepsilon(u_\varepsilon, D)$. Because u_ε is a minimizer, we see $m(M) = 0$, where $m(A)$ denotes the Lebesgue measure of the set A . Thus $u_\varepsilon \geq -1$. Similarly we can prove that $u_\varepsilon \leq 1$. $\square$

Lemma 2.2. *Suppose that $\bar{f}_1(x, t)$ and $\bar{f}_2(x, t)$ both satisfy (2.1) and the same regularity assumption on $\bar{f}$. Assume that $\eta_i \in H^1(D)$ satisfy $-1 \leq \eta_i \leq 1$ on D for $i = 1, 2$. Let $u_{\varepsilon, i}$ be a corresponding minimizer of (2.2), where $\bar{f} = \bar{f}_i$ and $\eta = \eta_i$, $i = 1, 2$. Suppose that $\bar{f}_1(x, t) \geq \bar{f}_2(x, t)$ for all $(x, t) \in \bar{D} \times [-1, 1]$ and $1 \geq \eta_1 \geq \eta_2 \geq -1$. Then $u_{\varepsilon, 1} \geq u_{\varepsilon, 2}$.*

Proof. Let $M = \{x \in D : u_{\varepsilon, 2} > u_{\varepsilon, 1}\}$. Define $\varphi_\varepsilon = (u_{\varepsilon, 2} - u_{\varepsilon, 1})^+$. Since $\eta_1 \geq \eta_2$, we have $\varphi_\varepsilon \in H_0^1(D)$. Set $\bar{F}_i(x, u) = \int_{-1}^u \bar{f}_i(x, s) ds$. Since $u_{\varepsilon, i}$ is a minimizer of

$$J_{\varepsilon, i}(u) := \int_D \frac{\varepsilon^2}{2} |\nabla u|^2 - \bar{F}_i(x, u) dx$$

and $\varphi_\varepsilon = 0$ for $x \in D \setminus M$, we have

$$\begin{aligned}
0 &\leq J_{\varepsilon,1}(u_{\varepsilon,1} + \varphi_\varepsilon) - J_{\varepsilon,1}(u_{\varepsilon,1}) \\
&= \int_M \frac{\varepsilon^2}{2} (|\nabla(u_{\varepsilon,1} + \varphi_\varepsilon)|^2 - |\nabla u_{\varepsilon,1}|^2) dx - \int_M \int_{u_{\varepsilon,1}}^{u_{\varepsilon,1} + \varphi_\varepsilon} \bar{f}_1(x, s) ds \\
&\leq \int_M \frac{\varepsilon^2}{2} (|\nabla(u_{\varepsilon,1} + \varphi_\varepsilon)|^2 - |\nabla u_{\varepsilon,1}|^2) dx - \int_M \int_{u_{\varepsilon,1}}^{u_{\varepsilon,1} + \varphi_\varepsilon} \bar{f}_2(x, s) ds \\
&= J_{\varepsilon,2}(u_{\varepsilon,2}) - J_{\varepsilon,2}(u_{\varepsilon,2} - \varphi_\varepsilon) \leq 0.
\end{aligned}$$

This implies that $u_{\varepsilon,1} + \varphi_\varepsilon$ is also a minimizer of $J_{\varepsilon,1}(u)$. Let $L > 0$ be large enough such that $\bar{f}_1(x, t) + Lt$ is strictly increasing for $x \in \bar{D}$, $t \in [-1, 1]$. From

$$-\varepsilon^2 \Delta(u_{\varepsilon,1} + \varphi_\varepsilon) = \bar{f}_1(u_{\varepsilon,1} + \varphi_\varepsilon),$$

we obtain

$$-\varepsilon^2 \Delta \varphi_\varepsilon = \bar{f}_1(u_{\varepsilon,1} + \varphi_\varepsilon) - \bar{f}_1(u_{\varepsilon,1}).$$

Thus

$$-\varepsilon^2 \Delta \varphi_\varepsilon + L \varphi_\varepsilon = \bar{f}_1(u_{\varepsilon,1} + \varphi_\varepsilon) + L(u_{\varepsilon,1} + \varphi_\varepsilon) - (\bar{f}_1(u_{\varepsilon,1}) + L u_{\varepsilon,1}) > 0$$

in D . Fix $z_0 \in M$. Let $x_0 \in \partial M$ such that $|x_0 - z_0| = \text{dist}(z_0, \partial M)$. Using the Strong maximum principle and Hopf's lemma in $B_{\text{dist}(z_0, \partial M)}(z_0)$, we obtain that $\frac{\partial \varphi_\varepsilon}{\partial \nu}(x_0) < 0$, where $\nu = (x_0 - z_0)/|x_0 - z_0|$. But $\varphi_\varepsilon(x) = 0$ for $x \notin M$. Thus, $\frac{\partial \varphi_\varepsilon}{\partial \nu}(x_0) = 0$. This is a contradiction. Thus we obtain $M = \emptyset$. $\square$

3 Proof of Main Theorem

In this section we prove Theorem 1.1. The following proposition is the first part of Theorem 1.1.

Proposition 3.1. *Let u_ε be a global minimizer of the problem (1.1). Then u_ε satisfies*

$$u_\varepsilon \rightarrow \begin{cases} 1 & \text{uniformly on any compact subset of } A_- \\ -1 & \text{uniformly on any compact subset of } A_+ \end{cases}$$

as $\varepsilon \rightarrow 0$.

Proof. Let $x_0 \in A_-$. Choose $\delta > 0$ small so that $B_\delta(x_0) \subset\subset A$. Take $b \in (\max_{z \in \bar{B}_\delta(x_0)} a(z), 1/2)$. Define $f_{x_0, \delta, b}(t) = (\min_{z \in B_\delta(x_0)} h(z)^2)(t - b)(1 - t^2)$. Then for $x \in \bar{B}_\delta(x_0)$, $t \in [-1, 1]$, we have $f(|x|, t) \geq f_{x_0, \delta, b}(t)$. Let $u_{\varepsilon, x_0, \delta, b}$ be the minimizer of

$$\inf \left\{ \int_{B_\delta(x_0)} \frac{\varepsilon^2}{2} |\nabla u|^2 - F_{x_0, \delta, b}(u) dx : u + 1 \in H_0^1(B_\delta(x_0)) \right\},$$

where $F_{x_0, \delta, b}(t) = \int_{-1}^t f_{x_0, \delta, b}(s) ds$. It follows from Lemmas 2.1 and 2.2 that

$$u_{\varepsilon, x_0, \delta, b}(x) \leq u_{\varepsilon}(x) \leq 1, \text{ for } x \in B_{\delta}(x_0).$$

Since $\int_{-1}^1 f_{x_0, \delta, b}(s) ds > 0$, it follows from [2, 3] that $u_{\varepsilon, x_0, \delta, b}(x) \rightarrow 1$ as $\varepsilon \rightarrow 0$ uniformly in $B_{\delta/2}(x_0)$, thus $u_{\varepsilon}(x) \rightarrow 1$ as $\varepsilon \rightarrow 0$ uniformly in $B_{\delta/2}(x_0)$. $\square$

To prove the rest of Theorem 1.1, we need the following proposition and lemma.

Proposition 3.2. *Let u be a local minimizer of the following problem:*

$$\inf \left\{ \int_{B_1(0)} \frac{1}{2} |\nabla u|^2 - G(|x|, u) dx : u \in H^1(B_1(0)) \right\}.$$

Here $G(r, t) = \int_{-1}^t g(r, s) ds$, $g(r, t)$ is C^1 in $t \in \mathbb{R}$ for each $r \geq 0$, $g(r, t)$ and $g_t(r, t)$ are measurable on $[0, +\infty)$ for each $t \in \mathbb{R}$, $g(r, t) < 0$ if $t < -1$ or $t > 1$ and $|g(r, t)| + |g_t(r, t)|$ is bounded on $[0, k] \times [-2, 2]$ for any $k > 0$. Then u is radial, i.e., $u(x) = u(|x|)$.

Proof. See [4, Proposition 2.6]. $\square$

Before we prove Theorem 1.1, we prepare a lemma.

Lemma 3.3. *Let $0 < \eta < 1$ be any fixed constant and w satisfies*

$$\begin{cases} -w_{zz} = w(1 - w^2) & \text{on } \mathbb{R}, \\ w(0) = -1 + \eta \text{ (resp. } w(0) = 1 - \eta), \\ w(z) \leq -1 + \eta \text{ (resp. } w(z) \geq 1 - \eta) & \text{for } z \leq 0, \\ w \text{ is bounded on } \mathbb{R}. \end{cases}$$

Then w is a unique solution of

$$\begin{cases} -w_{zz} = w(1 - w^2) & \text{on } \mathbb{R}, \\ w(0) = -1 + \eta \text{ (resp. } w(0) = 1 - \eta), \\ w'(z) > 0 \text{ (resp. } w'(z) < 0) & z \in \mathbb{R}, \\ w(z) \rightarrow \pm 1 \text{ (resp. } w(z) \rightarrow \mp 1) & \text{as } z \rightarrow \pm \infty. \end{cases}$$

Proof. See for example [6]. $\square$

Now we prove the rest of Theorem 1.1.

Proof of Theorem 1.1. For the sake of simplicity, we prove for the case where $a(r) < 0$ on $[0, r_1)$, $a(r) = 0$ on $[r_1, r_2]$ and $a(r) > 0$ on $(r_2, 1]$ for some $0 < r_1 < r_2 < 1$ (see Figure 1 in Section 1).

Part 1. First we show that u_{ε} converges uniformly near the boundary of $B_1(0)$, that is, $u_{\varepsilon} \rightarrow -1$ uniformly on $\overline{B_1(0)} \setminus B_{r_2+\tau}(0)$ for any small $\tau > 0$. We note that

we have $u_\varepsilon \rightarrow -1$ uniformly on $\overline{B_{1-\tau}(0)} \setminus B_{r_2+\tau}(0)$ as $\varepsilon \rightarrow 0$. Now we claim that $u_\varepsilon(r) \leq u_\varepsilon(1-\tau) =: T_\varepsilon$ for $r \in [1-\tau, 1]$. We define the function $\tilde{u}_\varepsilon$ as follows:

$$\tilde{u}_\varepsilon(r) = \begin{cases} u_\varepsilon(r) & \text{if } r \in [0, 1-\tau] \\ u_\varepsilon(r) & \text{if } u_\varepsilon(r) < T_\varepsilon \text{ and } r \in [1-\tau, 1], \\ T_\varepsilon & \text{if } u_\varepsilon(r) \geq T_\varepsilon \text{ and } r \in [1-\tau, 1]. \end{cases}$$

We note that $\tilde{u}_\varepsilon \in H^1(B_1(0))$ and $-F(r, T_\varepsilon) \leq -F(r, t)$ for $\varepsilon > 0$ and $|r-1|$ small and $t \geq T_\varepsilon$. Hence we obtain $J_\varepsilon(\tilde{u}_\varepsilon) < J_\varepsilon(u_\varepsilon)$ and we have a contradiction if we assume that the measure of the set $\{r \in [0, 1] | u_\varepsilon(r) > T_\varepsilon \text{ and } r \in [1-\tau, 1]\}$ is positive. Hence $-1 < u_\varepsilon(r) \leq T_\varepsilon$ and $u_\varepsilon \rightarrow -1$ uniformly on $\overline{B_1(0)} \setminus B_{r_2+\tau}(0)$.

Part 2. Next we remark that, by Proposition 3.2, u_ε is radially symmetric and we note that for any $t_2 > t_1$, u_ε is a minimizer of the following problem

$$\inf\{J_\varepsilon(u, B_{t_2}(0) \setminus \overline{B_{t_1}(0)}) : u - u_\varepsilon \in H_0^1(B_{t_2}(0) \setminus \overline{B_{t_1}(0)})\},$$

where

$$J_\varepsilon(u, M) = \int_M \frac{\varepsilon^2}{2} |\nabla u|^2 - F(|x|, u) dx$$

for any open set M . Let $m_{\varepsilon, t_1, t_2}$ be the minimum value of this minimization problem.

In this part we show that u_ε has exactly one layer near the interval $[r_1, r_2]$.

Step 2.1. First we estimate the energy of transition layer.

Let $\eta > 0$ and $\theta > 0$ be small numbers. Since $u_\varepsilon \rightarrow 1$ uniformly on $[0, r_1 - \theta]$ and $u_\varepsilon \rightarrow -1$ uniformly on $[r_2 + \theta, 1 - \theta]$, we can find $\bar{r}_\varepsilon \in (r_1 - \theta, r_2 + \theta)$ such that $u_\varepsilon(r) \geq 1 - \eta$ if $r \in [0, \bar{r}_\varepsilon]$, $u_\varepsilon(r) < 1 - \eta$ for $r - \bar{r}_\varepsilon > 0$ small. Let $\tilde{r}_\varepsilon > \bar{r}_\varepsilon$ be such that $u_\varepsilon(r) \leq \eta$ if $r \in [\tilde{r}_\varepsilon, 1 - \theta]$, $u_\varepsilon(r) > \eta$ for $\tilde{r}_\varepsilon - r > 0$ small. We may assume that $\bar{r}_\varepsilon \rightarrow \bar{r} \in [r_1, r_2]$ and $\tilde{r}_\varepsilon \rightarrow \tilde{r} \in [r_1, r_2]$

We employ the so-called blow-up argument. Let $v_\varepsilon(t) = u_\varepsilon(\varepsilon t + \bar{r}_\varepsilon)$. Then

$$-v_\varepsilon'' - \varepsilon \frac{N-1}{\varepsilon t + \bar{r}_\varepsilon} v_\varepsilon' = f(\varepsilon t + \bar{r}_\varepsilon, v_\varepsilon),$$

$-1 \leq v_\varepsilon \leq 1$ and $v_\varepsilon(0) = 1 - \eta$. Since $\bar{r}_\varepsilon \rightarrow \bar{r} \in [r_1, r_2]$, it is easy to see that $v_\varepsilon \rightarrow v$ in $C_{\text{loc}}^1(\mathbb{R})$ and

$$-v'' = h(\bar{r})^2(v - v^3), \quad t \in \mathbb{R}.$$

and $v(t) \geq 1 - \eta$ for $t \leq 0$. If we set $v(t) = V(h(\bar{r})t)$, the function $V(t)$ satisfies

$$\begin{cases} -V'' = V - V^3 & \text{on } \mathbb{R}, \\ V(0) = 1 - \eta, \\ V'(t) \geq 1 - \eta & t \leq 0. \end{cases} \quad (3.1)$$

Hence by Lemma 3.3, the function V is a unique solution for

$$\begin{cases} -V'' = V - V^3 & \text{on } \mathbb{R}, \\ V(0) = 1 - \eta, \\ V'(t) < 0 & t \leq 0, \\ V(t) \rightarrow \pm 1 & \text{as } t \rightarrow \mp \infty. \end{cases} \quad (3.2)$$

Thus, we can find an $R > 0$ large, such that $v(R) = \eta$. Since $v_\varepsilon \rightarrow v$ in $C_{\text{loc}}^1(\mathbb{R})$, we can find an $R_\varepsilon \in (R - 1, R + 1)$, such that $v'_\varepsilon(r) < 0$ if $r \in [0, R_\varepsilon]$ and $v_\varepsilon(R_\varepsilon) = -1 + \eta$. Hence $u'_\varepsilon(r) < 0$ if $r \in [\bar{r}_\varepsilon, \bar{r}_\varepsilon + \varepsilon R_\varepsilon]$ and $u_\varepsilon(\bar{r}_\varepsilon + \varepsilon R_\varepsilon) = -1 + \eta$. Then we have

$$\begin{aligned} & J_\varepsilon(u_\varepsilon, B_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}) \\ &= \omega_{N-1}(\bar{r}_\varepsilon^{N-1} + o_\varepsilon(1)) \int_{\bar{r}_\varepsilon}^{\bar{r}_\varepsilon + \varepsilon R_\varepsilon} \left(\frac{\varepsilon^2}{2} |u'_\varepsilon|^2 - F(t, u_\varepsilon) \right) dt \\ &= \omega_{N-1}(\bar{r}_\varepsilon^{N-1} + o_\varepsilon(1)) \varepsilon \int_0^{R_\varepsilon} \left(\frac{1}{2} |v'_\varepsilon|^2 - F(\varepsilon t + \bar{r}_\varepsilon, v_\varepsilon) \right) dt \\ &= \omega_{N-1}(\bar{r}_\varepsilon^{N-1} + o_\varepsilon(1)) (\beta_{h(\bar{r})} + O(\eta) + o_\varepsilon(1)) \varepsilon, \end{aligned} \quad (3.3)$$

where ω_{N-1} is the area of the unit sphere in $\mathbb{R}^N$, $o_\varepsilon(1) \rightarrow 0$ as $\varepsilon \rightarrow 0$, $\beta_{h(s)}$ is the positive value defined by

$$\begin{aligned} \beta_{h(s)} &= \int_{-\infty}^{+\infty} \left(\frac{1}{2} |w'_{h(s)}(t)|^2 + h(s)^2 \frac{(w_{h(s)}^2 - 1)^2}{4} \right) dt \\ &= h(s) \int_{-\infty}^{+\infty} \frac{1}{2} |V'(t)|^2 + \frac{(V(t)^2 - 1)^2}{4} dt \\ &= h(s) \beta_1 \end{aligned}$$

and $w_{h(s)}(t) = V(h(s)t)$ for $s \in [0, 1]$. We note that although the function V depends on η , the value

$$\beta_1 = \int_{-\infty}^{+\infty} \frac{1}{2} |V'(t)|^2 + \frac{(V(t)^2 - 1)^2}{4} dt$$

is independent of η .

Step 2.2. We claim u_ε has exactly one layer near the interval $[r_1, r_2]$. To show u_ε has exactly one layer near the interval $[r_1, r_2]$, it sufficient to prove the following claim:

Claim. $\tilde{r}_\varepsilon = \bar{r}_\varepsilon + \varepsilon R_\varepsilon$.

Suppose that the claim is not true. Then we can find a $t_\varepsilon > \bar{r}_\varepsilon + R_\varepsilon \varepsilon$ such that $u_\varepsilon(r) < -1 + \eta$ if $r \in (\bar{r}_\varepsilon + R_\varepsilon \varepsilon, t_\varepsilon)$, $u_\varepsilon(t_\varepsilon) = -1 + \eta$. Thus we can use the blow-up argument again at t_ε to deduce that there is a $\tilde{t}_\varepsilon = t_\varepsilon + \varepsilon \tilde{R}_\varepsilon$ with $u'_\varepsilon(r) > 0$ if

$r \in (t_\varepsilon, \tilde{t}_\varepsilon)$, $u_\varepsilon(\tilde{t}_\varepsilon) = 1 - \eta$. We may assume that $t_\varepsilon, \tilde{t}_\varepsilon \rightarrow \bar{t}$ as $\varepsilon \rightarrow 0$ for some $\bar{t} \in [r_2, r_3]$. Moreover

$$J_\varepsilon(u_\varepsilon, B_{\tilde{t}_\varepsilon}(0) \setminus \overline{B_{t_\varepsilon}(0)}) = \omega_{N-1}(t_\varepsilon^{N-1} + o_\varepsilon(1))(\beta_{h(\bar{t})} + O(\eta))\varepsilon + o_\varepsilon(1) \quad (3.4)$$

Now we claim $\tilde{t}_\varepsilon \geq r_1$. Suppose $\tilde{t}_\varepsilon < r_1$.

Let $F_a(t) = \int_{-1}^t (v-a)(1-v^2)dv$. Then for any $t > 0$ small and $s \in [-1+t, 1-t]$,

$$\begin{aligned} & F_a(1-t) - F_a(s) \\ &= F_0(1-t) - F_0(s) + F_a(1-t) - F_0(1-t) - F_a(s) + F_0(s) \\ &= \left[\frac{(v^2-1)^2}{4} \right]_s^{1-t} - a \int_s^{1-t} (1-v^2)dv \end{aligned} \quad (3.5)$$

Thus it follows from (3.5) that if $a < 0$ then

$$F_a(1-t) - F_a(s) > 0 \quad (3.6)$$

for $s \in [-1+t, 1-t]$. Define

$$\bar{u}_\varepsilon(r) := \begin{cases} 1 - \eta & r \in [\bar{r}_\varepsilon, \bar{r}_\varepsilon + R_\varepsilon \varepsilon] \cup [t_\varepsilon, \tilde{t}_\varepsilon], \\ -u_\varepsilon(r) & r \in [\bar{r}_\varepsilon + R_\varepsilon \varepsilon, t_\varepsilon]. \end{cases}$$

By the assumption that $\tilde{t}_\varepsilon < r_1$ and using (3.6), we see $F(r, u_\varepsilon) < F(r, \bar{u}_\varepsilon)$ if $r \in [\bar{r}_\varepsilon, \tilde{t}_\varepsilon]$. Hence, we obtain

$$J_\varepsilon(\bar{u}_\varepsilon, B_{\tilde{t}_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}) < J_\varepsilon(u_\varepsilon, B_{\tilde{t}_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}).$$

Thus we obtain a contradiction. Therefore we have that $\tilde{t}_\varepsilon \geq r_1$.

Since $a(r) \geq 0$ for $r \in [r_1, 1]$, we see $F(r, t) \leq F(r, -1) = 0$ if $r \in [r_1, 1]$. Since $u_\varepsilon(r) \in (-1, -1 + \eta)$ for $r \in [\bar{r}_\varepsilon + R_\varepsilon \varepsilon, t_\varepsilon]$, we have

$$\begin{aligned} m_{\varepsilon, \bar{r}_\varepsilon, \tilde{r}_\varepsilon} &= J_\varepsilon(\bar{u}_\varepsilon, B_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}) + J_\varepsilon(\bar{u}_\varepsilon, B_{\tilde{t}_\varepsilon}(0) \setminus \overline{B_{t_\varepsilon}(0)}) \\ &\quad + J_\varepsilon(\bar{u}_\varepsilon, B_{t_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}(0)}) + J_\varepsilon(\bar{u}_\varepsilon, B_{\tilde{r}_\varepsilon}(0) \setminus \overline{B_{\tilde{t}_\varepsilon}(0)}) \\ &\geq \omega_{N-1}(\bar{r}_\varepsilon^{N-1} \beta_{h(\bar{r})} \varepsilon + t_\varepsilon^{N-1} \beta_{h(\bar{t})} \varepsilon) + O(\eta \varepsilon) + o(\varepsilon) \\ &\quad + \inf \left\{ - \int_{B_{t_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}(0)}} F(r, w) : -1 \leq w \leq 1 + \eta \right\} \\ &\quad + \inf \left\{ - \int_{B_{\tilde{r}_\varepsilon}(0) \setminus \overline{B_{\tilde{t}_\varepsilon}(0)}} F(r, w) : -1 \leq w \leq 1 \right\} \\ &\geq \omega_{N-1}(\bar{r}_\varepsilon^{N-1} \beta_{h(\bar{r})} \varepsilon + t_\varepsilon^{N-1} \beta_{h(\bar{t})} \varepsilon) + O(\eta \varepsilon) + o(\varepsilon) \end{aligned} \quad (3.7)$$

Now we give an upper bound for $m_{\varepsilon, \bar{r}_\varepsilon, \tilde{r}_\varepsilon}$. Let $R > 0$ be such that $V(h(\bar{r})R) = \eta$, where V is a unique solution to (3.2). Define $\bar{u}_\varepsilon$ as follows:

$$\bar{u}_\varepsilon(r) := \begin{cases} V(h(\bar{r})\frac{r-\bar{r}_\varepsilon}{\varepsilon}) & r \in [\bar{r}_\varepsilon, \bar{r}_\varepsilon + \varepsilon R] \\ -1 + \eta - \frac{\eta}{\varepsilon}(r - \bar{r}_\varepsilon - \varepsilon R) & r \in [\bar{r}_\varepsilon + \varepsilon R, \bar{r}_\varepsilon + \varepsilon R + \varepsilon] \\ -1 & r \in [\bar{r}_\varepsilon + \varepsilon R + \varepsilon, \tilde{r}_\varepsilon - \varepsilon] \\ -1 + \frac{\eta}{\varepsilon}(r - \tilde{r}_\varepsilon + \varepsilon) & r \in [\tilde{r}_\varepsilon - \varepsilon, \tilde{r}_\varepsilon] \end{cases} \quad (3.8)$$

Now we note that $|F(r, t)| = O(\eta)$ for $r \in [\bar{r}_\varepsilon, \tilde{r}_\varepsilon]$ and $-1 \leq t \leq -1 + \eta$. Then we have

$$\begin{aligned} m_{\varepsilon, \bar{r}_\varepsilon, \tilde{r}_\varepsilon} &\leq J_\varepsilon(\bar{u}_\varepsilon, B_{\bar{r}_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}) \\ &\leq J_\varepsilon(\bar{u}_\varepsilon, B_{\bar{r}_\varepsilon + R\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}) + J_\varepsilon(\bar{u}_\varepsilon, B_{\bar{r}_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon - \varepsilon}(0)}) \\ &\quad + J_\varepsilon(\bar{u}_\varepsilon, B_{\bar{r}_\varepsilon - \varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon + \varepsilon R}(0)}) \\ &\leq \omega_{N-1} \bar{r}_\varepsilon^{N-1} (\beta_{h(\bar{r})} + O(\eta)) \varepsilon + o(\varepsilon) + O(\varepsilon \eta) + o(\varepsilon) \\ &= \omega_{N-1} \bar{r}_\varepsilon^{N-1} \beta_{h(\bar{r})} + O(\eta \varepsilon) + o(\varepsilon) \end{aligned} \quad (3.9)$$

By (3.7) and (3.9), we have

$$\omega_{N-1} (\bar{r}_\varepsilon^{N-1} \beta_{h(\bar{r})} + t_\varepsilon^{N-1} \beta_{h(\bar{t})}) \varepsilon \leq \omega_{N-1} \bar{r}_\varepsilon^{N-1} \beta_{h(\bar{r})} \varepsilon + O(\varepsilon \eta) + o(\varepsilon)$$

This is a contradiction. So we can conclude $\tilde{r}_\varepsilon = \bar{r}_\varepsilon + \varepsilon R_\varepsilon$.

Part 3. It remains to prove that if $\bar{r}_{\varepsilon_j} \rightarrow \bar{r}$ for some positive sequence $\{\varepsilon_j\}$ converging to zero as $j \rightarrow \infty$ then $\bar{r}$ satisfies

$$\bar{r}^{N-1} h(\bar{r}) = \min_{s \in [r_1, r_2]} s^{N-1} h(s).$$

Step 3.1. First we note that from Part 1, the function u_ε satisfies $-1 \leq u_\varepsilon \leq -1 + \eta$ for $r \in [\bar{r}_\varepsilon + \varepsilon R_\varepsilon, 1]$ in this case.

Step 3.2. Set $H(s) = s^{N-1} h(s)$. Assume that the result is not true. Then there exists a subsequence of $\{\bar{r}_\varepsilon\}$ (denoted by $\bar{r}_\varepsilon$) such that $\bar{r}_\varepsilon \rightarrow r' \in [r_1, r_2]$ and $H(r') > \min_{s \in [r_1, r_2]} H(s)$. Then we can find a point $\bar{t} \in (r_1, r_2)$ such that $H(r') > H(\bar{t})$.

Next we give a lower estimate for $J_\varepsilon(u_\varepsilon)$. We have

$$\begin{aligned} J_\varepsilon(u_\varepsilon) &= J_\varepsilon(u_\varepsilon, B_{\bar{r}_\varepsilon}(0)) + J_\varepsilon(u_\varepsilon, B_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}(0) \setminus \overline{B_{\bar{r}_\varepsilon}(0)}) \\ &\quad + J_\varepsilon(u_\varepsilon, B_1(0) \setminus \overline{B_{\bar{r}_\varepsilon + R_\varepsilon \varepsilon}(0)}). \end{aligned} \quad (3.10)$$

First we note that $1 - \eta \leq u_\varepsilon(r) \leq 1$ for $r \leq \bar{r}_\varepsilon$ and for sufficiently small $\eta > 0$, $-F(r, u) \geq -F(r, 1)$ ($u \in [1 - \eta, 1]$). We also remark that since $a(r) < 0$ for $r < r_1$ and $a(r) = 0$ for $r_1 \leq r \leq r_2$ and $a(r) > 0$ for $r > r_2$, we have $-F(r, 1) < 0$ for

$r < r_1$ and $-F(r, 1) = 0$ for $r_1 \leq r \leq r_2$ and $-F(r, 1) > 0$ for $r > r_2$. Hence we have $-\int_{r_1}^{\bar{r}_\varepsilon} r^{N-1} F(r, 1) dr \geq 0$ and we obtain the following estimate

$$\begin{aligned} J_\varepsilon(u_\varepsilon, B_{\bar{r}_\varepsilon}(0)) &\geq -\int_0^{\bar{r}_\varepsilon} r^{N-1} F(r, u_\varepsilon) dr \\ &\geq -\int_0^{\bar{r}_\varepsilon} r^{N-1} F(r, 1) dr \\ &= -\int_0^{r_1} r^{N-1} F(r, 1) dr - \int_{r_1}^{\bar{r}_\varepsilon} r^{N-1} F(r, 1) dr \\ &\geq -\int_0^{r_1} r^{N-1} F(r, 1) dr =: A. \end{aligned}$$

We also obtain

$$J_\varepsilon(u_\varepsilon, B_{\bar{r}_\varepsilon + R_\varepsilon \varepsilon}(0) \setminus B_{\bar{r}_\varepsilon}(0)) \geq \omega_{N-1} H(r') \beta_1 \varepsilon + O(\eta \varepsilon) + o(\varepsilon). \quad (3.11)$$

by methods similar to proof of (3.3).

Since $-1 \leq u_\varepsilon(r) \leq -1 + \eta$ for $r \geq \bar{r}_\varepsilon + \varepsilon R_\varepsilon$ and for sufficiently small $\eta > 0$, $-F(r, u) \geq -F(r, -1) = 0$ ($u \in [-1, -1 + \eta]$), we obtain the following estimate:

$$\begin{aligned} J_\varepsilon(u_\varepsilon, B_1(0) \setminus B_{\bar{r}_\varepsilon + R_\varepsilon \varepsilon}(0)) &\geq -\int_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}^1 r^{N-1} F(r, u_\varepsilon) dr \\ &\geq -\int_{\bar{r}_\varepsilon + \varepsilon R_\varepsilon}^1 r^{N-1} F(r, -1) dr = 0. \end{aligned} \quad (3.12)$$

Thus we obtain

$$J(u_\varepsilon) \geq A + \omega_{N-1} H(r') \beta_1 \varepsilon + O(\eta \varepsilon) + o(\varepsilon). \quad (3.13)$$

Next we give an upper bound for $J_\varepsilon(u_\varepsilon)$. Consider the following function $\bar{w}_\varepsilon$:

$$\bar{w}_\varepsilon(r) := \begin{cases} 1 & r \in [0, \bar{t} - \varepsilon] \\ 1 - \frac{\eta}{\varepsilon}(r - \bar{t} + \varepsilon) & r \in [\bar{t} - \varepsilon, \bar{t}] \\ V\left(h(\bar{t}) \frac{r - \bar{t}}{\varepsilon}\right) & r \in [\bar{t}, \bar{t} + \varepsilon R'] \\ -1 - \frac{\eta}{\varepsilon}(r - \bar{t} - \varepsilon R' - \varepsilon) & r \in [\bar{t} + \varepsilon R', \bar{t} + \varepsilon R' + \varepsilon] \\ -1 & r \in [\bar{t} + \varepsilon R' + \varepsilon, 1], \end{cases}$$

where $R' > 0$ is the number satisfying $V(h(\bar{t})R') = -1 + \eta$. Then we can see

$$J_\varepsilon(u_\varepsilon) \leq J_\varepsilon(\bar{w}_\varepsilon) \leq A + \omega_{N-1} H(\bar{t}) \beta_1 \varepsilon + O(\eta \varepsilon) + o(\varepsilon). \quad (3.14)$$

By (3.13) and (3.14) we have a contradiction. The proof of Theorem 1.1 is completed. In the more complicated case, we can show by similar method (see Remark below). $\square$

Figure 2:

Remark . We briefly show in more complicated case, that is, when a is the function as in Figure 2. More precisely we set $I_1 := [r_1, r_2]$ and $I_2 := [r_3, r_4]$ and we assume $a > 0$ on $[0, r_1) \cup (r_4, 1]$ and $a < 0$ on (r_3, r_4) .

Let $\eta > 0$ and $\theta > 0$ be small numbers. As in Part 1, we can find pairs of numbers $(\bar{r}_{1,\varepsilon}, \bar{r}_{2,\varepsilon})$ and $(R_{1,\varepsilon}, R_{2,\varepsilon})$ satisfying $\bar{r}_{1,\varepsilon} \in (r_1 - \theta, r_2 + \theta)$, $\bar{r}_{2,\varepsilon} \in (r_3 - \theta, r_4 + \theta)$, $\sup_\varepsilon |R_{1,\varepsilon}| < \infty$, $\sup_\varepsilon |R_{2,\varepsilon}| < \infty$ and

$$\begin{cases} u_\varepsilon(r) < -1 + \eta & \text{for } 0 < r < \bar{r}_{1,\varepsilon} \\ u_\varepsilon(\bar{r}_{1,\varepsilon}) = -1 + \eta \\ u_\varepsilon(\bar{r}_{1,\varepsilon} + \varepsilon R_{1,\varepsilon}) = 1 - \eta \\ u_\varepsilon(r) > 1 - \eta & \text{for } \bar{r}_{1,\varepsilon} + \varepsilon R_{1,\varepsilon} < r < \bar{r}_{2,\varepsilon} \\ u_\varepsilon(\bar{r}_{2,\varepsilon}) = 1 - \eta \\ u_\varepsilon(\bar{r}_{2,\varepsilon} + \varepsilon R_{2,\varepsilon}) = -1 + \eta \\ u_\varepsilon(r) < -1 + \eta & \text{for } \bar{r}_{2,\varepsilon} + \varepsilon R_{2,\varepsilon} < r < 1 \end{cases}$$

We assume $\bar{r}_{1,\varepsilon_j} \rightarrow \bar{r}_1 \in I_1$ and $\bar{r}_{2,\varepsilon_j} \rightarrow \bar{r}_2 \in I_2$ for some sequence $\{\varepsilon_j\}$ which converges to 0 as $j \rightarrow \infty$. In this case it is easy to show that the energy of global minimizer $J(u_\varepsilon)$ is estimated as follows:

$$J_{\varepsilon_j}(u_{\varepsilon_j}) \geq J_{\varepsilon_j}(u_{\varepsilon_j}, B_{r_2-\varepsilon}(0)) + \varepsilon_j \omega_{N-1} H(\bar{r}_2) \beta_1 + B + O(\varepsilon_j \eta) + o(\varepsilon_j), \quad (3.15)$$

where $B = - \int_{r_2}^{r_3} r^{N-1} F(r, 1) dr$.

Let us assume the result does not hold. Then $H(\bar{r}_1) > \min_{s \in I_1} H(s)$ or $H(\bar{r}_2) > \min_{s \in I_2} H(s)$ hold. We assume $H(\bar{r}_1) = \min_{s \in I_1} H(s)$ and $H(\bar{r}_2) > \min_{s \in I_2} H(s)$. We also assume $r_1 = \bar{r}_1$. We note that if $H(\bar{r}_1) > \min_{s \in I_1} H(s)$ or $\bar{r}_1 \in \text{int} I_1$, the proof is more easy.

Let we take $\tilde{r}_2 \in \text{int}I_2$ such that $H(\bar{r}_2) > H(\tilde{r}_2) > \min_{s \in I_2} H(s)$ and consider the following function:

$$\tilde{u}_\varepsilon(r) := \begin{cases} u_\varepsilon(r) & \text{on } [0, r_2 - \varepsilon) \\ 1 + \frac{\eta}{\varepsilon}(r - r_2) & \text{on } [r_2 - \varepsilon, r_2] \\ 1 & \text{on } [r_2, \tilde{r}_2 - \varepsilon] \\ 1 - \frac{\eta}{\varepsilon}(r - \tilde{r}_2 + \varepsilon) & \text{on } [\tilde{r}_2 - \varepsilon, \tilde{r}_2] \\ V\left(h(\tilde{r}_2)\frac{r - \tilde{r}_2}{\varepsilon}\right) & \text{on } [\tilde{r}_2, \tilde{r}_2 + \varepsilon R''] \\ -1 - \frac{\eta}{\varepsilon}(r - \tilde{r}_2 - \varepsilon R'' - \varepsilon) & \text{on } [\tilde{r}_2 + \varepsilon R'', \tilde{r}_2 + \varepsilon R'' + \varepsilon] \\ -1 & \text{on } [\tilde{r}_2 + \varepsilon R'' + \varepsilon, 1], \end{cases}$$

where V is the unique solution of (3.2) and R'' is the unique value such that $V(h(r_1)R'') = -1 + \eta$.

Since u_ε is global minimizer, we can estimate the energy of $J_\varepsilon(\tilde{u}_\varepsilon)$ as follows:

$$J_\varepsilon(u_\varepsilon) \leq J_\varepsilon(\tilde{u}_\varepsilon) \leq J_\varepsilon(u_\varepsilon, B_{r_2-\varepsilon}(0)) + \varepsilon\omega_{N-1}H(\tilde{r}_2)\beta_1 + B + O(\varepsilon\eta) + o(\varepsilon). \quad (3.16)$$

Then we have a contradiction from (3.15) and (3.16) by taking $\varepsilon = \varepsilon_j$ and sufficiently large j .
