

A Sharp Existence and Uniqueness Theorem for Linear Fuchsian Partial Differential Equations

Jose Ernie C. LOPE

Abstract

This paper considers the equation $\mathcal{P}u = f$, where u and f are continuous with respect to t and holomorphic with respect to z , and $\mathcal{P}$ is the linear Fuchsian partial differential operator

$$\mathcal{P} = (tD_t)^m + \sum_{j=0}^{m-1} \sum_{|\alpha| \leq m-j} a_{j,\alpha}(t, z)(\mu(t)D_z)^\alpha (tD_t)^j.$$

We will give a sharp form of unique solvability in the following sense: we can find a domain Ω such that if f is defined on Ω , then we can find a unique solution u also defined on Ω .

1 Introduction and Result

Denote by $\mathbb{N}$ the set of nonnegative integers, and let $(t, z) = (t, z_1, \dots, z_n) \in \mathbb{R} \times \mathbb{C}^n$. Let $R > 0$ be sufficiently small, and for $\rho \in (0, R]$, let B_ρ be the polydisk $\{z \in \mathbb{C}^n; |z_i| < \rho \text{ for } i = 1, 2, \dots, n\}$.

Given any bounded, open subset D of $\mathbb{C}^n$, we define by $\mathcal{A}(D)$ the Banach space of all functions $g(z)$ holomorphic in D and continuous up to $\overline{D}$; the norm in this space is given by $\|g\|_D = \max_{z \in \overline{D}} |g(z)|$. Let $T > 0$. Then we denote by $C^0([0, T], \mathcal{A}(D))$ the set of functions continuous on the interval $[0, T]$ and valued in the space $\mathcal{A}(D)$.

We say that a continuous, positive-valued function $\mu(t)$ on the interval $(0, T)$ is a *weight function* if $\mu(t)$ is increasing and the function

$$\varphi(t) = \int_0^t \frac{\mu(s)}{s} ds \quad (1.1)$$

is well-defined on $(0, T)$, i.e., the integral on the right is finite. (See Tahara [7].)

Consider now the linear partial differential operator

$$\mathcal{P} = (tD_t)^m + \sum_{j=0}^{m-1} \sum_{|\alpha| \leq m-j} a_{j,\alpha}(t, z)(\mu(t)D_z)^\alpha (tD_t)^j. \quad (1.2)$$

Here, $D_t = \partial/\partial t$ and $D_z = (\partial/\partial z_1, \dots, \partial/\partial z_n)$; $\mu(t)$ is a weight function; and the coefficients $a_{j,\alpha}(t, z)$ belong in the space $C^0([0, T], \mathcal{A}(B_R))$, i.e., for any

$s \in [0, T]$, each of the functions $a_{j,\alpha}(s, z)$, when viewed as a function of z , is holomorphic in B_R and continuous up to $\overline{B_R}$. We associate a polynomial with this operator, called the *characteristic polynomial* of $\mathcal{P}$, and we define it by

$$\mathcal{C}(\lambda, z) = \lambda^m + a_{m-1,0}(0, z)\lambda^{m-1} + \cdots + a_{0,0}(0, z). \quad (1.3)$$

Its roots $\lambda_1(z), \dots, \lambda_m(z)$ will be referred to as *characteristic exponents*. In what follows, we will assume that there exists a positive number L such that

$$\Re \lambda_j(z) \leq -L < 0 \quad \text{for all } z \in B_R \text{ and } 1 \leq j \leq m. \quad (1.4)$$

Baouendi and Goulaouic [1] studied the above operator in the case when $\mu(t) = t^a$ ($a > 0$). They called such operator a Fuchsian partial differential operator, which for them is the “natural” generalization of a Fuchsian ordinary differential operator. In their paper, they gave some generalizations of the classical Cauchy-Kowalewski and Holmgren theorems for this type of operators. Their method has been applied and extended to various cases as can be seen, for example, in Tahara [6], Mandai [5] and Yamane [8].

In a previous paper [4], the author proved existence and uniqueness theorems similar to those given in [1], but for general $\mu(t)$. Essentially, he proved the following unique solvability result.

Theorem 1. *Let $\mathcal{P}$ be as in (1.2). Then given any $\rho \in (0, R)$, there exists an $\varepsilon \in (0, T]$ such that for any $f(t, z) \in C^0([0, T], \mathcal{A}(B_R))$, the equation $\mathcal{P}u = f$ has a unique solution $u(t, z) \in C^0([0, \varepsilon], \mathcal{A}(B_\rho))$ satisfying for $1 \leq p \leq m$ the relation $(tD_t)^p u \in C^0([0, \varepsilon], \mathcal{A}(B_\rho))$.*

We remark that although $f(t, z)$, viewed as a function of z , is defined on B_R , the existence of the solution $u(t, z)$ is only guaranteed up to B_ρ , with $\rho < R$. Moreover, any two solutions of $\mathcal{P}u = f$ can only be shown to coincide in a neighborhood of the origin which is smaller than the neighborhood on which the two are defined.

In this paper, we shall present a formulation leading to an existence and uniqueness result sharper than the one given above. The result is sharper in the sense that the solution $u(t, z)$ of the equation $\mathcal{P}u = f$ will now have the same domain of definition as the inhomogeneous part $f(t, z)$.

To proceed, we will need the following definitions.

Definition 1. Let $\tau \in (0, T)$, $\gamma > 0$ and $\varphi(t)$ be the one in (1.1). We define

- (i) $\omega_\tau[\gamma] = \{z \in \mathbb{C}^n; |z_i| < R - \gamma\varphi(\tau) \text{ for } i = 1, 2, \dots, n\}$, and
- (ii) $\Omega_T[\gamma] = \{(\tau, z) \in \mathbb{R} \times \mathbb{C}^n; 0 \leq \tau \leq T \text{ and } z \in \omega_\tau[\gamma]\}$.

Definition 2. Let $p \in \mathbb{N}$ and $\gamma > 0$.

- (i) We say that $f(t, z)$ belongs in $\mathcal{K}_0(\Omega_T[\gamma])$ if for each $\tau \in [0, T]$, we have $f(t) \in C^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma]))$.

- (ii) We say that $w(t, z)$ belongs in $C_p^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma]))$ if for all $0 \leq j \leq p$, we have $(tD_t)^j w(t) \in C^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma]))$.
- (iii) We say that $u(t, z)$ belongs in $\mathcal{K}_p(\Omega_T[\gamma])$ if for each $\tau \in [0, T]$, we have $u(t) \in C_p^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma]))$.

Under the above assumptions, we now state the following main result.

Theorem 2. *Let $\mathcal{P}$ be the operator given in (1.2). Then there exist constants $T_0 > 0$ and $\gamma_0 > 0$ depending on $\mathcal{P}$ such that for any $f(t, z) \in \mathcal{K}_0(\Omega_{T_0}[\gamma_0])$, the equation*

$$\mathcal{P}u = f \quad \text{in } \Omega_{T_0}[\gamma_0] \quad (1.5)$$

has a unique solution $u(t, z)$ in $\mathcal{K}_m(\Omega_{T_0}[\gamma_0])$.

Moreover, the solution satisfies the a priori estimate

$$\sum_{p=0}^m \max_{\Delta} |(tD_t)^p u| \leq C \max_{\Delta} |f|, \quad (1.6)$$

where Δ is the closure of $\Omega_{T_0}[\gamma_0]$ and $C > 0$ is some constant dependent on the above equation and on the domain $\Omega_{T_0}[\gamma_0]$.

Note that $f(t, z)$ and $u(t, z)$ both have $\Omega_{T_0}[\gamma_0]$ as their domain of definition. This fact allows us to restate our theorem in the following manner: for any $T, \gamma > 0$, let $X_{T,\gamma}$ and $Y_{T,\gamma}$ be the spaces $\mathcal{K}_m(\Omega_T[\gamma])$ and $\mathcal{K}_0(\Omega_T[\gamma])$, respectively. Let $W_{T,\gamma}$ be the subspace of $X_{T,\gamma}$ consisting of functions $u \in X_{T,\gamma}$ such that $\mathcal{P}u$ belongs in $Y_{T,\gamma}$. Define a linear operator Ψ from $X_{T,\gamma}$ to $Y_{T,\gamma}$ with domain $W_{T,\gamma}$ by $\Psi u = \mathcal{P}u$. Let $\|\cdot\|_{T,\gamma}$ denote the maximum norm in the closure of $\Omega_T[\gamma]$. Then $X_{T,\gamma}$ and $Y_{T,\gamma}$ are Banach spaces; given $u \in X_{T,\gamma}$ and $f \in Y_{T,\gamma}$, we define their norms by $\sum_{p=0}^m \|(tD_t)^p u\|_{T,\gamma}$ and $\|f\|_{T,\gamma}$, respectively. Note further that the operator Ψ is a closed linear operator from $X_{T,\gamma}$ to $Y_{T,\gamma}$. The above theorem can now be stated as

Theorem 2'. *There exist $T_0, \gamma_0 > 0$ depending on $\mathcal{P}$ such that the operator Ψ is a one-one, closed linear operator from X_{T_0,γ_0} onto Y_{T_0,γ_0} .*

Since Ψ is an injection, Ψ^{-1} exists and is also closed. The Closed Graph Theorem further implies that Ψ^{-1} is continuous. The estimate given in (1.6) is just a consequence of the continuity of Ψ^{-1} .

2 Preliminary Discussion

We can rewrite the operator $\mathcal{P}$ as

$$\mathcal{P} = \mathcal{Q} + \sum_{j=0}^{m-1} \sum_{|\alpha| \leq m-j} c_{j,\alpha}(t, z) (\mu(t) D_z)^\alpha (tD_t)^j,$$

where the operator Q is defined by

$$Q = (tD_t)^m + a_{m-1,0}(0, z)(tD_t)^{m-1} + \cdots + a_{0,0}(0, z) \quad (2.1)$$

and

$$c_{j,\alpha}(t, z) = \begin{cases} a_{j,\alpha}(t, z) & \text{if } |\alpha| \neq 0, \\ a_{j,\alpha}(t, z) - a_{j,\alpha}(0, z) & \text{if } |\alpha| = 0. \end{cases}$$

Note that the coefficients of Q are holomorphic functions of z in B_R . Note further that the characteristic exponents of Q are the same as that of P , and hence satisfy (1.4).

Lemma 1. Fix $\tau > 0$ and let $g(t) \in C^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma]))$. Then the equation $Qu = g$ has a unique solution $u(t) \in C_m^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma]))$ given by

$$u(t) = \frac{1}{m!} \sum_{\sigma \in S_m} \int_0^t \int_0^{s_m} \cdots \int_0^{s_2} \left(\frac{s_m}{t}\right)^{-\lambda_{\sigma(m)}} \left(\frac{s_{m-1}}{s_m}\right)^{-\lambda_{\sigma(m-1)}} \cdots \times \left(\frac{s_1}{s_2}\right)^{-\lambda_{\sigma(1)}} g(s_1) \frac{ds_1}{s_1} \frac{ds_2}{s_2} \cdots \frac{ds_m}{s_m}. \quad (2.2)$$

Here, S_m is the group of permutations of $\{1, 2, \dots, m\}$.

A result in symmetric entire functions asserts that $u(t, z)$ is holomorphic with respect to z . The fact that it belongs in $C_m^0([0, \gamma], \mathcal{A}(\omega_\tau[\gamma]))$ is seen in the integral expression, but may actually be obtained *a priori*. (See [1].)

To facilitate computation, we define for $\lambda = (\lambda_1, \dots, \lambda_m)$ the function

$$G_\theta^t(\lambda) \stackrel{\text{def}}{=} \frac{1}{m!} \sum_{\sigma \in S_m} \left(\frac{s_m}{t}\right)^{-\lambda_{\sigma(m)}} \left(\frac{s_{m-1}}{s_m}\right)^{-\lambda_{\sigma(m-1)}} \cdots \left(\frac{\theta}{s_2}\right)^{-\lambda_{\sigma(1)}}, \quad (2.3)$$

for some dummy variables $s_2, \dots, s_m$. Define, too, the integral operator

$$\int_{[t;\theta]}^{(m)} g \stackrel{\text{def}}{=} \int_0^t \int_0^{s_m} \cdots \int_0^{s_2} g(\theta) \frac{d\theta}{\theta} \frac{ds_2}{s_2} \cdots \frac{ds_m}{s_m} \quad (2.4)$$

Using the above, we can now write the solution $u(t)$ of the equation $Qu = g$ as

$$u(t) = \int_{[t;s]}^{(m)} G_s^t(\lambda) g.$$

In our proof of the main theorem, it will be necessary to consider the action of the differential operator $(tD_t)^p$ on integral expressions similar to the one in (2.2). One can easily verify the following

Lemma 2. Let $u(t)$ be the solution of $Qu = g$. Then for a natural number p less than m , we have

$$(tD_t)^p u = \sum_{i=m-p}^m \int_{[t;s_1]}^{(i)} g \times \left\{ \frac{1}{m!} \sum_{\sigma \in S_m} h_i(\sigma, \lambda) \left(\frac{s_i}{t}\right)^{-\lambda_{\sigma(i)}} \times \left(\frac{s_{i-1}}{s_i}\right)^{-\lambda_{\sigma(i-1)}} \cdots \left(\frac{s_1}{s_2}\right)^{-\lambda_{\sigma(1)}} \right\}, \quad (2.5)$$

where the functions $h_i(\sigma, \lambda)$ are suitable polynomial functions of the characteristic exponents $\lambda_1(z), \dots, \lambda_m(z)$.

For brevity, let us set, for a natural number k ,

$$H_\theta^t(k, \lambda) = \frac{1}{m!} \sum_{\sigma \in S_m} h_k(\sigma, \lambda) \left(\frac{s_k}{t}\right)^{-\lambda_{\sigma(k)}} \left(\frac{s_{k-1}}{s_k}\right)^{-\lambda_{\sigma(k-1)}} \dots \left(\frac{\theta}{s_2}\right)^{-\lambda_{\sigma(1)}}. \quad (2.6)$$

By symmetry, the functions $H_s^t(k, \lambda)$ are holomorphic with respect to z and thus belong in $\mathcal{A}(B_R)$.

The next lemma is useful in evaluating some integral expressions in the proof.

Lemma 3. *Let k be natural number. Then the following equalities hold:*

$$\begin{aligned} (a) \quad & \int_0^{s_k} \int_0^{s_{k-1}} \dots \int_0^{s_1} \left(\frac{s_0}{s_k}\right)^L \frac{ds_0}{s_0} \dots \frac{ds_{k-1}}{s_{k-1}} = \frac{1}{L^k} \\ (b) \quad & \int_0^t \int_0^{s_k} \dots \int_0^{s_1} \frac{\mu(s_k)}{s_k} \frac{\mu(s_{k-1})}{s_{k-1}} \dots \frac{\mu(s_1)}{s_1} \\ & \times \left(\frac{s_0}{t}\right)^L \frac{s_0^{-1}}{[\varphi(t) - \varphi(s_0)]^k} ds_0 \dots ds_k = \frac{1}{L^k k!} \end{aligned}$$

The first equality is obvious. The second can be proved by reversing the order of integration and recalling that $t\varphi'(t) = \mu(t)$.

To estimate the derivatives with respect to z , we have the following lemma. (For a proof, see Hörmander [3], Lemma 5.1.3.)

Lemma 4. *Let the function $v(z)$ be holomorphic in B_R , and suppose there are positive constants K and c such that*

$$\|v\|_\rho \leq \frac{K}{(R - \rho)^c} \quad \text{for every } \rho \in (0, R). \quad (2.7)$$

Then we have

$$\|D_z^\alpha v\|_\rho \leq \frac{K e^{|\alpha|} (c+1)^{|\alpha|}}{(R - \rho)^{c+|\alpha|}} \quad \text{for every } \rho \in (0, R). \quad (2.8)$$

In the above, we define $(c)_p = (c)(c+1) \dots (c+p-1)$.

3 Proof of Main Theorem

Let f be any element of $\mathcal{K}_0(\Omega_{T_0}[\gamma_0])$. Here, the constants $T_0 > 0$ and $\gamma_0 > 0$ satisfy some conditions which will later be specified. For convenience, we will drop the subscript in both and instead use T and γ ; we will again use the subscript upon stating the conditions that these constants need to satisfy.

We will use the method of successive approximations to solve the equation $\mathcal{P}u = f$. Define the approximate solutions as follows:

$$u_0(t) = \int_{[t;s]}^{(m)} G_s^t(\lambda) f \quad (3.1)$$

and for $k \geq 1$,

$$u_k(t) = \int_{[t;s]}^{(m)} G_s^t(\lambda) [f - \mathcal{S}(s)u_{k-1}]. \quad (3.2)$$

Here, $t \in [0, T]$, and for brevity, we have set $\mathcal{S}(t) = \sum_{j=0}^{m-1} \sum_{|\alpha| \leq m-j} c_{j,\alpha}(t, z) \cdot (\mu(t)D_z)^\alpha (tD_t)^j$. Note that for all k , the approximate solutions $u_k(t, z)$ are defined on $\Omega_{T_0}[\gamma_0]$. Furthermore, they are continuous with respect to t and holomorphic with respect to z on this region.

For each k , we also define the sequence of functions $v_k(t) = u_k(t) - u_{k-1}(t)$, with $u_{-1} \equiv 0$. Then the $v_k(t, z)$'s are also defined on the same region as the $u_k(t, z)$'s, and are also continuous with respect to t and holomorphic with respect to z . Using the expression for $u_k(t)$, we have $v_0(t) = \int_{[t;s]}^{(m)} G_s^t(\lambda) f$ and for $k \geq 1$,

$$v_k(t) = - \int_{[t;s]}^{(m)} G_s^t(\lambda) \mathcal{S}(s) v_{k-1}. \quad (3.3)$$

To prove that the approximate solutions converge to the real solution, we will henceforth fix one $t \in [0, T]$, and estimate the functions $v_k(t)$. Let C be the bound on $[0, T] \times \overline{B}_R$ of all $c_{j,\alpha}(t, z)$, and K be the bound in $\overline{\Omega}_T[\gamma]$ of $f(t, z)$. As $G_s^t(\lambda)$ and $H_s^t(k, \lambda)$, we have for $1 \leq k \leq m$ and for some $D > 0$:

$$\sup_{z \in \overline{B}_R} |G_s^t(\lambda)| \leq \left(\frac{s}{t}\right)^L \quad \text{and} \quad \sup_{z \in \overline{B}_R} |H_s^t(k, \lambda)| \leq D \left(\frac{s}{t}\right)^L. \quad (3.4)$$

We can easily see that $\|v_0(t)\|_{\omega_t}$ is bounded by KL^{-m} for any $0 \leq t \leq T$. Here, we have written for convenience $\|\cdot\|_{\omega_t}$ in place of $\|\cdot\|_{\omega_t[\gamma]}$. For general k , we note that $v_k(t)$ is given by the iterated integral

$$\begin{aligned} v_k(t) &= (-1)^k \int_{[t;s_k]}^{(m)} G_{s_k}^t(\lambda) \mathcal{S}(s_k) \int_{[s_k;s_{k-1}]}^{(m)} G_{s_{k-1}}^{s_k}(\lambda) \mathcal{S}(s_{k-1}) \cdots \\ &\quad \cdots \int_{[s_2;s_1]}^{(m)} G_{s_1}^{s_2}(\lambda) \mathcal{S}(s_1) \int_{[s_1;s_0]}^{(m)} G_{s_0}^{s_1}(\lambda) f(s_0). \end{aligned} \quad (3.5)$$

The expression above can be expanded using Lemma 2, and thus obtain a finite sum whose number of terms is less than $(mJ)^k$, where J is the cardinality of the set $\{(j, \alpha); 0 \leq j \leq m-1 \text{ and } |\alpha| \leq m-j\}$. Each term of the finite sum

has the form

$$\begin{aligned}
I = & (-1)^k \int_{[t;s_k]}^{(m)} G_{s_k}^t(\lambda) c_{j_k, \alpha_k}(\mu D_z)^{\alpha_k} \int_{[s_k; s_{k-1}]}^{(i_k)} H_{s_{k-1}}^{s_k}(i_k, \lambda) c_{j_{k-1}, \alpha_{k-1}}(\mu D_z)^{\alpha_{k-1}} \\
& \cdots \int_{[s_2; s_1]}^{(i_2)} H_{s_1}^{s_2}(i_2, \lambda) c_{j_1, \alpha_1}(\mu D_z)^{\alpha_1} \int_{[s_1; s_0]}^{(i_1)} H_{s_0}^{s_1}(i_1, \lambda) f(s_0), \quad (3.6)
\end{aligned}$$

where for each p , the relations $m - j_p \leq i_p \leq m$ and $|\alpha_p| \leq m - j_p$ hold. (Here, α_p is a multi-index and should not be confused with the p th component of α .) The above is further equal to

$$\begin{aligned}
I = & (-1)^k \int_{[t;s_k]}^{(m)} \int_{[s_k; s_{k-1}]}^{(i_k)} \cdots \int_{[s_1; s_0]}^{(i_1)} G_{s_k}^t c_{j_k, \alpha_k}(s_k) (\mu(s_k) D_z)^{\alpha_k} \\
& \times H_{s_{k-1}}^{s_k} c_{j_{k-1}, \alpha_{k-1}}(s_{k-1}) (\mu(s_{k-1}) D_z)^{\alpha_{k-1}} \cdots \\
& \times H_{s_1}^{s_2} c_{j_1, \alpha_1}(s_1) (\mu(s_1) D_z)^{\alpha_1} H_{s_0}^{s_1} f(s_0). \quad (3.7)
\end{aligned}$$

Let $F_k(s)$ denote the integrand of the above integral. Let $R_{s_0} = R - \gamma\varphi(s_0)$. Then all the functions above, when viewed as a function of z , belong in $\mathcal{A}(\omega_{s_0}[\gamma])$. (This explains the necessity of the assumption that the coefficients be defined up to B_R , for all t in the interval $[0, T]$.)

We can therefore apply Lemma 4 repeatedly, starting from the rightmost expression, to obtain the following estimate: for any $\rho \in (0, R_{s_0})$, we have

$$\begin{aligned}
\|F_k(s)\|_{B_\rho} & \leq K(CD)^k \mu(s_1)^{|\alpha_1|} \cdots \mu(s_k)^{|\alpha_k|} \left(\frac{s_0}{t}\right)^L \times \\
& \left(\frac{e}{R_{s_0} - \rho}\right)^{|\alpha_1| + \cdots + |\alpha_k|} |\alpha_1 + \cdots + \alpha_k|!. \quad (3.8)
\end{aligned}$$

If $|\alpha_1 + \cdots + \alpha_k| = 0$, then for sufficiently small $T = T_0$, the bound for any $c_{j,0}(t, z) = a_{j,0}(t, z) - a_{j,0}(0, z)$ is actually small, since $a_{j,0}(t, z)$ is continuous with respect to t . In other words, by choosing a small $T = T_0$, we could find a small constant δ such that for any $t \in [0, T_0]$ and $0 \leq s \leq t$, the following holds:

$$\|F_k(s)\|_{\omega_t} \leq K \delta^k \left(\frac{s_0}{t}\right)^L. \quad (3.9)$$

Going back to the integral, we have

$$\begin{aligned}
\|I\|_{\omega_t} & \leq \int_{[t;s_k]}^{(m)} \int_{[s_k; s_{k-1}]}^{(i_k)} \cdots \int_{[s_1; s_0]}^{(i_1)} K \delta^k \left(\frac{s_0}{t}\right)^L \\
& = K \frac{\delta^k}{L^{m+i_1+\cdots+i_k}} \leq K \left(\frac{\delta}{L_0}\right)^k, \quad (3.10)
\end{aligned}$$

for some constant L_0 dependent on L . This is possible since $i_p \leq m$ for all p .

If $|\alpha_1 + \dots + \alpha_k| \neq 0$, set the ρ in (3.8) to be equal to $R - \gamma\varphi(t)$. This gives

$$\begin{aligned} \|F_k(s)\|_{\omega_t} &\leq K(CD)^k \mu(s_1)^{|\alpha_1|} \dots \mu(s_k)^{|\alpha_k|} \left(\frac{s_0}{t}\right)^L \\ &\quad \times |\alpha_1 + \dots + \alpha_k|! \left(\frac{e}{\gamma[\varphi(t) - \varphi(s_0)]}\right)^{|\alpha_1 + \dots + \alpha_k|}. \end{aligned} \quad (3.11)$$

By renaming if necessary, assume that for $p = 1, \dots, q$, we have $|\alpha_p| \neq 0$. Note that $q \geq 1$. We will again use the continuity of $a_{j,0}(t, z)$ to estimate those expressions which are not acted upon by D_z , i.e., the $k - q$ cases when $|\alpha_p| = 0$. Just like before, we can show that for small δ ,

$$\begin{aligned} \|F_k(s)\|_{\omega_t} &\leq K(CD)^q \delta^{k-q} \mu(s_1)^{|\alpha_1|} \dots \mu(s_q)^{|\alpha_q|} \left(\frac{s_0}{t}\right)^L \\ &\quad \times |\alpha_1 + \dots + \alpha_q|! \left(\frac{e}{\gamma[\varphi(t) - \varphi(s_0)]}\right)^{|\alpha_1 + \dots + \alpha_q|}. \end{aligned} \quad (3.12)$$

Thus, the integral I can now be estimated as follows:

$$\begin{aligned} \|I\|_{\omega_t} &\leq K(CD)^q \delta^{k-q} \left(\frac{e}{\gamma}\right)^{|\alpha_1 + \dots + \alpha_q|} |\alpha_1 + \dots + \alpha_q|! \\ &\quad \times \int_{[t; s_k]}^{(m)} \int_{[s_k; s_{k-1}]}^{(i_k)} \dots \int_{[s_1; s_0]}^{(i_1)} \left(\frac{s_0}{t}\right)^L \frac{\mu(s_1)^{|\alpha_1|} \dots \mu(s_q)^{|\alpha_q|}}{[\varphi(t) - \varphi(s_0)]^{|\alpha_1 + \dots + \alpha_q|}}. \end{aligned} \quad (3.13)$$

Let $d = m + i_1 + \dots + i_k$ and $b = |\alpha_1 + \dots + \alpha_q|$. Note that $b \geq q$. Since for each p , we have $|\alpha_p| \leq m - j_p \leq i_p$, and using the fact that both $\varphi(t)$ and $\mu(t)$ are increasing on $(0, T_0)$, we have

$$\begin{aligned} \|I\|_{\omega_t} &\leq K(CD)^q \delta^{k-q} \left(\frac{e}{\gamma}\right)^b b! \\ &\quad \times \int_0^t \int_0^{\xi_b} \dots \int_0^{\xi_1} \frac{\mu(\xi_b)}{\xi_b} \dots \frac{\mu(\xi_1)}{\xi_1} \left(\frac{\xi_0}{t}\right)^L \frac{1}{[\varphi(t) - \varphi(\xi_0)]^b} \frac{d\xi_0}{\xi_0} d\xi_1 \dots d\xi_b \\ &\quad \times \int_0^{\xi_0} \int_0^{\eta_1} \dots \int_0^{\eta_{d-b-2}} \left(\frac{s_0}{\xi_0}\right)^L \frac{ds_0}{s_0} \dots \frac{d\eta_1}{\eta_1} \end{aligned} \quad (3.14)$$

By (a) of Lemma 3, the second integral is equal to L^{-d+b+1} . Thus, the above simplifies into

$$\begin{aligned} \|I\|_{\omega_t} &\leq K(CD)^q \delta^{k-q} \left(\frac{e}{\gamma}\right)^b L^{-d+b+1} b! \\ &\quad \times \int_0^t \int_0^{\xi_b} \dots \int_0^{\xi_1} \frac{\mu(\xi_b)}{\xi_b} \dots \frac{\mu(\xi_1)}{\xi_1} \left(\frac{\xi_0}{t}\right)^L \frac{\xi_0^{-1}}{[\varphi(t) - \varphi(\xi_0)]^b} d\xi_0 \dots d\xi_b. \end{aligned} \quad (3.15)$$

The last integral is equal to $(Lb!)^{-1}$, by (b) of Lemma 3. Meanwhile, since $d \leq m(k+1)$, we can find a constant L_1 , depending on L , such that $L^{-d} \leq L_1^k$.

Substituting these results into the above equation, we get

$$\|I\|_{\omega_t} \leq K(CD)^q \delta^{k-q} \left(\frac{eL}{\gamma}\right)^b L_1^k = K\left(\frac{CD}{\delta}\right)^q (\delta L_1)^k \left(\frac{eL}{\gamma}\right)^b. \quad (3.16)$$

By taking a sufficiently small T_0 , we can find a δ small enough such that δL_1 above and δL_0^{-1} in (3.10) are both less than $(mJ)^{-1}$. Now, since $q \leq b$, we can make the remaining expression less than one by choosing a large $\gamma = \gamma_0$.

To summarize, we have shown that if T_0 is sufficiently small and γ_0 is sufficiently large, some constants $K > 0$ and $\delta_0 < 1$ exist such that for all k , we have

$$\|v_k(t)\|_{\omega_t[\gamma_0]} \leq K\delta_0^k \quad \text{for any } t \in [0, T_0]. \quad (3.17)$$

It follows that the series $\sum_{k=0}^{\infty} v_k(t, z)$ is majorized by a convergent geometric series, and hence is itself convergent in $C^0([0, \tau], \mathcal{A}(\omega_\tau[\gamma_0]))$ for all $\tau \in [0, T_0]$. This means that $u_k(t)$ converges uniformly to $u(t)$ on $\Omega_{T_0}[\gamma_0]$.

By following the steps above, we can also show that for $1 \leq p \leq m-1$, the sequence $(tD_t)^p u_k(t)$ converges uniformly to $(tD_t)^p u(t)$ on $\Omega_{T_0}[\gamma_0]$. Thus, it follows that on a compact subset of $\Omega_{T_0}[\gamma_0]$, the sequence $D_z^\alpha (tD_t)^p u_k(t)$ converges to $D_z^\alpha (tD_t)^p u(t)$. This implies the convergence of the approximate solutions to the true solution $u(t)$.

Uniqueness may be proved in a similar manner.
