

Arithmetical rank of Stanley-Reisner ideals of small arithmetic degree

Naoki Terai (Saga University)

1 Introduction

Let $R = k[x_1, \dots, x_n]$ be a polynomial ring with n variables over a field k with $\deg x_i = 1$ ($i = 1, 2, \dots, n$). In this article we determine the arithmetical rank of squarefree monomial ideals in R with small arithmetic degree. More precisely, we prove the following theorem:

Theorem. *Let I be a squarefree monomial ideal. Then we have:*

(1)

$$\text{arithdeg} I = \text{reg } I \Rightarrow \text{ara } I = \text{projdim } (R/I).$$

(2)

$$\text{arithdeg} I = \text{indeg} I + 1 \Rightarrow \text{ara } I = \text{projdim } (R/I).$$

First we fix the terminology we use in this article.

Let I be an ideal of R . We define the arithmetical rank $\text{ara} I$ of I by

$$\text{ara} I := \min\{r; \exists a_1, a_2, \dots, a_r \in I \text{ such that } \sqrt{(a_1, a_2, \dots, a_r)} = \sqrt{I}\}.$$

In general, $\text{ara} I \geq \text{ht } I$. And I is said to be a *set-theoretic complete intersection*, if $\text{ara} I = \text{ht} I$.

Let I be a homogeneous ideal in R and

$$0 \rightarrow \bigoplus_j R(-j)^{\beta_{pj}} \rightarrow \dots \rightarrow \bigoplus_j R(-j)^{\beta_{0j}} \rightarrow I \rightarrow 0$$

a graded minimal free resolution of I over R . Here p is called the *projective dimension* of I over R and denote it by $\text{projdim} I$. We have $\text{projdim } (R/I) = \text{projdim} I + 1$. Put $\mu(I) := \sum_j \beta_{0j}$,

which stands for the minimum number of generators of I . The *initial degree* $\text{indeg } I$ of I and the *relation type* $\text{rt}(I)$ of I are defined respectively by

$$\begin{aligned}\text{indeg } I &= \min\{j : \beta_{0j} \neq 0\}, \\ \text{rt } I &= \max\{j : \beta_{0j} \neq 0\}.\end{aligned}$$

And the (Castelnuovo-Mumford) *regularity* of I is defined by

$$\text{reg } I = \max\{j - i : \beta_{ij} \neq 0\}.$$

We say that I has *linear resolution* if $\text{reg } I = \text{indeg } I$.

For a simplicial complex Δ on the vertex set $V = \{1, \dots, n\}$, we mean that Δ is a collection of subsets of V such that

$$F \in \Delta, G \subset F \Rightarrow G \in \Delta.$$

We call

$$I_\Delta = (x_{i_1} \cdots x_{i_p}; i_1 < i_2 < \dots < i_p, \{i_1, \dots, i_p\} \notin \Delta)$$

the *Stanley-Reisner ideal* of Δ .

Put

$$\Delta^* = \{F \in 2^V : V \setminus F \notin \Delta\},$$

which is also a simplicial complex, and called the *Alexander dual* of Δ . We call I_{Δ^*} the Alexander dual ideal of I_Δ .

2 Arithmetical rank of squarefree monomial ideals

Let $H_i^I(R)$ be the i -th local cohomology module of R with respect to I . The *cohomological dimension* $\text{cd } I$ of I is defined to be $\text{cd } I := \max\{i; H_i^I(R) \neq 0\}$. It is easy to see $\text{ar} I \geq \text{cd } I$.

When I is a squarefree monomial ideal, the following theorem is known :

Theorem 2.1 (Lyubeznik [Ly1] see also [Te2]). *Let I be a squarefree monomial ideal.*

Then we have

$$\text{projdim } (R/I) = \text{cd } I.$$

Corollary 2.2. *Let I be a squarefree monomial ideal. Then we have*

$$\text{ara } I \geq \text{projdim } (R/I).$$

In particular, if I is a set-theoretic complete intersection, then R/I is Cohen-Macaulay.

Problem 2.3. Let I be a squarefree monomial ideal. Under what conditions do we have $\text{ara } I = \text{projdim } (R/I)$?

We do not always have $\text{ara } I = \text{projdim } (R/I)$ as the following example shows.

Example 2.4 (Yan [Ya]). Let I be the ideal in $R = k[u, v, w, x, y, z]$ generated by $uvw, uvz, vwx, uwz, uxy, uxz, vxz, vyz, wxy, wyz$. Then I is the Stanley-Reisner ideal of a triangulation of $\mathbf{P}^2(\mathbf{R})$ with six vertices. In this case, $\text{ara } I = 4$, which is proved by Yan, using the étale cohomology. On the other hand $\text{projdim } (R/I) = 3$ if $\text{char}(k) \neq 2$.

We pick up some classes for whose members the equality holds.

Proposition 2.5 ([Te3]). *Let I be a squarefree monomial ideal. If $\mu(I) - \text{projdim } (R/I) \leq 1$, then we have*

$$\text{ara } I = \text{projdim } (R/I).$$

For an ideal I in R , we define the *deviation* $d(I)$ of I by $d(I) = \mu(I) - \text{ht } I$.

Theorem 2.6 ([Te4]). *Let I be a squarefree monomial ideal of deviation 2. Then we have*

$$\text{ara } I = \text{projdim } (R/I).$$

Proposition 2.7. *Let Δ be a disconnected simplicial complex. I.e., let I_Δ be a squarefree monomial ideal with $\text{depth } R/I_\Delta = 1$. Then we have*

$$\text{ara } I_\Delta = \text{projdim } R/I_\Delta.$$

(Proof.) By [Ei-Ev] we have $n - 1 = \text{projdim } R/I_\Delta \leq \text{ara } I_\Delta \leq n - 1$.

Proposition 2.8. *Let Δ be a non-acyclic simplicial complex such that I_Δ has linear resolution. (E.g., I_Δ is a non-Cohen-Macaulay Buchsbaum squarefree monomial ideal with linear resolution.) Then we have*

$$\text{ara } I_\Delta = \text{projdim } R/I_\Delta.$$

(Proof.) By [Gr] we have $n - \text{indeg } I_\Delta + 1 = \text{projdim } R/I_\Delta \leq \text{ara } I_\Delta \leq n - \text{indeg } I_\Delta + 1$.

3 Squarefree monomial ideals of small arithmetic degree

We define the *arithmetic degree* $\text{arithdeg } I$ of a squarefree monomial ideal I by

$$\text{arithdeg } I = \#(\text{Ass } R/I).$$

For squarefree monomial ideals, we have the following relations:

Theorem 3.1 (Hoa-Trung[Ho-Tr], Stückrad, Fröbis-Terai[Fr-Te]). *Let I be a squarefree monomial ideal. Then we have*

$$\text{indeg } I \leq \text{reg } I \leq \text{arithdeg } I.$$

The arithmetical rank is known when the arithmetic degree agrees with the initial degree:

Theorem 3.2 (Schenzel-Vogel[Sche-Vo], Schmitt-Vogel[Schm-Vo]). *If a squarefree monomial ideal I satisfies $\text{arithdeg } I = \text{indeg } I$, then after a suitable change of variables, I is of the form*

$$I = (x_{11}, x_{12}, \dots, x_{1j_1}) \cap (x_{21}, x_{22}, \dots, x_{2j_2}) \cap \dots \cap (x_{q1}, x_{q2}, \dots, x_{qj_q}),$$

and $\text{projdim}(R/I) = \sum_{i=1}^q j_i - q + 1$.

Put $a_\ell = \sum_{\ell_1+\ell_2+\dots+\ell_q=\ell} x_{1\ell_1} x_{2\ell_2} \dots x_{q\ell_q}$ for $\ell = q, q+1, \dots, \sum_{i=1}^q j_i$. Then we have $\sqrt{(a_\ell; \ell = q, q+1, \dots, \sum_{i=1}^q j_i)} = I$.

Hence $\text{ara } I = \text{projdim } (R/I)$.

Now we consider the case that the arithmetic degree is equal to regularity:

Theorem 3.3. *Let I be a squarefree monomial ideal with $\text{arithdeg } I = \text{reg } I$. Then we have*

$$\text{ara } I = \text{projdim } (R/I).$$

To prove the above theorem we define the *size* of a monomial ideal I , which is introduced by Lyubeznik. Let $I = \cap_{j=1}^r Q_j$ be an irredundant primary decomposition of I , where the Q_i are monomial primary ideals. Let h be the height of $\sum_{j=1}^r Q_j$, and denote by v the minimum

number t such that there exist $j_1, \dots, j_t$ with $\sqrt{\sum_{i=1}^t Q_{j_i}} = \sqrt{\sum_{j=1}^r Q_j}$. Then $\text{size} I = v + (n - h) - 1$. Then we have:

Lemma 3.4 (Lyubeznik[Ly2]). *Let I be a (squarefree) monomial ideal in R . Then $\text{aral} I \leq n - \text{size} I$.*

The form is determined for a squarefree monomial ideal I with $\text{arithdeg} I = \text{reg} I$ as follows:

Lemma 3.5 (Hoa-Trung[Ho-Tr]). *Let I be a squarefree monomial ideal in R such that $\text{arithdeg} I = \text{reg} I$. Then after a suitable change of variables, I is of the form*

$$I = (y_1, x_{i_{11}}, x_{i_{12}}, \dots, x_{i_{1j_1}}) \cap (y_2, x_{i_{21}}, x_{i_{22}}, \dots, x_{i_{2j_2}}) \cap \dots \cap (y_q, x_{i_{q1}}, x_{i_{q2}}, \dots, x_{i_{qj_q}}),$$

and

$$\text{projdim}(R/I) = \deg \text{lcm}(x_{i_{11}}, x_{i_{12}}, \dots, x_{i_{1j_1}}, x_{i_{21}}, x_{i_{22}}, \dots, x_{i_{2j_2}}, \dots, x_{i_{q1}}, x_{i_{q2}}, \dots, x_{i_{qj_q}}) + 1.$$

Lemma 3.6. *Let I be a squarefree monomial ideal in R such that $\text{arithdeg} I = \text{reg} I$. Then we have*

$$\text{projdim}(R/I) = n - \text{size} I.$$

(Proof.) We may assume that every variable is zero divisor on R/I . Since $\text{size} I + 1 = \text{arithdeg} I = \text{reg} I$ by the above lemma, it is enough to prove to

$$\text{projdim}(R/I) + \text{reg} I = n + 1.$$

Let J be the Alexander dual ideal of I . Then we have

$$J = (y_1 x_{i_{11}} x_{i_{12}} \cdots x_{i_{1j_1}}, y_2 x_{i_{21}} x_{i_{22}} \cdots x_{i_{2j_2}}, \dots, y_q x_{i_{q1}} x_{i_{q2}} \cdots x_{i_{qj_q}}).$$

Since $\text{projdim}(R/I) = \text{reg} J$ and $\text{reg} I = \text{projdim}(R/J)$ (see [Te1]), it is enough to prove

$$\text{projdim}(R/J) + \text{reg} J = n + 1.$$

Because of the form of the ideal J , the Taylor resolution of J gives a minimal free resolution of J . Hence the last syzygy determines the regularity. Since every variable is zero divisor on R/J , $\text{reg} J = n - \text{projdim} J = n - \text{projdim}(R/J) + 1$. QED

Now Theorem 3.3 is clear by Lemmas 3.4 and 3.6.

Next we consider a squarefree monomial ideal whose arithmetic degree is one bigger than its initial degree:

Theorem 3.7. *Let I be a squarefree monomial ideal with $\text{arithdeg} I = \text{indeg} I + 1$. Then we have*

$$\text{projdim } (R/I).$$

To prove the above theorem we use:

Lemma 3.8. *Let I be a squarefree monomial ideal with $\text{arithdeg} I = \text{indeg} I + 1$. Then I is one of the following forms after a suitable change of the variables:*

(1)

$$I = (x_{11}, x_{12}, \dots, x_{1j_1}) \cap (x_{21}, x_{22}, \dots, x_{2j_2}) \cap \dots \cap (x_{q1}, x_{q2}, \dots, x_{qj_q}) \\ \cap (x_{11}, x_{12}, \dots, x_{1i_1}, x_{21}, x_{22}, \dots, x_{2i_2}, \dots, x_{p1}, x_{p2}, \dots, x_{pi_p}),$$

where $q \geq p \geq 2$, $1 \leq i_\ell < j_\ell$ ($\ell = 1, 2, \dots, p$), $j_{p+1}, \dots, j_q \geq 1$.

(2)

$$I = (x_{11}, x_{12}, \dots, x_{1j_1}) \cap (x_{21}, x_{22}, \dots, x_{2j_2}) \cap \dots \cap (x_{q1}, x_{q2}, \dots, x_{qj_q}) \\ \cap (x_{q+1,1}, x_{q+1,2}, \dots, x_{q+1,j_{q+1}}, x_{11}, x_{12}, \dots, x_{1i_1}, x_{21}, x_{22}, \dots, x_{2i_2}, \dots, x_{p1}, x_{p2}, \dots, x_{pi_p}),$$

where $q \geq p \geq 1$, $1 \leq i_\ell < j_\ell$ ($\ell = 1, 2, \dots, p$), $j_{p+1}, \dots, j_q, j_{q+1} \geq 1$.

(3)

$$I = (x_{11}, x_{12}, \dots, x_{1j_1}, y_1, \dots, y_p) \cap (x_{21}, x_{22}, \dots, x_{2j_2}, y_1, \dots, y_p) \cap (x_{31}, x_{32}, \dots, x_{3j_3}) \cap \dots \\ \cap (x_{q1}, x_{q2}, \dots, x_{qj_q}) \cap (x_{q+1,1}, x_{q+1,2}, \dots, x_{q+1,j_{q+1}}, x_{11}, x_{12}, \dots, x_{1i_1}, x_{21}, x_{22}, \dots, x_{2i_2}),$$

where $q \geq 2$, $p \geq 1$, $1 \leq i_\ell \leq j_\ell$ ($\ell = 1, 2$), $j_3, \dots, j_q \geq 1$, $j_{q+1} \geq 0$.

(Proof.) Let I be a squarefree monomial ideal with $\text{arithdeg} I = \text{indeg} I + 1$, and J its Alexander dual ideal. Then J satisfies that $\mu(J) = \text{ht} J + 1$, that is J is an almost complete intersection. Such J are classified in [Te3]. QED

(Proof of Theorem 3.7.) We check the equality for all the cases in the above lemma. Let J be the Alexander dual ideal of I .

(1) We may assume that $j_1 - i_1 = \min\{j_\ell - i_\ell; \ell = 1, 2, \dots, p\}$. Then

$$\text{projdim } (R/I) = \text{reg} J = i_1 + j_2 + \dots + j_q - q + 1.$$

Put $a_\ell = \sum_{\substack{\ell_1+\ell_2+\dots+\ell_q=\ell \\ \ell_1 \leq i_1 \text{ or } \ell_2 \leq i_2 \text{ or } \dots \text{ or } \ell_p \leq i_p}} x_{1\ell_1} x_{2\ell_2} \cdots x_{q\ell_q}$ for $\ell = q, q+1, \dots, i_1 + \sum_{t=2}^q j_t$. Then we have $\sqrt{(a_\ell; \ell = q, q+1, \dots, i_1 + \sum_{t=2}^q j_t)} = I$ by [Schm-Vo, Lemma]. Hence $\text{ara } I = \text{projdim } (R/I)$.

(2) By Theorem 3.3 the equality holds in this case.

(3) (i) The case of $j_{q+1} > 0$. By Theorem 3.3 the equality holds.

(ii) The case of $j_{q+1} = 0$ and $i_\ell < j_\ell$ ($\ell = 1, 2$). We may assume that $j_1 - i_1 \leq j_2 - i_2$. Then

$$\text{projdim } (R/I) = \text{reg } J = i_1 + j_2 + \cdots + j_q - q + 1 + p.$$

For simplicity, we mean that $x_{1j_1+i} = y_i$ and $x_{2j_2+i} = y_i$ for $i = 1, 2, \dots, p$.

Put $a_\ell = \sum_{\substack{\ell_1+\ell_2+\dots+\ell_q=\ell \\ \ell_1 \leq i_1 \text{ or } \ell_2 \leq i_2}} x_{1\ell_1} x_{2\ell_2} \cdots x_{q\ell_q}$ for $\ell = q, q+1, \dots, i_1 + \sum_{t=2}^q j_t + p$. Then we have $\sqrt{(a_\ell; \ell = q, q+1, \dots, i_1 + \sum_{t=2}^q j_t + p)} = I$ by [Schm-Vo, Lemma]. Hence $\text{ara } I = \text{projdim } (R/I)$.

(iii) The case of $j_{q+1} = 0$ and ($i_1 = j_1$ or $i_2 = j_2$). We may assume that every variable is a zero divisor on R/I . Then R/J is Cohen-Macaulay with $a(R/J) = 0$. Hence by Proposition 2.8 the equality holds in this case. QED
